1 STATE OF MICHIGAN:

To the circuit court for the county of Wayne:

Your petitioner, The Fort Street Union Depot Company, respect-

fully represents:

1. That your petitioner is a railroad corporation, organized under an act entitled, "An act to authorize the incorporation of companies for the construction of union railroad depots and stations, with the necessary connecting tracks, and the management of the same," approved June 9, 1881, and the amendments thereto; that your petitioner heretofore, to wit, on the 24th day of August, 1889, was duly incorporated by the filing of its articles of association, and annexed affidavit, in the office of the secretary of state, as required by said act.

2. That the capital stock of your petitioner has been in good faith subscribed, as required by said act, to organize such company; that is to say, the capital stock of your petitioner is fixed by said articles of association at the sum of one million dollars, which was not less than the estimated and probable cost of your petitioner's proposed station grounds, depot buildings and railroad tracks proposed to be laid; that more than fifty per cent. of said capital stock was subscribed upon said articles of association, and ten per cent. was in good faith in cash paid in to the directors named in said articles, and an affidavit was made and attached to said articles by William W. Crapo and George Coppell, two of said directors, showing that said amount had been subscribed, and ten per cent. in cash paid in as aforesaid.

3. That your petitioner has surveyed its depot grounds and the route of its proposed tracks in the county of Wayne, and made a map and survey thereof, by which said depot grounds and route are designated, and that it has located the same according to such survey, and filed a certificate thereof, indorsed on such map and survey, and signed by a majority of the directors of said company, in the register's office of said county of Wayne, to wit, on the 12th, day of November, 1889; that before filing said map and survey,

to wit, on the 22d day of October, 1889, your petitioner submitted the same to the State railroad crossing board, consisting of the commissioner of railroads, attorney general and

ing of the commissioner of railroads, attorney general and secretary of state, for approval, in compliance with section seven of the general railroad law of this State, as amended by act No. 236 of the Public Acts of 1887, p. 294; that thereupon such proceedings were had that afterwards, to wit, on the 8th day of November, 1889, said map and survey was duly approved by said board, and a certificate of such approval indorsed thereon, and said map and survey, so certified and approved, now remains of record in the said register's office for the county of Wayne, and to which record reference is hereby made.

4. That the route of the proposed tracks of your petitioner, as shown by said map and survey, lies upon and along River street, in said city of Detroit, from a point at or near Twelfth street to a

1 - -55

point at or near Eighth street, and the terms and conditions under which your petitioner is to construct its said tracks upon and along said River street, have been agreed upon between the common council of the city of Detroit, and your petitioner, as shown by the following ordinance adopted by the common council and accepted by your petitioner:

Copy of Ordinance.

"Whereas, the Fort Street Union Depot Company is a corporation under the laws of this State, for the construction of a union depot on the southwest corner of Third street and Fort street west, in this city, and said company, for the purpose of furnishing access to said union depot, propose to build an elevated railroad in, upon and along River street, from the west line of the Thompson farm

to the east line of lot number ten (10) of the Labrosse farm; thence northeasterly to a point south of Fort street, north of Congress street and west of the west line of Seventh street; thence across Seventh, Sixth, Fifth and Fourth streets, between Fort

and Congress streets; and,

Whereas, the act under which said depot company is organized provides that the terms and conditions under which said elevated railroad may be constructed in any street shall be agreed upon between the company and the common council, and,

Whereas, the construction of said road may render it necessary to vacate Fourth, Fifth, Sixth or Seventh streets, between Fort and Congress streets, or to change the grade of Sixth or Seventh streets;

therefore,

SECTION 1. It is ordered that the terms and conditions for the construction of said railroad along River street shall be as follows:

That is to say, the superstructure of said elevated railroad shall be supported by iron posts not more than 15 inches square or in diameter; that said posts shall be set along the line of the curbing now in said highway, and outside of the roadway and curbing, so that the superstructure will span the entire roadway or paved portion of said highway; said posts shall be not less than 30 feet apart along said curb lines, except in crossing the Michigan Central railroad, where they shall be so placed as to be most convenient for both roads; said posts shall rest wholly upon solid foundations of masonry wholly beneath the surface of the street, and such posts shall be of such length that at no point on the line of the said road shall the space between the surface of said River street, or any street leading into said River street, and the superstructure be less than

13 feet in the clear, and no posts shall be placed within or between the curb lines of any street leading into or intersecting said River street, or within the lines of the sidewalk upon

such intersecting streets.

In case said roadway shall be constructed across and over any of the said Fourth, Fifth, Sixth or Seventh streets, the superstructure shall be supported either by stone walls, erected on the street lines, or by iron posts not more than 15 inches square or in diameter, which shall be set so as to span the entire roadway of said streets,

and none of which shall be set between the curb lines of either of said streets, or within the sidewalk lines thereon; the said posts shall rest upon solid foundations of masonry wholly beneath the surface of said streets, and at no point on either of said streets, provided the roadway shall be constructed over either of said streets, shall the space between the surface of the street and the super-structure be less than 13 feet clear under said structure; and,

The superstructure shall consist of iron and steel girders and ties, having an aggregate height of five feet, substantially as shown on the "cross-section" thereof, filed by said company with the city clerk, with a map showing the route of said railroad along said River street and the location of the posts for the support, and which said cross-section and map are made a part of this ordi-

nance.

Suitable iron pans or shields to catch the ashes and refuse from locomotives shall be constructed upon the tracks of said elevated railroad, on and along River street, and over any other street above which said roadway shall be constructed. And the said company shall cause to be properly lighted to the satisfaction of the board of public works the said River street under said superstructure, and any street crossing over which said roadway may be con-

structed.

5 Sec. 2. The said company shall keep the posts and superstructure of said elevated railroad in good order and repair, and in constructing the same shall obstruct the streets for a reason-

able time only.

SEC. 3. In case the common council should, in its discretion, at any time hereafter resolve and determine to vacate the said Fourth, Fifth, Sixth and Seventh streets, or either or any of them, and take the necessary steps and proceedings to vacate the said streets or either of them, and the same or either of them should be vacated, the said Fort Street Union Depot Company shall pay all the costs and expenses of such proceedings, and shall pay all damages which may be awarded in said proceedings to any person or persons by reason of such vacation.

Sec. 4. In case the said roadway should be constructed by said company over the said Fourth, Fifth, Sixth or Seventh streets, or over either of said streets, at a height leaving a space less than 13 feet in the clear between the present surface of such street and the superstructure of said roadway, and the common council should, in its discretion, at any time hereafter, resolve and determine to change the grade of either or any of said streets and the same be changed, the said Fort Street Union Depot Company hereby agree to pay all the costs and expenses of such change and alteration of grade, and to pay all damages that may be awarded to any person or persons by reason of change of grade, and fully to indemnify the city against any and all claims, awards or judgments that may be recovered against the city by reason of such change of grade.

Sec. 5. The said company shall acquire by purchase or condemnation, from the adjoining property-owners, the right to build

6 said elevated railroad in said street as required by the constitution and laws of the State.

Sign. 6. In consideration of the police and fire protection, and in lieu of local taxes, the said company shall, and it hereby agrees to pay to the city treasurer, on or before the 1st day of July in each year, two and one-half per cent. of the gross earnings of said company, as determined by the State railroad commissioner and auditor general, in pursuance of sections 19, 20 and 21 of the Union Depot act of 1881. Provided, that if by any change in the constitution or laws of this State, the company should hereafter be required to pay local taxes, then the company is to be credited upon the percentage herein stipulated, with the amount of local taxes it may be required to pay.

Sec. 7. The said company shall within thirty (30) days after the passage of this ordinance file a written acceptance of the terms and conditions thereof with the city clerk, and shall procure from the owner or owners thereof, a deed to the city of Detroit, dedicating to the public use as a street, all that parcel of land in the city of Detroit, in the county of Wayne and State of Michigan, from River street to the channel bank of the Detroit river, included between the lines of Twelfth street extended, except the part thereof owned by the Michigan Central Railway Company, and the same to be kept open and clear for public use, and shall cause said deed to be filed with the controller of the city; and

Said company shall execute and deliver to the city of Detroit, a good and sufficient bond, in the penal sum of \$500,000, to be approved by the common council, conditioned for the faithful perform-

ance of the terms and conditions of this ordinance, and to
fully indemnify and save harmless the city of Detroit, from
any and all claims for damages for which said city may be
made or become liable to pay, by reason of the construction, maintenance or operation of said railroad or superstructure. This ordinance shall take effect upon the filing of said acceptance, the deliv-

ery of said deed and the approval of said bond."

5. That at the time of approving the map and survey of your petitioner, to wit, on the 8th day of November, 1889, the State railroad crossing board made an additional and further order requiring the Michigan Central Railroad Company and the Fort Street Union Depot Company to construct and maintain at their joint and equal expense, an overhead passageway for teams and travelers on foot, at the crossing of River street by the tracks of the Michigan Central railroad, and afterwards, to wit, on the 30th day of April, 1890, the commissioner of railroads, in his separate official capacity, made an order to the same effect and caused the same to be served on each of said companies. Reference is hereby made to said orders as they remain of record in the office of the commissioner of railroads. That each of said orders reserved to the commissioner of railroads the power to approve of the plans of the superstructure of the viaduct or elevated railroad to be erected in River street at said railroad street crossing by your petitioner, and also of the plans of the superstructure of the passageways for teams and travelers on foot, to be erected by

the Michigan Central Railroad Company and your petitioner at

their joint and equal expense.

6. That afterwards, to wit, on the 15th day of July, 1890, your petitioner submitted plans for the construction of said overhead crossings to the Hon. John T. Rich, commissioner of rail8 roads, for his approval, and after a full hearing thereon, he did approve of said plans, and indorsed his approval thereon, and filed the same so endorsed in the office of the commissioner of railroads; and he also delivered a duplicate original of said plans

railroads; and he also delivered a duplicate original of said plans and indorsement to your petitioner, and the same are now in its possession, ready to be produced and proven as the court may

direct.

7. That your petitioner has also prepared and adopted plans for the construction of its proposed viaduct or elevated railroad in said River street from a point near Twelfth street to a point near Eighth street, and said plans conform to the said ordinance, the orders of the State railroad crossing board and of the commissioner of railroads, and the crossing plans approved by the commissioner of railroads.

The plans so adopted by your petitioner are made a part of this

petition, and a copy thereof is herewith filed and served.

8. That your petitioner desires to build said viaduct or elevated railroad and to construct the same in accordance with the terms and conditions, and in full compliance with all of the requirements, of the ordinance agreed upon between the common council of the city of Detroit and your petitioner as aforesaid, the orders of the State railroad crossing board and of the commissioner of railroads, the crossing plans approved by the commissioner of railroads, and the general plans designed and adopted by your petitioner as aforesaid.

That your petitioner also desires, and holds itself in readiness, to join with the Michigan Central Railroad Company in the construction of said passageways for teams and foot travelers, and to pay its

half of the cost and expense thereof.

9. That the Michigan Central Railroad Company owns all the property on the south side and some of the property on the north side of River street, between Twelfth street and Third street, and your petitioner has acquired from the Michigan Central Railroad Company, by due condemnation proceedings, the right to construct said viaduct or elevated railroad along said River street, as herein proposed, and your petitioner now desires to acquire the like right from the owners of the remaining property on the north side of said street, in front of said proposed viaduct or elevated railroad.

10. That of the property so situated on the north side of said River street, one parcel is known as the Backus box factory and planing mill. This property has a frontage on River street of two hundred and thirty-eight and 100 feet; and it extends from River street the same or a greater width to Fort street west and the right of way of the Michigan Central Railroad Company. The River Street frontage of the property is bounded on the west by a lot owned or known as the property of Barbara Steadley, and on the east it is

bounded by a strip of land seventeen feet wide, owned and occupied

by the Michigan Central Railroad Company.

11. That the names and places of residence of the parties, so far as the same can with reasonable diligence be ascertained, who own, or have or claim to own, or have estates or interests in said lands and property are as follows:

The property is owned in fee by Absalom Backus, Jr., of Detroit, in said county, and it is in possession of a corporation known as "A. Backus, Jr., & Sons," also of Detroit, in said county, as the

tenant for a term of years of said owner.

The estate of the late Crozier Davison is interested in a portion of said property under a land contract executed by the deceased to Absalom Backus, Jr., to the amount of about fifteen thousand dollars, and this interest, which is in the nature of mortgage, is held by James N. Dean, of Detroit, and William H. Davison, of Greenfield, in said county, as executors and trustees under the will of said Crozier Davison.

12. That your petitioner seeks to acquire under this petition, in the county of Wayne, and from the said owners, and others above named who own or have or claim to own, or have or claim to have estates or interests in the lands and property above described, the following real estate, property, easements, rights and franchises,

that is to say:

I

The right of way to construct and maintain said viaduct or elevated railroad in, upon and along River street, and in front of the above-described property, in accordance with the ordinance agreed upon between the common council of the city of Detroit and your petitioner as aforesaid, the orders of the State railroad crossing board and of the commissioner of railroads, the plans approved by the commissioner of railroads, and the general plans designed and adopted by your petitioner as aforesaid.

13. That all of the real estate, property, franchises and easements set forth and described in the preceding paragraph of this petition are required by your petitioner for the purposes of its incorporation and the taking thereof is necessary for the public use; that the union depot and station grounds proposed by your petitioner, and

the proposed railroad tracks connecting therewith, are a necessary public improvement, and public necessity requires
that all of said real estate, property, franchises and easements, and all of the estate, right, title and interest of the said
owners and others interested therein, as herein described and set
forth, should be taken for said improvement and for the use and

benefit of the public.

14. That your petitioner has not been able to acquire title to the said real estate, property, franchises and easements, and that the reason of such inability is this, that your petitioner has been unable to agree with the said Absalom Backus, Jr., and A. Backus, Jr., & Sons for the purchase thereof, there being a great difference between them and your petitioner as to the price or compensation that your petitioner ought justly to pay for the same.

Prayer.

Your petitioner prays that an order may be granted by the court appointing three disinterested and competent freeholders, as commissioners under the constitution and laws of this State, to ascertain and determine the public necessity for taking said real estate, property, franchises and easements for the purposes of your petitioner and the public use and benefit, as aforesaid, and to appraise and determine the damages or compensation to be allowed to the said owners of, and parties interested in, the said real estate, property, franchises and easements, so proposed to be taken.

F. A. BAKER, Attorney for Petitioner.

STATE OF MICHIGAN, County of Wayne, 88:

On the 24th day of January, 1891, before me, a notary public in and for said county, personally appeared Fred. A. Baker, the person who signed the above and foregoing petition, and made oath that he is the attorney for said petitioner, and signed said petition on its behalf; that he has read said petition and knows the contents thereof, and the same are true of his own knowledge, except the matters and things therein stated to be on information and belief, and as to those he believes the same to be true.

WILLIAM E. FENWICK, Notary Public, Wayne County, Mich.

To Absalom Backus, Jr., A. Backus, Jr., & Sons, and James N. Dean, William H. Davison, executors and trustees, etc.:

You will please take notice that on Monday, the 7th day of February, 1891, at the court-room in the city hall, in the city of Detroit, at the opening of court on that day, or as soon thereafter as counsel can be heard, a petition of which the within and foregoing is a true copy, will be presented to the circuit court for the county of Wayne, and at which time and place you are required to show cause, if any you have, against the prayer of said petition.

F. A. BAKER, Attorney for Petitioner.

Detroit, January 24, 1891.

Endorsed: Filed Jan. 24, 1891. Wm. E. Fenwick, d'p'y clerk.

13 STATE OF MICHIGAN:

In the Circuit Court for the County of Wayne.

FORT STREET UNION DEPOT Co., Petitioner,

A. BACKUS, JR., & Sons, A Corporation, et al., Respondents.

In the matter of the petition of the Fort Street Union Depot Company to acquire the right of way to construct and maintain a viaduct or elevated railroad upon and along River street, in the city of Detroit, county of Wayne and State of Michigan.

And this respondent, A. Backus, Jr., & Sons, a corporation, severally answering and reserving all right of exceptions to the said petition filed herein, neither admitting nor denying the matters set up in said petition save as set up in paragraph 14, and as to the matters therein set up it denies that it has refused to sell its interest in the parcels of land described in said petition to the petitioner for a reasonable and just price and compensation, and denies that the petitioner has negotiated with it for the same or made any effort to agree with it for the same.

Wherefore it prays that the said petition of the Fort Street Union

Depot Company may be dismissed.

14 STATE OF MICHIGAN:

In the Circuit Court for the County of Wayne.

FORT STREET UNION DEPOT Co., Petitioner, vs.

ABSALOM BACKUS, JR., et al., Respondents.

In the matter of the petition of the Fort Street Union Depot Company to acquire the right of way to construct and maintain a viaduct or elevated railroad upon and along River street, in the city of Detroit, county of Wayne, and State of Michigan.

And this respondent, Absalom Backus, Jr., severally answering and reserving all right of exception to the said petition, neither admitting or denying the matters set up in the said petition save as set up in paragraph 14, and as to the matters therein set up he dedies that he has refused to sell his interest in the parcels of land described in said petition to the petitioner for a reasonable and just price and compensation, and denies that the petitioner has ne-

gotiated with him for the same or made any effort to agree with him for the same.

Wherefore he prays that the said petition of the Fort Street Union Depot Company may be dismissed.

ABSALOM BACKUS, JR., By HENRY N. BACKUS,

Attorney-in-fact.

DICKINSON, THURBER & STEVENSON, Attorneys for Respondent, Absalom Backus, Jr.

Endorsed: Filed Feb'y 9, 1891. Wm. E. Fenwick, d'p'y cl'k.

On the preliminary hearing, no sufficient cause being shown to the contrary, the prayer of the petition was granted. The respondents demanded a jury. A jury was selected and sworn. They reported to the court that they were unable to agree on a verdict. The following is a copy of their verdict:

STATE OF MICHIGAN:

In the Circuit Court for the County of Wayne.

THE FORT STREET UNION DEPOT Co., Petitioner,

Absalom Backus, Jr., A. Backus, Jr., & Sons, James N. Dean, and William H. Davison, Respondents.

To said court:

We, the undersigned, inhabitants and freeholders of the county of Wayne, duly empannelled and sworn as jurors in this cause to ascertain and determine the necessity of taking for public use, to wit, for the purpose of constructing and operating a union railroad depot and station grounds in the city of Detroit, in said county. with the necessary connecting railroad tracks and accom-odations, all of the real estate, property, franchises, rights, easements, and privileges described in the petition in this cause, to wit, the property of the respondents in River street for the distance of an abutting frontage of two hundred and thirty-eight feet on the north side of said street, and to ascertain and determine the compensation or damages which ought justly to be made by the Fort Street Union Depot Company to the above-named respondents therefor, do respectfully certify and report that we met at the court-room, in the market building, in the city of Detroit, on the third day of March. 1891; that the Fort Street Union Depot Company appeared by F. A. Baker, its attorney, and the respondents appeared by Don M.

Dickinson, their attorney; that we then proceeded to hear the proofs and allegations of the parties, and also proceeded together to view the premises proposed to be taken, and for that purpose we continued our sessions from day to day until the 16th day of March, 1891, when said cause was submitted to us by said parties; that we caused the testimony and the arguments of

2 - 55

the counsel given before us to be stenographically reported and reduced to writing at the request of the parties, and the same are herewith returned and filed. After said cause was submitted to us, having maturely considered the proofs and allegations of the parties and the arguments of counsel thereon, we did fail to agree upon a verdict upon the issues submitted to us.

Dated Detroit, March 18, 1891.

M. P. HURLBUT.

A second jury was then selected and sworn, and the following is the testimony and proceedings before such jury on the second trial:

THE FORT STREET UNION DEPOT CO. vs.
ABSALOM BACKUS, JR., et al.

Second trial, commenced June 10, 1891.

Mr. Baker: Mr. Foreman and gentlemen of the jury, this is a condemnation case instituted by the Fort Street Union Depot Company to condemn a right of way for the construction of an elevated railroad on River street in front of property that is known as the Backus planing mill and box factory. The elevated road is to extend from the vicinity of Twelfth street to the vicinity of Eighth street, longitudinally along River street. The company is the corporation organized under the union depot act that was passed in this city in 1881. The purpose of the corporation, as authorized by the act, and its articles of association, is to erect and maintain a union depot or passenger-house, with the necessary connections, yards, tracks and facilities for the transaction of a railroad business, at the corner of Third street and Fort street west in this city.

The depot grounds themselves consist of two blocks and a half, bounded on the easterly end by Third street, on the northerly by Fort street, and on the southerly by Congress street west for two blocks, and in addition to that, at the extreme end, there is a half block which merely comes from Fort street to the alley, and extends from Fifth street to Sixth street. It is proposed to connect these depot grounds with the system of railroads that now terminate upon the old union depot grounds at the foot of

Twelfth street, with such additional lines coming in there in the

immediate future as are to be accommodated in this depot.

I may say in this connection that the Fort Street Union Depot Company is a corporation organized by people connected with four different railroad companies. These railroad companies propose to use this depot for passenger purposes, and two of the companies propose to use a small freight-house on the corner of Congress street west and Third street. One of the companies is the Flint & Pere Marquette railroad, which now commences at Monroe or Toledo, and goes through to Saginaw, and from there across to Ludington, and a company that has been accustomed, for the last ten or fifteen years, to come into Detroit over the Michigan Central from Wayne. They now propose to come into the city of Detroit from their line at Plymouth, coming in over the Detroit, Lansing & Northern, and connecting near the vicinity of Woodmere cemetery with the Wabash This arrangement is made possible from the fact line at Delray. that the Detroit, Lansing & Northern is one of the companies that also desires to use this depot. That line runs from Detroit to Howard city with a branch to Grand Rapids, and they also have branch

lines that run through to Saginaw by the way of Lansing and in that section of the State. These two companies, the Detroit & Lansing and the Flint & Pere Marquette, have

been heretofore accommodated with the Michigan Central depot, but it has been under peculiar circumstances and peculiar conditions, and the business of the State and of these roads has developed to such an extent that it is no longer desirable; and it will appear by the testimony in this case that it is necessary for these companies, both in their own interest, and in the public interest, to have railroad facilities at some other place than in the Michigan Central. It will appear that the Michigan Central has been in the habit, in making a lease, to accommodate other railroad companies, to insist upon provisions by which those companies were prohibited from competing with the Michigan Central at competing points. For instance, if the Detroit & Lansing desires to use the Michigan Central yard, it can only do so by agreeing that it will not compete with the Michigan Central for Grand Rapids business, the Michigan Central having a line into Grand Rapids through what is known as the Valley City line from Jackson. At any rate, these companies are not satisfied with the facilities furnished at the Michigan Central depot, either the passenger facilities or the freight facilities, and they have each agreed to take one-quarter of the stock in the Fort Street Union Depot Company, to advance one-quarter of the money that may be necessary to go on and construct a suitable union passenger-house for the accommodation of themselves, and the other companies interested at the corner of Third street and Fort street west.

The other two companies that are interested in this enterprise are the Wabash system and the Canadian Pacific. The Wabash has been in the habit, since it came to the city of Detroit, since the line was built through from Butler, Indiana, to this city, of doing their entire business at the union depot

grounds that were started in '81 and '82 at the foot of Twelfth street; but experience with the business since then has demonstrated beyond question that the foot of Twelfth street is not a suitable place for a passenger-house in this city, either in the interest of the company, or in the interest of the traveling public or of this city. The old union depot company that furnishes facilities upon those grounds for the Wabash, is owned largely by Detroit gentlemen. Mr. James F. Joy, who is connected as a director with the Wabash road, is one of the principal stockholder; Senator McMillan is another large stockholder; and Christian H. Buhl and Allan Shelden are stockholders of the old union depot company, and they agreed to advance money. The Wabash Company, as we all know, was in embarrassed circumstances and unable to advance the money, and these gentlemen made an agreement for advancing one-quarter that is being furnished for the Wabash part of it.

The Canadian Pacific is a railroad company that has had the prestige of the aid of the Canadian government, and they have built a very important and a very long line of railroad in the Dominion, and in the British possessions, extending, practically, across the continent. They desired to come to the city of Detroit, for the purpose of doing business with this city, and they therefore desired to build a line from London, or some point in Canada, to Windsor, opposite this city, if they could obtain proper depot accommodations in this city. It will appear that they came here and looked at the

situation, and were not willing to put in any money in an enterprise of this kind unless they were furnished as good facilities and as good accommodations as any other company in the city, and it was through their suggestion, to some extent, that this location was decided upon as a proper location for the union depot, to accommodate them and to accommodate the other

companies that are interested in the enterprise.

They organized under the union depot act of this State, as they were authorized to do. They made a map and survey of the union depot grounds, something like five acres, on the corner of Third street and Fort street west; they laid out a route by which those depot grounds were to be connected with the railroad system of the country. That route extends from these grounds diagonally through to River street, and then along River street to Twelfth street, and into the grounds of the old union depot company, and through those grounds down to the vicinity of Mr. Backus' lumber yard, to a connection with the Wabash line at that point, running out upon that line to Delray, or the vicinity of Woodmere cemetery, where the connection can be made with the Flint & Pere Marquette and the Detroit & Lansing.

The Fort Street Union Depot Company have acquired the title, either by deed or by condemnation proceedings, of all of the station grounds, the two blocks and a half that are necessary for the purpose of erecting a suitable passenger-house, with a yard in which trains can stand, and the business of the companies can be transacted. They have also acquired the entire right of way from those depot grounds down to Eighth street, and have also acquired nearly

all the right of way as against abutting property-owners along River street. There are only two or three parcels of property that remain uncondemned, and among them is the property that you are to pass upon, the planing mill and box factory

of A. Backus, Jr., & Sons.

Under the constitution of this State, one of the questions that you will be called upon to decide is the question of the public necessity of taking the right of way along River street for the purpose of this enterprise. The constitution of this State provides that a jury of freeholders may be selected at the instance of the property-owners for the purpose of having the question of the public necessity determined, and if the jury find in favor of the necessity, finding that it is necessary to take the property in the public interests, and for the public benefit and for the public use, to assess the damages that are sustained by the property-owners.

In regard to the question of whether it is necessary to lay out this railroad along River street, I desire, at this point, to call your attention and to lay before you what I expect to prove as to the neces-

sity of this particular condemnation.

We shall show you in the first place, by the engineer of the company, who has examined the property in that vicinity, with reference to the selection of the proper route, that the route along River street is the most suitable and the most desirable, for the reason that River street, being at a considerable lower grade than Fort street west, or the property adjacent to Fort street west, you can start on a level at Fort street west at the corner of Third street, and when you reach River street, in the vicinity of Eighth street, you can be eighteen or nineteen feet above River street, enabling the engineers to construct along River street what is known as an elevated rail-

road or viaduct. The utility of an elevated road in a large city and in such a location as this is manifest, considering the

exigencies and the necessities that surround the conduct of any railroad to a populous and thickly settled vicinity. For instance, one of the difficulties in operating a railroad in this or any other city, where you come into the city so as to be convenient to the public, is the difficulty that arises from having a large number of grade crossings. On the D. & M. we have quite a number of grade crossings. At Woodward avenue we have a number of grade crossings, at Gratiot avenue, at Michigan avenue and at River street, and there are some other grade crossings out towards West Detroit. Any sort of a superstructure that will enable you to dispose of those grade crossings is of great public utility in two ways. In the first place, it reduces the danger to the public and the passengers in the railroad trains. It enables the railroad to proceed at a fast rate of speed with their trains and to transact the business for the accommodation of the public more safely and more advantageously and more beneficially.

At the same time, where you have elevated crossings of this kind you avoid the danger to the people who are traveling along the street, either on foot or with vehicles, and every year there are quite a number of people, I would not undertake to say how many,

killed at the grade crossings in this city, and as the city becomes more populous, and the traffic along the street and the traffic on the railroad increases, of course the danger is constantly increasing; but with an elevated structure built along any portion of the city, either in a public highway or outside of the public highway, you can cross all intervening streets with an overhead structure, so as to avoid the danger both ways.

It is proposed in this case to go along River street with such a superstructure, and you will see that it enables all of the intervening streets that intervening

24 tervening streets that intersect River street from these union depot grounds to Twelfth street to be unobstructed by this superstructure, because you can drive right along these streets into River street, and, longitudinally, along River street the same as be-The superstructure along that street, under the ordinance, is not to be less than thirteen feet high in the clear. According to the plans, it will be fourteen feet and more in the clear. The lowest point it will be in River street at any point will be fourteen feet. erected upon posts that are to be set along the line of the curbstone, so that the entire paved portion of the street is to be left unobstructed and open, so that you can drive a large load of lumber, or a large load of any kind, a load of chairs, or a load of hay, or anything of that kind right along under the superstructure without the least physical obstruction. Those of you who have been in New York since the elevated railroad has been in operation, will understand how easily and with what facility traffic can be carried on under such a superstructure. The posts are to be thirty-five feet apart longitudi-They are opposite each other and are spanned by lateral girders, and those lateral girders support longitudinal girders, on which the rails are laid.

This case has been tried once before by the same counsel who are interested in the case at the present time, and the only question in regard to this right of way, I apprehend, that will be raised before you, will be a question that our distinguished friend, Mr. Don M. Dickinson, raises, as to the advisability or the public necessity of going along River street with this superstructure, his contention being that we should go over the property of the Michigan Central

Railroad Company, which joins River street upon the south. The Michigan Central Railroad Company owns all the prop-25 erty from Third street through to Twelfth street. Upon that subject we shall introduce these facts before you, that the Michigan Central Railroad Company uses, and is in occupancy, and in the actual use of every particle of that property from one end of their depot grounds to the other. In fact, that yard has been utterly inadequate for the transaction of their large, accumulating and increasing business, and they have practically made a railroad yard of their entire line from River street out to West Detroit, and use it now practically as one great long railroad yard; and at West Detroit they have acquired something like one hundred acres of land, on which they do a very large freight business, where the freight trains do their immense freight traffic. Of course, they also do a large freight business on these grounds at the foot of Third street.

We shall show you that they are in the actual use of all that property, and that they need it for the purpose of transacting the business that this company does transact at the present time. We do this under a statute which will be read to you, which provides in substance that if these grounds are in actual use by that company, or are needed by them, the property cannot be condemned, but if any portion of this property were not in actual use, then we could condemn the right of way across the grounds of another company. We would have to show that they did not need it, and would not need the property in the immediate future for the transaction of their business. Of course, any one can see that the business of the Michigan Central is on the increase, and will increase as long as the State of Michigan and this country increases in population. So that we shall show to you that it is a legal impossibility for the Fort

Street Union Depot Company, or any other railroad company of this State, under existing legislation, to condemn any right of way across the Michigan Central property. The act provides that we could not condemn the property across there when the conditions are such as I have indicated, but, if it were so that we could condemn the property, the question of necessity and value and the need of the company for the property shall be determined by jury, but the first requisite of any such condemnation proceedings is the existence of the preliminary facts, which are essential to the exercise of the jurisdiction, namely, that the property is not in use, and is not needed by the company that holds the title to it.

So that we shall not submit this question with any want of confidence as to what the result will be before you; and in that connection I can call your attention to the fact that a large number of jurors, and the State authorities, and the local authorities of this city, have already acquiesced in and approved the use of this street for the purpose of this elevated road. I shall introduce those facts in evidence, not for the purpose of controlling your judgment, because under the constitution you have a right to pass upon this question of necessity, but as bearing upon the question, as something to be considered by you. We shall prove to you that every jury that has been called, and a large number of juries have been called in these cases and have condemned property along River street, and also the property where the union depot is to be constructed, and all of those juries have been unanimous in their decisions that the public necessity requires this right of way along River street should be taken.

This necessity arises in part from the fact that the private property between River street and Fort street west in this vicinity is occupied by a large number of large manufacturing institutions, and it will be necessary, in order to lay out a route between those two streets, to go right through these manufacturing plants, and there would be another very strong objection to it, as I will show you by the testimony of the engineer, that when you come up towards Fort street the ground rises, Fort street being higher than River street, it will be necessary to cross nearly all the property at grade. There could be no overhead crossing at Sixth street,

29

or at Seventh, or Eighth, or Tenth, or Eleventh. or Twelfth, or over quite a number of those streets. You would have to cross at grade, so that you would have a railroad running into the city, with all those grade crossings, whereas, if you locate it upon River street, the situation of the ground is such that you can go overhead along River street and leave that open, and leave all the intersecting streets open; and in addition to that it has this advantage, that it does not destroy the manufacturing property that is situated along the line, but that property is left to be used for manufacturing purposes for all time. The property of the Peninsular Stove Co., one of the largest and most successful institutions in the city, is just beyond Eighth street. There is the Diamond Match Company and the Union Mills property, and a large amount of property in that vicinity, and near the railroad is the manufacturing plant in question in this case, the planing mill and box factory of A. Backus Jr. We shall introduce all these facts in evidence and submit the question to you, whether or not the public exigencies require that this property should be taken for this purpose.

As far as the public interests are concerned, we shall also prove to you that this route has been approved by the authorities of the State of Michigan and by the city of Detroit. Under the law it is necessary for the union depot company to make man or survey of its denot grounds and for the law it is necessary for the union depot company to make

a map or survey of its depot grounds and of the connecting lines of railroad by which those depot grounds are to be reached, and the grounds that are so laid out and the routes that are so laid out must be submitted to the State railroad crossing board for approval, under a provision of the general railroad law that if one railroad crosses another, the place of crossing and the manner of crossing is to be determined by the State railroad crossing board. Under this statute the Fort Street Depot Company did prepare a plan which laid out a route along River street. They submitted it to the State railroad crossing board, and that board approved it. statute also provides that before you can build a railroad along a public highway, either at surface, or at an elevation, it is necessary for the company to obtain the consent and approval of the common council of the city, or of the township board, in a case of a township, and that consent is to be granted upon such terms and conditions as may be agreed upon between the authorities on one hand and the company upon the other. Under that statute the Fort Street Union Depot Company submitted to the common council of the city of Detroit its proposal to build this elevated railroad along River street, and the common council of this city took the matter under consideration, and they agreed upon an ordinance by which the city of Detroit and the Fort Street Union Depot Company fixed the terms and conditions by which this road was to be built along this street. I refer to that for this reason, gentlemen, that as far as the public interests in that street are concerned, it is committed to the care of the common council

and to the care of the legislature of the State. The legislature of the State has the right to authorize the construction of a railroad along a highway, subject, of course, to the con-

stitutional provisions that the abutting property-owners will be entitled to such damages as they may sustain on account of the railroad being put in the street. But, as far as the public interests are concerned, it can be released by legislature. The legislature authorizes a railroad company to go along a street whenever the local authorities, speaking for the people of their locality, the local authorities being thereby vested with the discretionary power to determine whether a railroad should be built in a public highway or not. Of course, it can be readily seen that the public might want to build a railroad in a public highway where it would not be proper and it would not be a suitable location, the interest of the city and the public being considered. We could imagine such a case, but it is not the case here. We shall show you by the testimony, and by your view of the premises down there, that this property has become a railroad and a manufacturing vicinity, that whole vicinity. The land about there for many blocks is used for that purpose. The property upon the south side of this street is already devoted exclusively to railroad purposes, a very large railroad business being carried on by the Michigan Central, for the distance of three-quarters of a mile, if not a mile. The property along River street years and years ago was regarded as valuable for residence purposes. Probably many of the jurors remember when there were residences up and down the river. Where Col. Larned resides at the present time, I believe, is a residence built by Gov. Porter upon the bluff where it commanded a very fine view of the

river, and there were residences of very good quality further towards the city. But as the city has developed, as it has gone along in its progress from a very small place to a place of considerable population, there being something over two hundred thousand inhabitants here at the present time, residence property has been compelled in that vicinity to give way to business, and it has become, as I have already stated, a manufacturing and a railroad center. So that the company in their desire to come here is not invading a residence street, they are not invading a business street in the sense of a street upon which stores, retail and wholesale, are maintained.

It will be your duty, under the constitution and the law, to go and look at the property, to look at the vicinity, and to finally determine, after you have heard all the testimony in the case, and have ascertained all the facts and circumstances that go to a correct conclusion upon the subject, to reach your verdict upon that branch

of the case.

If you find that this is a matter of public utility and a public use, such as justifies the taking of this right of way under the constitution of this State, it will be necessary for you to determine the damages that are sustained by the owners, or those interested in the property known as the Backus planing mill and box factory. We shall show you that the property itself is owned in fee by Absalom Backus, Jr.; that the property is in possession, under a long lease, of a corporation known as A. Backus, Jr., & Sons. The stockholders in that corporation consist of the old gentleman him-

3 - 55

self, Absalom Backus, Jr., and his two sons, Henry N. Backus and Newton D. Backus, and they are at present carrying on a planing

mill and box factory upon this property.

As to the question of damages, we will show you on behalf of the company, that the damages in this case will be very small indeed; that is, the actual damages that this property In the first place, Mr. Backus' property is a manufacturing property, and the elements that are to be considered, and the facts that are to be considered, in determining the amount of damages which will be sustained are very few. We shall show you beyond any possible controversy, by the testimony, that there will be no increase in the fire risk. We shall show you that the way a railroad is operated at the present time, with the improved locomotives and fire-boxes, and appliances in regard to fire, is such that it is almost a physical impossibility for a fire to be set to that planing mill by the presence of an engine upon an elevated road in the street in front of the property. This superstructure, as I have said, will be fourteen feet in the clear. In front of the Backus planing mill it will be something more, so that the superstructure above that will be some five or six feet, so that the rails will be something like twenty-four or twenty-five feet above the street, and the smoke will be twelve or fifteen feet above that. We shall introduce the testimony of competent railroad men, who have had large experience upon that subject, men who have carried on the railroad business, have run engines and locomotives in the Saginaw valley, and in the vicinity of saw-mills and planing mills for years, and who say that as far as the fire risk is concerned there is no appreciable damage. As far as the obstruction of the light to the premises is concerned, we shall show you that the superstructure itself, as it will be described to you by the engineer, and as you can readily see from its dimensions, that it will not produce any effect upon the light in Mr. Backus' mill, or upon his premises. You will understand that this structure is to be fourteen feet in the clear, and that the posts are to be twenty-five feet apart

longitudinally along the curb, and that there is the entire width of the pavement, extending from curb to curb laterally, and all that will be left open. In addition to that, it will appear to you by the testimony that this whole superstructure is not solid, that it is not a superstructure that will have a roof overhead, over any portion of the street. On the contrary, in front of this property it will be so constructed as to leave a number of openings-either one or two openings-that will be about four feet wide. I think in front of a portion of the property are three tracks, and between each one of the tracks will be an opening four feet wide. The superstructure will be built in this way: The longitudinal girders, which are steel plates bolted together, will be under the railroad iron, and on top of those girders will be laid cross-ties. The width of those ties will be six or eight inches, and those ties will be nine feet long, and they will be held together longitudinally by what they call bond timber, that will run along the top of the ties upon each end with notches cut in the bottom of the bond timber, so that it fits down on the ties

and holds them in place there. Of course, the end of the ties will be open. There will be six or eight inches space between them, and between the ends of the ties and these three different tracks there will be an open space of four feet, so that on this street there will only be three tracks, nine feet each, or twenty-seven feet, occupied by this superstructure, and that will not be all solid. It will have an open space left in the roof of the structure in such a shape so that a large amount of light would go in onto the street below, so that the superstructure itself could not appreciably darken the premises or the building. There being no increase in

the fire risk, as we shall show you by the testimony of insurance 33 men, and men who have had experience in operating railroads, there being no injury of the light, the only other things to be considered are the extent to which the use of the premises would be injured. This is a planing mill, and it is in a manufacturing vicinity. It is not hotel property, it is not residence property, and the effect the noise of passing trains would have upon the premises, or upon the property for manufacturing purposes, would be very There will be some little effect from smoke and slight indeed. small cinders, but, as I say, it is already in a manufacturing vicinity, the fire risk is not increased, and the disadvantage to the property because of the passage of these trains along there would have no appreciable effect in our judgment, as we shall be able, I think, to show by the testimony, upon the transaction of business in this planing mill, or upon the prer. ises in question. These are the only things that go to show that this superstructure and the operation of the railroad upon it would have any effect upon the market value or the rental value of this adjoining property. On the contrary, gentlemen, we shall be able to show you by the testimony of the engineer, and by your own observation and judgment, that this railroad would be of very great use and very great benefit to this property. You will find that Mr. Backus has located his planing mill and box factory right alongside of the Michigan Central railroad; that he built it there long since the Michigan Central railroad was in operation, presumptively built it there for the purpose of obtaining railroad facilities and switch facilities for the transaction of business of his planing mill. But the Michigan Central may have been the only railroad connection that was de-

sirable years ago, but it is not the only railroad connection that is desirable now; and we shall show to you that it is perfectly practicable, in fact, it will be an advantage, to put a side track upon an elevation between this superstructure, along this line of lots, so as to furnish side-track facilities upon this elevation right alongside this property if need be, so that he can run cars in upon his property, so that he can load the products of his mill there, if he desired to. In that way his railroad facilities there for this business, or some other business that eventually will be carried on there, will be very greatly facilitated by the presence of this railroad in that street and in that locality. At the first blush, any one might suppose that a side track at an elevation would be undesirable, but it would have this advantage, that the street would be open below,

so that traffic could go right along under the superstructure, and as far as loading or unloading upon an elevated side track, it depends entirely upon how you arrange your building. It is just as easy to load on one floor as it is upon another, and in fact, it will appear, when you come to go through Mr. Backus' mill, that it would be wholly a matter of indifference on which floor he did load, as he takes his lumber by machinery to the top story, and distributes it on the different floors, and can load from one place as well as from another, and as a matter of fact, does load out of the second story a good share of his products. So that when you come to look this property all over, finding out what it is worth, finding out the use to which it can be put and has been put, and we will show to you the value of the property, we will show that the property is not worth to exceed one hundred or one hundred and fifty dollars a front foot upon River street, and we shall also show you what his planing

35 mill and buildings and machinery there are worth, so that all the conditions that are necessary for a correct conclusion will be laid before you, and in addition to that, as I have already stated, you will have an opportunity to go through and look all over the property. The theory of the constitution and the law explained by the Supreme Court, is that where a jury takes a view of the premises, they are to go upon their own judgment quite as much as they are to act upon the judgment of the witnesses who may be called before them. Being men summoned from the vicinity, and more or less familiar with real-estate values, more or less familiar with business, more or less familiar with what can be done with property, it is to be supposed that your judgment will be quite as good in most instances as that of any witness who might be offered before you upon the subject. At any rate, we will give you the testimony, and you will have this view of the property, and it will be necessary for you to determine, in the first place, whether there is any public necessity for taking this right of way along this street, and in addition to that, if you find it is necessary, you will determine the damages to be paid to the respondents and owners of this particular abutting property.

As I say, this is one of the last of the cases. As soon as this is disposed of, the work at that point can be proceeded with. have nearly reached it at the present time, and we shall go along as rapidly as possible, and submit it to you with the expectation and the hope that you will readily come to an agreement in regard to the question of necessity and the question of damages they will be entitled to. With these remarks I shall proceed to put in the testimony before you.

Mr. Dickinson: It is of the utmost importance, gentlemen 36 of the jury, in approaching the consideration of a case of this kind, that what we call a jury, impaneled under the constitution of this State, should thoroughly understand their peculiar duties. It has probably occurred to you, when Brother Baker has stated that the State railroad crossing board has approved the route, that the common council have permitted the use of the street, that the Michigan Central had submitted to condemnation and use

of the street, it has probably occurred to you that there must be some great reason here, after all these things have been done, why you should be summoned to pass upon the question of whether a proper route has been selected. That is your great duty, in the view of these respondents who are summoned into court, and in view of their counsel, there should be no question under the law of this State, and under the duty which is imposed upon you by the constitution of your State, to go into the question of damages at all. Backus & Sons, with their great plant, one of the largest of the kind in the United States, which has been the work of a lifetime on the part of Absalom Backus, Jr., the work of forty years, building it up and maintaining it, a great industry here in the city of Detroit, they ask not one penny from this company for coming They do not want a dollar of damages, rememto the union depot. When this jury shall have done what we may concede ber that. to be its duty, which is reposed and imposed upon it as a distinct governmental agent, as much a governmental agent as the governor of the State, of as independent powers as the legislature of the State, when this jury shall have done its duty as a governmental agent, and sent this union depot company over the proper route to its union depot.

It is not true that the question of this route has been fairly The union depot, on the corner of Third and Fort 37 streets, is a matter that all itizens want, Backus in common It is conceded that the union depot, on the corner of Third and Fort streets, is a public convenience which should be established. There is not a word to be said in behalf of these respondents against the establishment of that depot. There is not a word to be said against that enterprise, not one. But this is to be said, that before they shall appropriate this street and our property. they shall satisfy a jury that it is the proper route; that in taking it, the greatest consideration and the proper consideration has been shown to the public, and proper consideration to the great enterprises and interests involved along the line of this street. do not beg this of you, but, under your oaths, you have got to pass upon the great question of whether this is the proper route, considering the interests involved, the interests of the company and rights of the public, as well as the interests of Backus, who believes, and the testimony, I think, will show, that he has fair grounds for his belief, that the running of three great tracks, over which will run four great trunk lines of road, by his business, within nine feet of a part of his structure, and within forty feet of the balance of his structure, will utterly ruin his great business.

Now, let us see. Under the constitution of the State, prior to 1850, the legislature of the State of Michigan authorized a railroad company to take private property. Under the constitution of 1850 that worked so poorly, because railroad companies could influence legislatures to the injury of the people at large, to the injury of

private property, the legislatures could confer the right to take private property, or take a street in which the abutting owner has private property, it was subject to so great an abuse under

the constitution of the State of Michigan prior to 1850, because a lobby could go there and get almost anything through the legislature, it was subject to so great an abuse when the right was conferred upon the common council to give the use of the street and the right of property in streets, that there was inserted in the last constitution adopted, in correction of this abuse, in correction of an abuse that had reached a state where the people could not endure it, this coming upon them of private interests, railroad corporations, because after all they are private corporations, nothing public except the right to take a man's private property if he stands in the way of it-so great was the abuse of the influence brought to bear upon bodies that were sent to Lansing to take property in the interests of private investments, like this, that there was inserted, by the unanimous vote of the constitutional convention, and adopted by the people of this State, this provision, that no railroad should proceed across a street, or along a street, or across private property of any citizen, even if the legislature of the State by an act signed by the governor of the State should authorize it, even if the common council should authorize it, should not proceed and touch that private interest until a jury of twelve freeholders of the vicinity, neighbors of the man whose property interests were invaded, citizens of the State where public interests were taxed, should say that that route was absolutely necessary. So that, gentlemen, you are by the constitution of your State, under which governors are created, under which legislators are created, under which councils are created, under which all governmental agents

are appointed, by the constitution of your State, which has 39 for its first duty, its first purpose, the conservation of private property, the protection of private interests, the private liberty and the right to hold property against your neighbor, against any combination of capital, over and above governors, over and above legislators, over and above railroad boards, appointed by the legislature and the governor of the State, over and above common councils as the chief governmental agent, from whom there is no appeal over and above the court, you have no judge to direct you; the judge cannot direct you as to your duty, he cannot speak to you, except as you ask him for advice, and then you are not bound by it. You are sitting upon this question, and when it comes to the question of the disposition of the private rights of citizens, you are set over and above courts and governors and legislatures and common councils, and all other constituted authority, and before a route can be taken you must say, even after the engineers have laid out the route, even after common councils have authorized the route, even after legislatures have authorized the route, even after crossing boards have authorized the route, it is all subject, first, last and always, to the decision that you shall give, whether this route is the one which is necessary to be taken, as compared with other route, as the route by which the railroad entrance to the union depot must be taken, as a necessary one, and as the route which will do the least injury to your fellow-citizens. This is your duty. why it should be said here, in view of the constitution and of the act

of the legislature—the legislature did not constitute you. You do not owe your existence here to a legislature. You do not owe your existence to having been drawn from a list made by a jury com-

You do not come forth out of the jury commissionmission. ers' box. You are not created by the legislature of the State. 40 You owe your existence to the fundamental law, the constitution of the State, not by legislators, but by the people, the source of sovereign power. You are taken directly from the hands of the people, by that fundamental instrument, the organic law by which we are a State. By that you hold your office. I appreciate it, gentlemen, appreciate it, and the reason for it, because legislators could not be trusted to do their duty, because common councils could not be trusted to do their duty, because railroad commissioners could not be trusted to do their duty, you, coming fresh from the body of the people, who adopted your constitution, are chosen to do your own duty, under your oaths to take the responsibility, and from

your decision there is no appeal.

I have thus endeavored to present to you, with such poor language as I can command, the dignity of the place which you occupy, and to present to you the responsibility and show you that the adoption of a route by a railroad company, the selection of a route by a combination with the Michigan Central, and its approval by the Michigan Central, the selection of a route by the constituted authorities of the State, can cut no figure here, because as they cross here is the first place, as they cross from the old union depot grounds, the first place they enter by the route they selected, as they enter upon it, as they propose to enter upon it, the first place is the Backus property. Hundreds of jurors he has said have passed upon this question. Jurors have passed upon this question of the condemnation of property for the union depot, it is true, but let me say because the union depot has been established on the corner of Third and Fort streets, it is no reason why this route should be adopted. Let me illustrate by as strong an

illustration as I can take. Because the union depot is estab-41 lished on the corner of Fort and Third streets, and because the State crossing board and the common council and the legislature should authorize an approach to that union depot down Woodward avenue and down Fort street, have you got to vote for it? That is as strong an illustration as I can take. It does not follow because a union depot is established, that you have got, you, the constituted authorities of the State, the representatives of the people of the State, under the constitution, that you must bow to it and say, Mr. Union Depot, you have got your union depot, you may select your route down this populous street, Woodward avenue, and we have got to pass it. You are called upon to say whether they have adopted the proper route, with due consideration to abutting owners. Who would approve it for one moment? If they had already approved it, if they got a common council to approve it, if the engineer had laid it out, if the crossing board had laid it out, if the legislature had approved it, is the city to permit the railroad company to put their tracks down Woodward avenue? Not much. And they cannot build it until they have passed this tribunal of twelve men, and they cannot build this road up River street and take possession of this street, and take our property in River street, until they have passed this tribunal of twelve. The engineer lays out his route on paper, subject to the decision of this jury of twelve. The crossing board adopts the plan of the engineer, and say that, as far as the State is concerned, we approve the structure as you have placed it, but you have got to submit the route to the jury of twelve. The

common council approve of the plan, provided that they get the approval of this jury of twelve. They cannot enter River street, and this is the entrance, this is the channel through which they seek to pass. This Backus place is where they enter River street. They know that with the common council proceedings and the legislation and the action of the crossing board nothing can be done as to the structure which they propose to build; everything is upon the express condition always that they satisfy you that this route is necessary in their approach to the union depot. Suppose they had established the route down Woodward avenue, and they had come before you and said that it was the action of the union depot company in laying out their route to give this the preference, and that they had got the approval of the authorities, and attempted to urge upon you that they had done all this, and should say to you: Do not turn us back on another route, whereas they should have laid out their route and submit it. They should have said: This is the route we would like; this is the route for which we have obtained permission of the State authorities. They should call the jury and submit this route, and if it does not satisfy the sole tribunal that can pass upon this route, these twelve men, we will take the other.

I do not propose to read you a long decision, but I do propose to do my duty in this matter. My duty as counsel, and it is a sworn duty like yours, is to show you what I can by extracts from the opinions of such judges as Campbell, whom you all respect and revere, and Cooley, a man of national and world-wide reputation, that this railroad cannot select its route, and it does not bind any one if it marks on paper what route it wants to take, and that your

duty is to cast aside every wish or every interest of those interested in the matter, and find that it is necessary to take this route, that it will do the least harm to take this route,

and that none can be taken that will do less.

What is this power of eminent domain? This is not a public corporation. The right of eminent domain originated, as you all know,—you know if there is anything sacred to a man, it is the right to hold his home and his property. No one can touch it. It is what he pays taxes for, to be protected, first in his life, second in his liberty, and third, in his property. That is why you organize State governments, why you organize county governments, why you organize city governments, for the simple protection of life, liberty and property. Private property cannot be taken, except for public use. For public use they may come and take your property if the jury find it is necessary—for a court-house, a school-

house, or a public street. As railroads were built they were not considered public agents. They are private corporations, but as a necessity, when railroads came to be built, if they came to a man's farm and it was necessary to lay the road out in a direct line, and he said I will not sell to you, under the constitution there was handed over to these private corporations to condemn a man's land when he would not sell it at any price, handed over the same right of eminent domain that is exercised for condemning land for a public street, and that is all there is of it. At the same time, bear in mind, it is provided, as a guard, a check against private enterprises of this kind, that they shall not take it nor use it except on a vote of twelve freeholders and neighbors of the parties in interest.

Let me refer for a moment, not for long reading but for brief extracts upon the law, as you will have no court to charge you, and as you are the judges of the law and the facts, so that no one can

influence this jury of twelve freeholders.

Judge Campbell says, in the case of People vs. Salem, 20

Mich., 496:

44

"Unless railroad companies can be regarded as in some way representing the public, then they cannot stand before the law on any other footing than private citizens. So far as their business is concerned, they furnish on a large scale and in a more perfect way the same benefits which are extended to the population by other carriers, by land or by water, and benefits quite similar in principle to those conferred by enterprising hotel-keepers, millers and others who find it to their benefit to entertain all applicants impartially. They benefit the municipal corporation or the State in their corporate capacities in no way whatever beyond paving their taxes, for which they are presumed in law to get a full equivalent. They benefit the neighborhood, large or small, in the same way that all other business and enterprise aid it, by increasing population and stimulating commerce and industry. They do on a large scale what every industrious settler does on a small scale, and they do it just as every private person is supposed to conduct his affairs, primarily for his own benefit, and incidentally for any advantages that may follow or attend their private success to the benefit of others. There is nothing in the nature of their business which distinguishes them from any other persons, so as to make it in any legal sense a public undertaking. It is said, however, that by the exercise of the right of eminent domain they are affected with a public character, and become invested with public functions. If the exercise of this power is never valid, except on behalf of some public agency, then it might follow that it could not be used on behalf of these companies. It is reasoning in

the wrong direction to determine the character of the
beneficiary from the fact of its use. But it has been customary from time immemorial to allow lands to be taken
for turnpikes and canals in the hands of private corporations, because the land could not otherwise, as a general thing, be obtained
for the whole line. The fact that the work was one of general utility, and that no work of that description was possible without the

exercise of this power, has created precedents which were readily applied to railroads. They were always found on necessity, and were the extreme application of a power which in a much smaller degree has frequently compelled private owners of property to submit to some obligations whereby their neighbors might be enabled the more securely and conveniently to use theirs. In some cities of England, by ancient custom, there were regulations concerning party walls, drains and the like, which rested on similar principles, and in some cases, modern legislation has followed the same rule. The courts, when railroads were first invented, recognizing the necessity and endeavoring to find some plausible basis for it, carelessly said that the railroads must be regarded as agents of the State, and in this apparently simple way solved the difficulty. But it was a mere figure of speech and made them no more State agents than the decision that many things are lawful because devised by the Government as necessary to carry out some governmental power makes every one who avails himself of the privileges of the law a Government agent. Such a theory would make agents of preemptioners and national bankers and ocean captains, all of whom receive certain powers and privileges in order to further the policy of the United States."

As to the duty of the jury, I refer also to the opinion of Judge Campbell, and I call your marked attention to this in connection with this opening by Brother Baker, that because the railroad has located the route you have got to give it. I read from one of the last decisions of that distinguished judge, who for so many years defended the rights of the people, asserted and

made luminous the fundamental law bearing upon the rights of liberty and life and property from that bench.

I refer to the case of The Grand Rapids & Indiana Railroad Com-

pany vs. Weiden, 70 Mich., 393:

"It seems to be imagined that railroad companies are to be presumed entitled to proceed to condemn lands at their own option, and that nothing more than a formal effort is required to give them the right to do so. But under our constitution this is not a correct view of the subject. Under the old constitution, when the legislature chartered a railroad the right to build it became fixed, and could not be questioned, and, consequently, land-owners were obliged to acquiesce. But, under our present constitution, there is never any presumption that a railroad is necessary, or that any particular land ought to be given up to its uses. Every land-owner, therefore, has a perfect right to object to giving up his land, and is not confined to objections depending upon price or value. He may object to the lack of necessity for the road at all, or for its location, or extension over his land, at any price or on any conditions. law, his use is presumptively as important as that of a railway company, and it must devolve on any such company to establish affirmatively that all is needful to make out a clear case of necessity. And a road already established has no better claim than any other to extend or change its lines. Although railroads are allowed by

public policy to condemn land, because they cannot exist otherwise, nevertheless the enterprise is, under our laws, which prohibit public ownership of railways, one of private interest and emolument, and must show its claims to legal assistance."

In the case of Ryerson vs. Brown, 35 Mich., p. 341, Judge Cooley,

concurred in by Judge Campbell, says:

"If in individual instances (in the fixing of the route) obstacles are encountered in the unreasonable objections of individual land-owners, the rare instance cannot justify a general law which would be likely to breed as many grievances as it would cure, for legislation of this sort is always grievous when no great necessity justifies it; and it is always an invasion of liberty and of right when one is compelled to part with his possessions on grounds which are only colorable. A person may be very unreasonable in insisting on retaining his lands (we shall show you that Backus is not unreasonable, but that he is quite reasonable), but half the value of free institutions consists in the fact that they protect every man in doing what he shall choose, without the liability to be called to account for his reasons or motives, so long as he is doing only that which he has a right to do."

I am careful thus to give you just the highest authorities upon these questions, especially as there is danger of confusing the rights of citizens. You can see that this great fundamental right of property is here involved, and that is why I take the time to impress your minds with the high duty under the law. I do not merely make my own statement of it, but in connection with my assertion

of it, I give you the highest authority in the land.

Upon the question of the necessity in taking land for public uses, in the case of Powers' appeal, 29 Mich., p. 509, Judge Campbell

uses this language:

48 "The determination of this necessity has sometimes been allowed to be made by legislative or public agencies. But our constitution has taken away this power from all bodies except those indicated, and in cases like the present, the fact of necessity must be found by the jury. The common council (that was a streetopening case) instead of acting judicially or finally on the policy of opening a street over private property, which they cannot obtain without adverse proceedings, become no more than petitioners, and the decision rests with the jury and not with the city. (And not with the common council.) Where the constitution is so imperative, no legislation can be maintained which does not plainly require that question to be left to the jury. Their finding, without such a requirement, is not within their oaths, and is extra-judicial. The oath is the measure and limit of their legal action. And it is impossible to say that property has been taken by due process of law unless the statutes provide expressly for every constitutional safeguard framed to govern such action. Cases have frequently arisen where the verdicts of juries have shown that they have had no such rule before them. There is very serious doubt whether the repeated provisions leaving it to the jury to determine the necessity for using the property intended to be taken for such improvement, do not most naturally convey the idea that they are not to pass upon the necessity of the improvement itself. Their oath is not specific, but merely swears them generally to discharge the duties imposed upon them by this title, and is not in any way calculated to help them in ascertaining their duties."

And then he passes upon the question of the legislature as to street openings not requiring the necessity of passing with authority on that route for the public improvement, and it was invalid be-

cause it was not so decided.

49 Let us see what Judge Cooley, concurred in by Judge Campbell, says in the case of Grand Rapids vs. Grand Rapids &

Indiana Railroad Company, 58 Mich., 645-'6:

"The claim is raised that the jury were not required to find the necessity for the opening of the street, but only the necessity for taking the land in question for the street declared necessary by the council. This is a practical difficulty which has caused much It has often happened that juries have been led or allowed to evade their own responsibility in passing on the necessity for the work itself. That is, as we have frequently pointed out, their most essential duties, because, if it is taken for granted the road is to be laid out (and Mr. Baker says it is to be, because the engineer has laid it out on paper and the common council has approved it, and the board of crossing commissioners have approved it), the position of the particular parcels on the line is fixed when the road is fixed. The object of the constitution is to prevent all needless appropriations of private property, which are too often made for ends in which the public are in no strait, and for private fancy or emolument rather than the general wellfare."

I have only given you, gentlemen of the jury, extracts from the leading cases, and I now give you a statement as to the strict rule to be applied in these cases, from Judge Cooley, at present one of the Interstate Commerce Commissioners, and whose fame as a constitutional writer and as a writer upon the rights of the people is as wide as the Anglo-Saxon speech; Cooley is read in the highest courts of England, wherever the English language is spoken, as

high an authority as was ever penned upon the rights of the 50 people at large. I read from his book on Constitutional Limitations, which is the standard authority upon fundamental rights, 4th edition, marginal paging 530, upon the power under this

right of eminent domain to take private property:

The powers granted by such statutes are not to be enlarged by intendment, especially where they are being exercised by a corporation by way of appropriation of land for its corporate purposes. There is no rule more familiar or better settled than this, 'that grants of corporate power being in derogation of common right are to be strictly construed; and this is especially the case where the power claimed is a delegation of the right of eminent domain, one of the highest powers of sovereignty pertaining to the State itself, and interfering most seriously, and often vexatiously, with the ordinary rights of property.' It has accordingly been held, that

where a railroad company was authorized by law to enter upon any land to survey, lay down and construct its road, to locate and construct branch roads, etc., to appropriate land for necessary side tracks, and a right of way over adjacent lands sufficient to enable such company to construct and repair its road, and the company had located and was engaged in the construction of its main road along the north side of a town, it was not authorized under this grant of power to appropriate a temporary right of way for a term of years along the south side of the town, to be used as a substitute for the main track whilst the latter was in process of construction."

I read this, and have read from these decisions, to show you how sacredly the rights of the people are held in this matter as against the corporations to whom has been delegated this great power of eminent domain, and to show how strictly this power must be con-

strued.

Now, for its application, gentlemen of the jury. I say to 51 you that there is no necessity whatever for this elevated structure to come up River street. I say to you that I shall show you beyond a shadow of a doubt, by the statutes of the State, a provision in the statutes of the State, and in an act passed at the time of this union depot legislation, providing that this union depot must confine its routes to approach its union depot along the line of railroad property already acquired within the city limits. Brother Baker says, "We have already had condemnations; we have got our route from the Michigan Central." The Michigan Central, of course, they have got 2,000 feet; they paid the Michigan Central \$29,000 for using River street along the margin of their track, of their property. They condemn the right of way of the Michigan Central, and in the suit of the Michigan Central, before three commissioners, they let the commissioners find that it was necessary to come up River street. That is one of the precedents they establish. He says they have condemned most of the wav up there; that is the Michigan Central crossing. They have not had any suits of any account except with the Union mills. They have not had any with the Peninsular Stove Company or with the other large companies there, but what they have condemned is to go along the line of property of the Michigan Central. They own to the middle of the street; a property-owner abutting on the street owns to the middle of the street, subject to the public easement. They say they have condemned all this, and you must give them this, although we are just entering here; this is the threshold, and the jury must pass upon the threshold; you must give us this entrance on the threshold because we have condemned the Michigan

on the threshold because we have condemned the Michigan Central. Of course, the Michigan Central did not want to give a lease of its ground, did it? Of course, it would permit the finding of necessity along River street, so that it would not find the necessity to use the Michigan Central ground. Is that going to be a precedent for this jury, that a railroad, owning 38 acres of ground in the city of Detroit, and the best business property in it, has preferred that the union depot, in approaching its own

54

property, should take one of the city streets, instead of taking Michigan Central ground. Of course, they would say so, if they got pay,

\$29,000, and have their ground intact.

Now, let us see, gentlemen of the jury. I tell you that this union depot company, if it does not make its agreements with the Michigan Central not to do it, and does not come into court with it, they can come upon the margin of the Michigan Central property on the south side of River street, and leave Backus' property untouched, without paying Backus a dollar. The Michigan Central do not want them to; they say, use River street and leave us alone. Why don't they condemn Michigan Central property instead of condemning our property in the street and imperiling our business? They say they won't do us any damage. We say they will. We say they will ruin our business. We say "You will ruin our business; if you think you will not, if you don't want to pay us, and we don't want a dollar of your money, this business that we have built up is worth more than all you can pay us—it is the business of this man's life, he has just settled it so that his boys can run it, and he can have some rest, after he has accumulated this property—if you don't want to pay us, and we don't want your money, go over there and condemn Michigan Central property, con-

demn your line along the Michigan Central ground 25 or 30 feet up River street, and don't pay us a dollar, leave us our street free." And I tell you, gentlemen, to say that you can-

not condemn Michigan Central property is the merest sophistry. I will show you the statute which says you may take the property if it is not needed by the other road. But how shall the question of the need of the other road or company be passed upon? Precisely as these 12 men are passing upon this question. It goes before a jury of 12 for condemnation. The Michigan Central will say to the union depot company, "It is not necessary to take our route," just as we say it is not necessary to take this. They will say to the union depot company, "We need all our property." "Very well," says the union depot company, "you need all your property; we will try that question before a jury of 12 men in the city of Detroit, whether you need 38 acres of ground of the best business property, on River street, to carry on your business." It is of the most vast importance to Detroit that it should be understood that the Michigan Central has 38 acres of ground there, near the business center, valuable for manufacturing and all business purposes, on the river front, extending from Third to Twelfth-and-one-half street-91 great squares of property, all the property between River street and the channel bank, and between Third and Twelfth-and-one-half street, are Michigan Central property. Below that is this great railroad holding forty acres: that makes 78 acres; here is the Grand Trunk and the Detroit & Milwaukee, with 36 acres, making 105 acres, right here in the city limits, mostly of our best and choicest and most valuable business property. Aye, more, and it has not paid and does not pay a dollar of taxes. Are you going to give them some more? In addition to giving them your best business prop-

erty, are you going to give up your public streets? Are you,

at the expense of other business enterprises, going to give these railroads your public streets, and drive out good business enterprises that have been established here by a lifetime of work? Weigh it carefully, gentlemen of the jury; consider how much property is occupied by the Grand Central depot in New York, and compare it with what is held here. How many trains do you think come in these three depots with 105 acres of ground, in the business centers? One hundred and five trains daily in and out-68 on the Michigan Central, the rest between the Wabash and the Michigan Central depot, including the trains that come in on the Flint & Perc Marquette, the Detroit, Lansing & Northern, and everything that comes into the depot, and everything that comes into the D. & M. and Lake Shore, and everything. Do you know what is occupied of the business property in New York for the great Grand Central, into which come 245 trains daily? It occupies but 61 acres of this high-priced property. Do you know how much the great union depot of St. Louis, which accommodates all the great trunk lines of the country that go east and west, with 244 trains daily, occupies in the business centre? Ten acres. Council Bluffs, with the great number of trains coming there, in that great trading place, occupies 51 acres. St. Paul, with a large area of new property, in a new town, occupies 11 acres, with all the railroads going to St. Paul. Indianapolis occupies less than 8 acres, with every train that goes to Indianapolis going to that depot. The passenger depot in Chicago occupies no more than 7 acres. Of course the railroad business takes more acreage, but not in the valuable business portions of the city. Why? Because they cannot afford in Chicago, where they are taxed, and in Missouri, where they are taxed, and in any other such place 55 where they are taxed, in Indianapolis, where they are taxed, in New York, where they are taxed, they cannot afford to do their freight business on the choicest business property. Choice business property, when it is taxed on its valuation, must give way, and the railroads must retire where they can get cheaper property for freight business. In every other city in the land the railroads are compelled to do that business in the suburbs, where it can just as well be done. There is no city in the land, nor in the world, which permits its freight business to be done in its business or near its business center, upon valuable real estate, except Detroit. It does its passenger business in business centers, and it holds an area on which it can do all its passenger business with great convenience, and does its freight business where it belongs, except the mere package business, which can be done in the business centers conveniently without much space. There is no doubt about this, and you can go down to the Michigan Central road and see how they do their freight business in the central part of the city. You must remember that the Detroit, Lansing & Northern and the Flint & Pere Marquette roads are going out of the Michigan Central, with its 38 acres, and are going to use the union depot with its 5 acres. You will find that on the Michigan Central they are storing all their freight cars on this 38 acres, in the business portion of the city, and

we are permitting it, and exempting it from taxation. They say they use it all. They may use it for freight, to store freight cars, or whatever you please; but they cannot stop the union depot from approaching their union depot over the Michigan Central road, ex-

cept by showing a jury of twelve men, when the union depot 56 seeks to acquire that route up the margin of its road, south of the River road, that it is necessary; they will say that they need it; they will say they need 38 acres, when they cannot show that any road in the world occupies in any city of the world, to exceed 12 acres for ten times the business. You see, there is something in the position that his learned friend, Mr. Dickinson, takes as to the use of this River road, when there is abundance of railroad property to confine the railroads to. How are you going to get rid of this holding of the Michigan Central, if it is too much? You cannot appropriate it, you cannot tax it. An old legislature gave them a special charter, exempting them from taxation. policy of Chicago, which is the best illustration of great prosperity, founded upon a right basis, taxed every manufacturer that came into Chicago for every dollar of property that he bought there for the prosperity of Chicago. Illinois allowed Chicago to tax every dollar of railroad property that entered Chicago for the general good of Chicago. Every man who bought a dollar's worth of real estate in Chicago contributed his tax for the general prosperity of Chicago. Every manufacturer of boots and shoes, clothing or tallow, or whatever investment went into Chicago, pays its tax for the general prosperity of Chicago. Every railroad there pays its tax for the general prosperity of Chicago. Detroit, on the contrary, voted its great area on the river front to railroads, and exempted them from taxation forever. How are you going to get rid of it? Why, here is your statute which provided, the legislature having taken thought at last, that if any railroad company shall refuse to give terminal facilities to another, that other may take it under proceedings laid down in the statute. If any railroad company does not need any part of its property, it may be taken for the approach of any union

57 depot railroad company, or any other railroad that desires to enter. Now, we will say that you, gentlemen, not in this case, but we will say you were a jury called in a case of the union depot company against the Michigan Central, and the Michigan Central say, "I cannot let you go up this margin of mine up the River road; I cannot let you build your elevated road up this margin beyond 30 or 40 feet there." Why? "Because I need it." The union depot company replies, "We will go to a jury upon the question of whether you need 38 acres of land, when you bought nearly half of Grosse Isle down here just to keep your money invested, when you bought land all over here around the suburbs; we will just go to a jury and see if you need 38 acres of that land on the river front; we will go to a jury and show that jury that no other railroad on earth has such a holding of property near a business center, and does not need such a holding of property, and never has to exceed 10 acres; and how long do you think it would take us, on a presentation of facts, to get a verdict of the jury that the

Michigan Central shall play dog in the manger no more, but shall give this land at a fair price to the union depot company? We want no more combinations of railroads to keep the property they have and to take more. We will not surrender our city streets." I stand here to protest, in behalf of Backus, and in behalf of Detroit, that no more public property shall be given to railroads so long as they have ten times the area that they need. Confine them to the area they have got. Nay, more. I stand to protest that no property-owner, no enterprise, be injured. No man shall be put out of court and say that his business is ruined because Detroit, with her

235,000 inhabitants, has given more of her property and of the public streets that runs by these manufacturers, to railroads, which already have ten times the area that railroads

in other cities in the land have.

Now, I ask you to discharge your minds of any condemnation by other juries or other commissioners of the Michigan Central property, and any finding of necessity, on the part of anybody else, common council, or whoever it may be, juries or whatever it may be, when here is the crucial test: Will you at the threshold-and Backus stands at the threshold-find for the city as well as for his parcel? Here at the threshold is the test you must make; here is where you sought it at the other trial; here at the threshold we tell you to stop and to go to this Michigan Central property. You see what they are going to build by us there. They are going to build that roadway with three tracks. They say it will be light. light will they be with these trains passing over, with the ties that they put across there, 8 x 9,6 inches in the spaces, with three tracks, thundering by there, not with light engines like the elevated roads in New York, of 700 or 800 tons, but of 2,000 tons, driving their heavy passenger trains; and they are going to run a freight depot up here on 21 acres devoted to a freight depot, on the new union depot grounds at the corner of Third and Fort streets. They are not only going to trundle with one great trunk line on that trestlework, covering the whole body of the road, but they have three tracks there on which will go the Wabash, the Canadian Pacific, the Flint & Pere Marquette and the Detroit, Lansing & Northern, with all their business, three tracks, with four roads, day in and day out, Sundays included, over this structure, covering the street, within nine feet of Backus' dust-room, in front of the building that he has arranged to carry on his business, a building that is arranged as to the Michigan Cen-

tral tracks, with fireproof sides on that side, arranged to do business by the Michigan Central road, but not contemplated in any way in any of its internal arrangements to do business with reference to an elevated road running by its second-story window, running by with a track level with the second-story window, and with the smoke of the engine as much higher as the smokestack of the engine is near to the top, sweeping down with cinders and smoke, coming in at the windows, endangering his dust-room from fire, cinders, smoke, and so on. This goes to the third-story window here, and they may say it will be a great benefit to us to switch in

at the third story. How is he going to give us a switch? They have three tracks; they have got to have room for the three places. Will they show us how we can turn a switch within the space of Backus' front. It will have to have cars with elbows, to make a short turn. They have not the property beyond Backus; they have only the use of the street; they do not condemn property above or below Backus, so that they will have to find a place on his front to They will have to have cars with elbows, won't turn in and out. they, gentlemen of the jury? We shall urge upon you with confidence, that your duty will not be done to Detroit or to your fellowcitizens, the duty which you are expected to perform under the constitution of your State, as explained and fully illustrated by the highest court of your State, if you permit this route to come up there, when we shall show you, by such men as Mr. John B. Mulliken, that the best route for the union depot company itself is up this Michigan Central property.

It will appear to you in this connection that the stove works and the Union mills and all those manufacturers up there have side tracks that connect with the Michigan Central and other roads ranning up that side of the street and manufacturers.

roads running up that side of the street and up close to the buildings, and they take upon such side tracks, engines with smokestacks of the tallest kind and cars of the largest description, and the heaviest freight cars, and load them with stoves or wheat or flour, or whatever they have to ship, and run them out on the side track. Now, this elevated road is run over that, and they will show that this elevated structure is to be built so high, 14 feet in the clear and 18 feet in some places, that it will not in any way obstruct that broad-gauge side track that runs in front of those manufacturers. If it will not obstruct that for large manufacturers, if they do so construct it that it will not, how much does it interfere with the track of the Michigan Central then? If they can build their elevated structure so as not to interfere with the side track, which does an immense amount of business in the shipment of stoves and flour and other goods along River street, cannot they build it over on the Michigan Central side so that it will not interfere with the business of the Michigan Central on any track that the Michigan Central When you come to look at it you will find along went to use there. the margin of the Michigan Central there some of the oldest tumbledown buildings that you ever set your eyes on, and it would be a blessing to the Michigan Central to have this structure put up there.

In addition to giving the Michigan Central \$29,000 for their interest in the street, it is agreed that the Michigan Central shall give—they don't get anything, they give 25 feet of their entire margin for the building of a viaduct for teams, which shall run along the side of the Michigan Central property. For instance, there is

the elevated structure (illustrating with law books) running along River street. Here is the Michigan Central property and here is the Backus property. On this side, on the Michigan Central side of the structure, they have arranged to build along the Michigan Central a viaduct for teams, so that teams can reach the Michigan Central property all right without going under the

superstructure of the elevated road. In other words, the Michigan Central will have a structure for teams along this whole margin, on which their teams can enter. The Michigan Central pay half and these people pay half. But the Michigan Central does not pay a dollar; that is no part of the combination.

Mr. BAKER: What is that?

Mr. Dickinson: The viaduct for teams; no part of the money was paid for that. They build this from the curb, it is about 25 feet of the Michigan Central ground; afterwards they have clear to the river. Here is the structure along River street, here is the Backus property, and the property of these manufacturers, and over here is a viaduet running alongside the elevated road, and you can enter it from Twelfth street down here where the elevated road enters River street, you can enter with teams on the viaduct and go alongside of the whole Michigan Central property in front of Backus and for a long way above Backus. It is a part of this improvement, and will have to be shown to you as a part of this structure. The Michigan Central of course can conduct its business on the street, but what will we do with our immense business, especially with our immense local freight; we have this entrance upon River street; we have an immense local trade, and we sell not merely boxes, but we sell to this local trade, for teams to carry away, and for

which we bring the raw material to the extent of 20,000,000 62 a year, which we work up in that mill; we bring our raw material along this street which is to be covered, we sell there at our front door and deliver, asi le from our shipments abroad by the side tracks given us; we want no more side tracks from the union depot company or any one else; we have all the capacity we want, of side tracks; we have adjusted our mills as we want them, but we have a large local custom in which we sell not merely boxes, but flooring, ceiling, and wainscoting of the finest quality, both of hard and soft wood, siding and beveled woods, German woods and lath, moldings, basings and casings and house finishings, matching, deckings for ships, car sidings, roof lining, and material for boxes, slats and brush backs, stocks for shingles, screen doors and windows, all kinds of panel stock, pattern and finishing lumber, and of all thicknesses and widths, box chutes, water tanks, dressed backing, sign boards, etc., in all kinds of woods as desired; and we have the largest assortment, probably, of fine material, of the most expert quality, and the largest number of patented articles for the making of this fine work of any place in the Northwest, and we have been a lifetime building it up. Now to say that the New York elevated road bears any comparison to this is to say what strikes any man who has been in New York as a downright absurdity; but we shall show you that even in New York, with that light structure and a little box engine, carrying light cars and burning hard coal, the streets have been ruined for the purposes for which they have been used, in all clean businesses and for residential purposes; rents have been cut down from one-half to a quarter everywhere in New York where these elevated roads come, and business in which there

is danger from fire cannot be carried on; it is the story in New York, even in streets wider than this, that the elevated road has been practically a ruin to real-estate holdings, and the railroad company has been held to account for this obstruction and injury from smoke, cinders, noise and fire.

I think, gentlemen of the jury, that if I have impressed you at all with the distinction between the ordinary jury duties and your high functions as a distinct tribunal under the constitution of your

State, I have not wasted my time.

Documentary Proof.

Mr. BAKER: I will put in some record evidence. I first offer in evidence the articles of association of the Fort Street Union Depot Company. They were filed in the office of the secretary of state in Lansing on the 24th day of August, 1889. The capital stock of the company is placed at \$1,000,000, and the corporation is organized under the union depot act for the purpose of acquiring the necessary station grounds and constructing and maintaining railway, freight and passenger depots in the city of Detroit, in the county of Wayne, in this State, with the necessary railroad tracks and other conditions; to make suitable and proper connections with all railroads terminating in or passing through said city; to make desired access to such depots, and also all necessary buildings for the convenience and accommodation of all business usually appertaining to such depots. The first of board of directors are named as of Ossian D. Ashley, Randall G. Butler, a resident of Detroit; William W. Crapo, George Capell, and William L. Webber, a resident of East Saginaw, and the articles locate the union depot

grounds upon the two blocks and a half of land at the corner 64 of Third street, and extending down to Sixth street. The incorporators are W. C. Van Horn, of Montreal, in the province of Quebec (I may state here that he is the president of the Canadian Pacific railroad, an American railroad man with great experience in operating railroads, and by reason of his ability he was elevated to the presidency of that corporation, but he worked his way up on western roads in this country); Mr. O. D. Ashley, who is president of the Wabash road, and who lives in New York; Mr. Edmund R. Ostler, of Toronto, also connected with the Canadian Pacific; William W. Crapo, an ex-Congressman, lives in New Bedford, Mass. (he is a nephew of H. H. Crapo, who was formerly governor of this State, and he is the president of the Flint & Pere Marquette railroad, that runs here from Saginaw and Ludington); R. G. Butler, Detroit, Mich., is a stockholder, and he is the local manager, passenger agent of the Wabash road; Louis Pierce, of Portland, Me., and George Cappell, of New York, are connected with the Flint & Pere Marquette road; Alfred Stebbins and Frank H. Daman, both of Boston, Mass., are connected with the Detroit, Lansing & Northern (that road is owned by Boston people, the road that runs from here to Lausing and Grand Rapids); William L. Webber, of East Saginaw, is the land commissioner and attorney for the

Flint & Pere Marquette. Annexed to these articles is the necessary affidavit of Mr. Crapo and Mr. Cappell, two of the directors, that 50 per cent. of the stock has been subscribed and five per cent. has been paid in in cash at that time, and the company is properly organized under the law. Those articles were filed on the 24th of August, 1889.

Adjourned to Thursday, June 11, 2 p. m., to court-room No. 2.

65 June 11, 1891—2 o'clock p. m.

Mr. Baker: I offer in evidence the map and survey of the Fort Street Union Depot Company, certified by the board of directors on the 3d of October, 1889.

"We, the undersigned, majority of the board of directors of the Fort Street Union Depot Company, hereby certify that the company has surveyed its depot grounds and the route of its proposed track in the county of Wayne, and made a map and survey thereof, by which said route and depot grounds is designated, and have located the same according to such survey. We further certify that this map and survey is a true copy of the map and survey so made by said company. We hereby certify to the same for the purpose of having said map and survey with this certificate, filed in the office of the register of deeds of said county of Wayne, as required by law. Given under our hands and sealed with the seal of the said corporation on this 3d day of October, 1889.

WILLIAM W. CRAPO, R. G. BUTLER, O. G. ASHLEY,

Directors of the Fort Street Union Depot Company."

Upon this map and survey is the following indorsement: "State of Michigan. Approved this 8th day of November, A. D. 1889, pursuant to the provisions of sec. 7, art. 11, chapt. — of the Acts of 1883. John D. Rich, commissioner of railroads; G. R. Osmun, secretary of state; S. V. R. Trowbridge, attorney general, members controlling the board."

The route of this company commences at the east line of the Backus lumber yard, which would be on a line of Eighteenth street, if Eighteenth street were extended across Woodbridge

street, and then it runs on the red line of this map through the old depot grounds and along the south side of Woodbridge street on those grounds until they reach Twelfth street. It there crosses Twelfth street and goes into River street, proceeds along River street over the Michigan Central crossing, which is marked on this map, continuing along River street until it comes to the vicinity of Eighth street. It then angles off from the property to the corner of the alley on Sixth street and between Fort street and Congress street. It there reaches the depot grounds, which are marked on this map in blue, composing two blocks and a half, commencing at Third street, taking the block bounded by Third street and Fort street and Congress street, the next block west of it

and half of block next west of that. The depot grounds commence at Sixth street and extend through to Third street with these two blocks and a half of land.

Mr. Baker: I now offer in evidence the ordinance agreed upor between the city and the company, which was approved by the mayor November 19, 1889. As it is important to have this ordinance in full before you, I will read it at this time. I read from the Revised Ordinances of 1890, page 413.

"Whereas, the Fort Street Union Depot Company is a corporation under the laws of this State for the construction of a union depot on the southwest corner of Third street and Fort street west, in this city, and said company, for the purpose of furnishing access to said union depot, propose to build an elevated railroad in, upon and along River street from the west line of the Thompson farm to

the east line of lot No. 10 of the Labrosse farm; thence northeasterly to a point south of Fort street, north of Congress street, and west of the west line of Seventh street, thence across Seventh, Sixth, Fifth and Fourth streets, between Fort and

Congress streets; and

Whereas, the act under which said depot company is organized provides that the terms and conditions under which said elevated railroad company may be constructed in any street shall be agreed upon between the company and the common council; and

Whereas, the construction of said road may render it necessary to vacate Fourth, Fifth, Sixth or Seventh streets, between Fort and Congress streets, or to change the grade of Sixth or Seventh streets;

therefore,

67

SECTION 1. It is ordained that the terms and the conditions for the construction of said railroad along River street shall be as follows:

That is to say, the superstructure of said elevated railroad shall be supported by iron posts not more than fifteen feet square, or in diameter; that said posts shall be set along the line of the curbing now in said highway, and outside of the roadway and curbing, so that the superstructure will stand the entire roadway or paved portion of said highway; said posts shall be not less than thirty feet apart along said curb-lines, except in crossing the Michigan Central railroad, where they shall be so placed as to be most convenient for both roads; said posts shall rest wholly upon solid foundations of masonry, wholly beneath the surface of the street, and such posts shall be of such length that at no point on the line of said road shall the space between the surface of said River street, or any street leading into said River street, and the superstructure be less

than thirteen feet in the clear; and no posts shall be placed within or between the curb-lines of any street leading into or intersecting said River street, or within the lines of side-

walk upon such intersecting streets.

In case said roadway shall be constructed across and over any of the said Fourth, Fifth, Sixth or Seventh streets, the superstructure shall be supported either by stone walls, erected on the street lines, or by iron posts, not more than fifteen inches in diameter, which shall be set so as to span the entire roadway of said streets, and

none of which shall be set between the curb-lines of either of said streets, or within the sidewalk lines thereon; the said posts shall rest upon solid foundations of masonry, wholly beneath the surface of the said streets; and at no point on either of said streets, provided the roadway shall be constructed over either of said streets, shall the space between the surface of the street and the superstructure he less than thirteen feet clear under said structure; and the super-structure shall consist of iron and steel girders and ties, having an aggregate highth of five feet, substantially as shown by the crosssection thereof filed by said company with the city clerk, with a map showing the route of said railroad along said River street; and the location of the posts for the support of the superstructure, as proposed by said company, and which cross-section and map are made a part of this ordinance. Suitable iron pans or shields, to catch the ashes and refuse from locomotives, shall be constructed under the tracks of said elevated railroad, along and on River street, and over any other street above which said roadway shall be constructed. And the said company shall cause to be properly lighted, to the satisfaction of the board of public works, the said River street, under said superstructure, and any street crossing over which roadway may be constructed.

69 Sec. 2. The said company shall keep the posts and superstructure of said elevated railroad in good order and repair, and in constructing the same shall obstruct the streets for a reason-

able time only.

SEC. 3. In case the common council should, in its discretion, at any time hereafter resolve and determine to vacate the said Fourth, Fifth, Sixth and Seventh streets, or either or any of them, and take the necessary steps and proceedings to vacate the said streets or either of them and the same or either of them should be vacated, the said Fort Street Union Depot Company shall pay all the costs and expenses of such proceedings, and shall pay all damages which may be awarded in said proceedings to any person or persons by reason of such vacation.

Sec. 4. In case the said roadway should be constructed by said company over the said Fourth, Fifth, Sixth or Seventh streets, or over either of said streets, at a height leaving a space less than thirteen feet in the clear between the present surface of such street and the superstructure of said roadway, and the common council should, in its discretion, at any time hereafter, resolve and determine to change the grade of either or any of said streets, and the same be changed, the said Fort Street Union Depot Company hereby agree to pay all the costs and expenses of such change and alteration of grade, and to pay all damages that may be awarded to any person or persons by reason of such change of grade, and fully to indemnify the city against any and all claims, award of judgments that may be so recovered against the city by reason of such change of grade

Sec. 5. The said company shall acquire, by purchase or condemnation, from the adjoining property-owners, the right to build said elevated railroad in said street, as required by the constitution and

laws of this State.

70 SEC. 6. In consideration of the police and fire protection, and in lieu of local taxes, the said company shall, and it hereby agrees to pay to the city treasurer on or before the first day of July in each year, two and one-half per cent. of the gross earnings of said company, as determined by the State railroad commissioner and auditor general, in pursuance of sections 19, 20 and 21 of the union depot act of 1881, provided, that if by any change in the constitution or laws of this State the company should hereafter be required to pay local taxes, then the company is to be credited upon the percentage herein stipulated, with the amount of local

taxes it may be required to pay. Sec. 7. The said company shall, within thirty days after the passage of this ordinance, file a written acceptance of the terms and conditions with the city clerk, and shall procure from the owner or owners thereof a deed to the city of Detroit, dedicating to the public use as a street all that parcel of land in the city of Detroit, in the county of Wayne and State of Michigan, from River street to the channel bank of the Detroit river, included between the lines of Twelfth street extended, except the part thereof owned by the Michigan Central Railroad Company, and the same to be kept open and clear for public use, and shall cause said deed to be filed with the controller of the city, and said company shall execute and deliver to the city of Detroit a good and sufficient bond in the penal sum of five hundred thousand dollars, to be approved by the common council, conditioned for the faithful performance of the terms and the conditions of this ordinance, and to fully indemnify and save harmless the city of Detroit from any and all claims for damages,

for which the said city may be made or become liable to pay 71 by reason of the construction, maintenance or operation of said railroad or superstructure. This ordinance shall take effect upon the filing of said acceptance, the delivery of said deed

and the approval of said bond."

Mr. BAKER: I will next offer in evidence the order of the State railroad crossing board, which I have not here at present, and which may be hereafter read, which order they made when they indorsed their approval on the map and survey in making that order that directed the Fort Street Union Depot Company and the Michigan Central Railroad Company to build a viaduct for teams alongside of the elevated road, and in the order they reserve to the commissioner of railroads the right to approve the plans that might be adopted for the building of that crossing. In pursuance of that, the Fort Street Union Depot Company submitted a plan to the railroad commissioner for approval, and I now offer that plan in evidence, with this indorsement:

"Office of the commissioner of railroads, Lansing, Michigan, August 5, 1890. This plan of a proposed viaduct or overhead passageway for the use of teams and footmen at the crossing of the tracks of the Michigan Central railroad and River street, to be erected by the Fort Street Union Depot Company in pursuance of the order of the undersigned of April 3d, 1890, is hereby approved. John T.

Rich, commissioner of railroads."

This plan relates to the crossing of the Michigan Central track. The track of the Fort Street Union - Company is represented by these two double lines that come across the corner of Twelfth street and go into River street, with their girders at this point, and it is to run along River street until it goes over the Michigan

Right alongside of this superstructure this plan 72Central. provides for an approach made of masonry; by turning slightly to one side, there is an approach, an incline, on which you reach a bridge, on which you go over the Michigan Central Railroad crossing and come down on the other side into the street again, so that there will be an elevated railroad through there, and a passageway for teams and foot travelers right alongside of it. The foot travelers will go on a small elevated sidewalk, reaching it by going up a flight of stairs, go over on a little iron-work across the Michigan Central track, and go down on the other side This will be more fully explained by the engineer.

CHARLES H. Ellis, sworn for petitioner.

Examined by Mr. Baker:

Q. What is your business?

A. Civil engineer.

Q. How long have you lived in Detroit?

A. Some fifteen years.

Q. Are you the engineer of the Fort Street Union Depot Company?

A. Yes, sir. Q. Have been from the commencement of the enterprise?

A. Yes, sir.

Q. The grounds of that company occupy two blocks and a half, as I understand it, on the corner of Third street and Fourth street? A. Yes, sir.

Q. About what is the area of those two blocks and a half?

A. About five acres.

Q. Will you state whether or not that is a suitable piece of land, with respect to size and location, for the erection of a union passenger-house in this city?

A. Yes, sir.

Q. Is it any more land than is needed for the depot grounds and for the depot?

A. No, sir.

Q. Are you familiar with the plans that have been adopted for the construction of a depot there, familiar enough to tell us where the depot will be located, and the size of it?

A. I am not fully acquainted with the architectural details. I

know the ground plan of the building.

Q. How long is the depot to be on Third street?

A. The depot proper, the head house, the corner is at Third and The frontage on Third street extends from the corner of Third down across the alley, some 150 feet front there.

Q. About how long is it on Fort street?

A. On Fort street it extends something like 90 feet, full h-ight, with an L running the entire length of the block and across Fourth street and into the next block some 60 feet, making the entire frontage on Fort street some 420 feet.

Q. What else is to be constructed there besides this passenger-

house?

A. I understand that two of the companies contemplate a local freight building on Congress street.

Q. On Congress street, corner of Third street?

A. Yes, sir.

Q. How do you reach these grounds from the old union depot grounds?

74 A. By connecting line of railroad, beginning on the old

depot grounds near the west end.

Q. Where are those old depot grounds located, between what streets?

A. Between Twelfth street, extending nearly to Eighteenth-and-a-half street and from River street to the river.

Q. Were you the engineer of the old union depot company?

A. Yes, sir.

Q. That yard down there is occupied by the Wabash?

A. Yes, sir.

Q. Any other company there?

A. No other company in there, except the Canadian Pacific.

Q. The Canadian Pacific does some business there?

A. Yes, sir.

Q. What kind of a railroad is it proposed to have constructed between the old union depot grounds and these new grounds?

A. An elevated road.

Q. Were you consulted by the board of directors when this route was adopted by them?

A. Yes, sir.

Q. Did you prepare a survey of the route?

A. Yes, sir.

Q. Did you examine the property in that vicinity with a view of ascertaining the best and most feasible route?

A. Yes, sir.

75

Q. Will you go on and state why you adopted the route providing for an elevated structure along River street, what were the reasons that led you to adopt that plan?

A. This is the sketch covering the whole grounds.

Q. What I want you to do is to explain to the jury why

you go along River street?

A. This sketch is a map of the section of the city embraced between Third street and Eighteenth street, and between Fort street and the Detroit river, showing at the east end of the map the location of the Fort Street Union Depot Company, the point where the contemplated passenger station is to be. The question was presented to me to examine the city, and a section between this corner and the old Wabash grounds, or the old union depot grounds, and to find a line for the connecting road between this passenger station

THE FORT STREET UNION DEPOT CO.

and those grounds, and I examined that section in reference to running through this property, through the street, in different ways in which it might be done.

Q. What property do you refer to?

A. I mean the property between River and Fort streets.

Q. Can you give any reason why you did not adopt the line

through the property between River street and Fort street?

A. The elevation of Fort street is more or less higher than River street, nearly 22 feet at the corner of Third street, Fort street is nearly 22 feet above River street. River street is nearly level, not varying over two feet between here and the Michigan Central rail-Fort street runs down gradually to Tenth or Eleventh streets, where it rises somewhat to go over the Michigan Central railroad. In running along the Fort Street frontage in this way, with this elevation, we would have to cross these streets at such an elevation that they would all have had to have been closed.

Q. This railroad track would have been so near the sur-

face?

- 76 A. So near the surface that a grade crossing would have been almost impossible, aside from the fact of the danger.
- Q. You mean to say that Fort street is nearly 22 feet higher at the corner of Third street than River street is at the Michigan Central depot grounds?

A. Yes, sir.

Q. Quite a hill there?

A. Yes, sir.

77

- Q. It is higher the whole distance, not being quite so high at Tenth street?
- A. Not quite so high at Tenth street. At Sixth street it is about 16 feet higher than River street.

Q. What is it at Seventh street?

A. It is about 14½ feet, and at Tenth street it is about 13 feet

higher than River street.

- Q. Will you state what is the general character of the property that is situated in this block that extends from Twelfth street through to Third street, and between River street and Fort street west?
- A. Beginning at Twelfth street, about one-half of this block is occupied by an inferior class of buildings, and there are some old residences on the River Street frontage. The remainder of this block is occupied by A. Backus & Co.

Q. Is that a large planing mill and box factory?

The next block is occupied by the Michigan Central railroad; the frontage on River street and on Fort street there are some old residences there. The next block is occupied almost entirely by the Peninsular Stove Co., Union Mills property and the Diamond Match Co., and the next block on the Fort Street front is occupied by residences, and on the River Street front this

corner is occupied by the Hammond Beef Company, and the remaining portion of the property was occupied by manu-

facturers, which property has been purchased.

Q. If any route was laid out along this block, it would be necessary to go through the Backus planing mill, and also through the property of the Peninsular Stove Co.?

A. Yes, sir; it would destroy those industries, as it did these two

at that corner.

Q. You would destroy a large amount of valuable manufacturing

property, and you would also close a number of streets?

A. Yes, sir, and we would not obtain as feasible a line for rail-road operation. The profile of this line, as adopted, is shown by this sketch above, which represents the grade as beginning nearly opposite Fifteenth street, rising on the grade 50 feet to the mile to Twelfth street, and with a grade of 20 feet to the mile to the Michigan Central railroad, and with a continuous level grade to Seventh street, crossing all these streets a sufficient height for abundant clearance and with a slight descending grade.

Q. Will you tell us why you did not lay out a route through the

property of the Michigan Central railroad?

A. I was advised by legal counsel that we had no legal right to locate there. A parallel route to this, either on the Michigan Central property or on the immediate front of River street, would have presented just the same profile. It would have taken these industries on that side.

Q. The only reason for not surveying the route through the

Michigan Central property was a legal obstacle?

A. Yes, sir.

Mr. Charest: If I understood you well, you went and surveyed that land after receiving instructions from the company to do so?

78 A. After receiving instructions to find a line between this point and that point.

Q. You said, as I understood, you made a survey of that land. You acted upon their commands to go and survey that land?

A. You did not understand me exactly.

Q. When you were sent to survey that land was that your own survey or the order of the company to go and survey that land?

A. I don't exactly understand you.

Q. When you went and surveyed that land, you went under the instruction, as an engineer, that you had received from the company, was it not?

A. Yes, sir; to survey a line.

Mr. Baker: Did the company locate the line until you went to locate it?

A. No, sir; I made a survey of different lines, some of them through this property, one of them as shown here, and different lines on different courses, and I presented it all to them for consideration. They came to the conclusion to take River street.

Q. With the report which you gave them in regard to the

feasibility of the different routes?

A. Yes, sir.

Q. Did you recommend any route?

A. I recommended this route.

Q. Why did you recommend this route?

A. Because this route is free from objectionable grades. destroys the least property, does the least injury and it does the least public inconvenience.

Q. Will you state how this railroad is to be constructed along River street, how it is to be constructed in the street? Describe the

manner of construction.

A. It is to be an elevated railroad, supported by steel-plate 79 girders, supported on steel posts, as required by the ordinance of the city, certain distance apart.

Q. How far apart will your posts be longitudinally along the

curb?

A. West of the Michigan Central Railroad crossing they will be 35 feet from center to center. East of the Michigan Central Railroad crossing the span from curb to curb is greater; the width of the pavement is greater.

Q. That is, there will be a row of posts upon the curb on each

side of the pavement?

 A. Yes, sir.
 Q. West of the Michigan Central crossing those posts will be 35 feet apart? A. Yes, sir.

Q. And east of the Michigan Central crossing they will be 30 feet apart? A. Yes, sir.

Q. How wide is the pavement east of the Michigan Central crossing?

A. 40 feet. Q. How wide is the pavement west of the Michigan Central crossing?

A. 34 feet.

Q. How far apart will your posts be laterally across the street?

A. The available width of the paying in the clear, not from center. to center, but in the clear.

Q. That is, the posts will be on the curb line? A. Yes, sir.

Q. So that the entire paved portion of the street will be left open? 80

A. Yes, sir. No part of the posts shall be within the paved

portion of the street.

Q. Will those posts that go longitudinally up and down the curb line, 30 and 35 feet apart, will the posts on the opposite side be directly opposite?

A. Yes, sir.

Q. And, as I understand it, a lateral girder will run from one post to another across the street?

A. Yes, sir.

Q. How high above the paved portion of the street will the lower part of that girder be?

A. 14 feet.

Q. Are they all of the same height?

A. Not exactly; the lowest height will be 14 feet.

Q. What will be the greatest height?
A. On the laterals there is not much difference in front of the Backus property.

Q. Along the street?

A. This is an elevation of the viaduct in front of the Backus property.

Q. You say these lateral girders running across the street, the lower portion of the girder will be 14 feet above the street?

A. Yes, sir.

Q. How are the longitudinal girders placed?

A. On top of the laterals at this point.

Q. Do they go on top of the lateral girders the whole distance of the superstructure?

A. No.

Q. How are they fixed at other places?

A. They are riveted to the side of the lateral girder, not in all other places.
Q. They go end on to lateral girders?
A. Yes, sir. 81

Q. In front of the Backus property they are entirely on top?

A. Yes.

Q. How deep up and down are the lateral girders?

A. About six feet.

Q. How deep are the longitudinal girders up and down?

A. Three feet nine inches.

Q. How many longitudinal girders do you have along this structure?

A. One under each rail.

Q. How many tracks are to be built along this railroad?

A. Two in certain distances, and three the remaining distance. Q. Does the blue print that I now show you contain the plan of , the superstructure the entire distance in River street?

A. This is the general plan of the superstructure in River street. Q. Does it conform to the plan approved by the railroad commissioner?

 A. The posts are in the same position.
 Q. The extreme left hand or end of this blue print represents Twelfth street, does it not?

A. Yes, sir.

- Q. What do the two double lines represent that go across Twelfth street?
- A. Those represent the track or the girders, which are immediately under the rails.
- Q. Do you mean to say that longitudinal girders will be placed immediately or nearly under each one of those lines? 82 A. Yes, sir.
- Q. And the lateral girders will be used to support those longitudinal girders?

A. Yes, sir.

Q. What do these white marks represent?

A. The position of the posts. Q. That represents the posts? A. Yes, sir.

Q. What do these lines across the street represent?

A. The cross-girders or lateral girders.

Q. I find three lines of posts here, one on the north curb line, one on the south curb line, and another one partially on the property of the Michigan Central?

A. Yes, sir.

Q. What is the object of placing these posts there?

- A. Because our south track is over the Michigan Central property.
- Q. That is, you do not go into River street until you go some distance east of Twelfth street?

A. No, sir.

Q. So that the first lateral girder across River street is in front of property owned by A. T. Boy on?

A. Yes, sir.

Q. And you carry the tracl y a lateral girder swung over two posts south of the posts on the curb line?

A. Yes, sir.

Q. Does this plan show that the superstructure for the elevated road gets wholly in the street by the time it reaches the property of Mary Speck?

A. Yes, sir.Q. There the posts on the Michigan Central property cease, 83 and from thence east they run along the curb line?

A. Yes, sir.

Q. According to this plan there are only two tracks from Twelfth street until you get to the easterly end in front of the property of Mr. Backus

A. Yes, sir.

Q. And then does it divide into three tracks?

A. Yes, sir.

Q. Is there room enough upon that 40 feet of superstructure over the pavement there to carry three tracks?

A. Plenty.

Q. Those three tracks continue into the depot grounds?

A. Way up to the depot grounds.

Q. What do the posts south of the street represent?

A. They represent the place where posts for a road viaduct can be placed.

Q. What does this represent? A. That represents a masonry approach for the highway.

Q. That commences on a level with the street and ascends until it comes over the Michigan Central and then goes down on the other side ?!

A. Yes, sir.
Q. What is the grade of that viaduct for teams?

A. One foot in 25 feet.

Q. Is it all one grade from the time it starts here until it gets to the summit, and then the same grade down on the other side?

A. It is all the same grade up to the Michigan Central crossing,

and then it is level across that.

Q. These dotted lines represent the tracks of the Michigan Central railroad at that crossing?

A. Yes, sir.

Q. And the viaduct for teams is on a level when it reaches that crossing until it gets over it?

A. Yes, sir.

Q. And it goes up and comes down on a grade of four feet to the hundred?

A. Yes, sir.

Q. How wide is the viaduct for teams?

A. By order of the railroad commissioner, 24 feet.

Q. Have you made a sketch of this superstructure as it will be erected in front of the Backus property?

A. Yes, sir.

Q. You can now show that.

Mr. Charest: Did you ever survey the south side of River street for a route?

A. It would be just the same as this.
Q. Did you ever make a survey?

A. No.

Mr. Baker: There would not be any difficulty in building a line to the Michigan Central grounds?

A. No engineering difficulty.

Q. In fact, the Michigan Central grounds are about on a same level with River street, so that if you could do it, you could run a line to the Michigan Central grounds, the same as you are building it in the street?

A. Yes, sir.

Mr. Charest: All I want to know is whether you made a survey on the south side of River street?

A. I never have set any stakes on the Michigan Central property.

Mr. Baker: And you were told by the officers of the company
that you had no right to go there?

85 A. Yes, sir.

Q. It was something which was not under your control?

A. Yes, sir.

Q. You had no right to go there?

A. No.

Q. You did not undertake to settle the legal difficulty and go there whether or no?

A. No, sir.

Q. Is this the superstructure as it is to be built in front of the

Backus property?

A. Yes, sir; the floor plan. This is the floor of the bridge, showing the rails, ties, bond timber, and everything that will appear looking down on the surface.

Q. This represents the entire distance in front of the Backus property?

A. Yes, sir.

Q. Some 338 feet?

A. Yes, sir. Q. This is the street line of it?

A. That is the street line.

Q. The upper line is the street line of the Backus property?

A. Yes, sir.

Q. And the street line of the Michigan Central property is the line on the bottom of this map?

A. Yes, sir.

Q. Will you tell us what these lateral marks represent?

A. Cross-girders.

Q. At the end of each cross-girder?

A. Those are the posts.

Q. What do these marks represent—the lateral marks?

A. The cross-ties.

Q. What do the black lines upon those represent?
A. The rails. 86

Q. The rails on which the cars are to run?

A. Yes, sir.

Q. Will you tell us how long these ties are?
A. Nine feet.

Q. What do the lines in the ends of these ties represent?

A. Those represent bond timber, put on to hold the ties in place.

Q. Describe the construction of that.

A. These ties are sized down to a uniform depth, sized about a half an inch less than the depth. They are 8 x 8 inches square, sized down to 71 inches, and the girders are spaced 14 inches apart, and an opening six inches between each tie, and this is a bond timber, notched down two inches and bolted there.

Q. Is that timber eight inches square?

A. Six by eight inches, laid flat so as to be four inches high, the height of the grade.

Q. That is litted on the top of the ends on each side?

A. Yes; and that is bolted to the bond timber into the tie into the outside of the girder.

Q. From the outside of the bond timber of one side to the outside of the bond timber on the other side will be the length of the tie?

A. Yes, sir.

Q. Commencing upon the westerly end of the Backus property, what, if anything, will be built between these two tracks?

A. There is nothing there of any use to the railroad company. Q. Will anything be built there, is my question?
A. Not that I know of.

87

Q. Your plan does not provide for anything?

A. It does not provide for anything there.

Q. Will you tell us how far these tracks will be at that point in the clear, between the bond timber?

A. That space is open.

Q. Tell us how wide it is at that end?

A. Nine feet.

Q. Does it maintain that width any considerable distance?

A. About 70 feet from there it is a little more, ten feet, and then it narrows up to no space at all, the whole distance being covered with long ties.

Q. How far?

A. About a bent and a half; about 50 feet.

Q. Beyond that how is it?

A. Beyond that there are two openings, which at the extreme point are four feet apart.

Q. That is, this track divides or separates, so that you have three

tracks?

A. So that we have three tracks from this point.

Q. Three tracks in front of the mill?

A. Just about the middle of his property.

JUROR: Does the mill occupy the whole width of the property?

A. No, sir.

Mr. BAKER: The mill is over to this end of it. You will go down and look at it.

Q. The center of the property would be where these ties have commenced to materially widen?

A. Yes, sir.

Mr. Dickinson: I understood you correctly that this distance and this open apace is 50 feet?

88 A. I said from that point to this point is about 50 feet.
Q. The whole distance of the property is 238 feet, so that this would be 119 feet up to that point?

A. Yes, sir.

Q. So that practically the west half of the property has two tracks, and the east half of the property three tracks?

A. Yes, sir.

Q. Where will your switch be located?

A. Where they are shown here—at that point, at this point, and at that point.

Q. So that you can run from one of these tracks to the other? You can run from the two outside tracks onto the center track?

A. We can run from the center onto either of the other two.

Q. Will you tell us how far it is from the north bond timber on

the west line of this property to the street line?

A. I have marked in pencil the distance at this point. It is 12 feet 7 inches at this point; it is about 13 feet at that point.

Q. Will anything be put in there?

A. No, sir.

Q. At the first posts in front of this property, it is 12 feet 7 inches?

A. Yes, sir.

Q. What is it at the next post?

A. Eleven feet.

Q. At the next post?
A. Nine feet six inches.

Q. And the next one?

A. Eight feet.

Q. And the next?

A. Seven feet three.

Q. And the next?

A. Six feet.

89

Q. And the next one? A. Six feet.

Q. The width of the sidewalk is six feet? A. Yes, sir.

Q. At the easterly end of this property, you take the whole width from curb to curb, with the exception of the open spaces between the two tracks?

A. Yes, sir.

Q. Anything built in there to obstruct the light?

A. No, sir.

Q. Can you tell us where these paus or shields referred to in the ordinance are to be constructed?

A. It simply requires that they shall be under the locomotives. Q. The railroad iron is represented by these black lines?

A. Yes, sir.

Q. Where would the longitudinal girders be?
A. Right under those.

Q. A little wider?

A. A little wider; the track from center rail is five feet. These rails will come on the inside edge of the girders. The girders are six feet and a half centers. It comes on the outside of the flange.

Q. Will these pans and shields be constructed between these

longitudinal girders?

A. Yes, sir.

Q. So as not to catch anything that falls from the ties?

A. Yes, sir. 90

Q. Outside of the girders, in these vacant spaces, there will be no shields?

A. No, sir.

Q. That will all be left open?

A. Yes, sir.

Q. Both where there are only two tracks and where there are three tracks?

A. Yes, sir.

Q. Have you made a side view or elevation of the superstructure in front of the property of A. Backus, Jr.?

A. Yes, sir.

Q. Does this represent it?

A. Yes, sir. That is four feet to the inch, and this other sketch ten feet to the inch.

Q. What does that darkest line represent?

A. The very upper line is the top of the rail. Q. The top of the rail or bond timber?

A. Either; they are the same height.

Q. The darkest line represents the ends of the ties?

A. Yes, sir.

Q. What is the space immediately below the ties?
A. That is the longitudinal girders.

Q. What do the dotted lines upon these posts represent?

A. Those are the cross-girders.

Q. It represents the end of the cross-girder?

A. Yes, sir.
Q. What does this bracing across here represent? A. That is the bracing between these two posts.

Q. Why do you put that brace in there?

A. It is necessary to brace at certain intervals certain sections of the viaduct, which have to be made rigid like piers. 91 Q. How high will that bracing be above the street?

A. Fourteen feet at least.

Q. The same hight at the lateral girders?

A. Yes, sir.

Q. Will you go on and tell the jury what the distance is from the street to the bottom of the longitudinal girder at the most westerly posts on the Backus property?

A. About 18 feet and a half. At the base it is 18 feet 9 inches.

Q. At the next post?

A. 19 feet 1 inch.

Q. Give the distances at the other posts.

A. 19 feet 9 inches; 19 feet 5; 20 feet 1 inch; 20 feet 5 inches; 20 feet 9 inches.

Q. So that there will be that amount of open space, except whatever space is occupied by the lateral girders running across the street ?

A. Yes, sir.

Q. Between the lateral girders will be on the average in front of this property an open space between 19 and 20 feet high?

A. Yes, sir.

Q. Do you preserve the 14 feet all the time?

A. Yes, sir, we have to make a lateral girder less deep and strengthen the bottom plank.

Q. Does the longitudinal girder go on top of the cross-girder there?

92

A. Yes, sir.

Q. It does not go end on?

A. No, sir. The next one we will have to connect on the side, because I could not get depth enough here?

> Q. You say the next post goes end on? Yes, sir, because I could not get 14 feet.

Q. Will you explain the necessity of this bracing a little

more in detail?

A. In a structure of this kind it is necessary to provide for expansion and contraction, which amounts to considerable, and for that purpose we leave one end of the girders open every third bent.

Q. What do you mean by leaving them open? A. They are not bolted to the cross-girders.

Q. Suppose you had a superstructure of this kind and bolted together solid, the whole length of it, what would become of it?

A. There is no power that could stand the expansion and con-

traction, and it would tear it to pieces.

Q. This climate, the difference of temperature causes an iron or steel superstructure to expand and contract?

A. Yes, sir, that is considerable from the extreme cold of winter

to the extreme heat of summer.

93

Q. About how much play do you allow for on the end of one of these sections?

A. In this distance something over an inch.

Q. How do you construct that?

A. In this point it rests on top of the girder. In the bottom flange of the longitudinal girder are slotted holes, through which bolts are placed to prevent it moving laterally. The girder can expand and contract through that slotted hole. In providing for this expansion and contraction, unless we braced at the end of this girder, the whole structure would move back and forth, so every third bent it is necessary to brace and make rigid like a pier to resist this thrust.

Q. What you mean is, that every third bent is a fixed bent, it is fastened right there?

A. Yes, sir; and this brace has to be fastened and connections made in a proper way so as to resist the thrust which we calculate is coming there. That thrust is the grip of the driving wheels of the locomotive on the rail. The locomotives have to take hold of the rails to draw the train. When it takes hold of the rails going ahead, it pulls the structure back. When the train stops with the brake applied, it is greater, and that is a force tending to push the structure ahead. That force has been very accurately determined by experiment on the stopping of trains in the use of the Westinghouse brake, and from that we calculate what the thrust will be on the bridge, and by bracing the frame to resist that thrust, we make every third bent rigid.

Q. Describe how you make a foundation to carry so much weight. A. I have already some sixty of these foundations finished and they are covered up. We determine first the weight that is coming on the foundation. It is the weight of the structure, the weight of the train, and we can calculate very close what the exact weight will be on the foundation.

Q. Do you get that down to a minimum, or up to a maximum? A. Up to a maximum weight that can come on it. The bridge is designed to carry, if necessary, two locomotives on each track, followed by a train of three thousand pounds to the foot. These locomotives weigh 210,000 pounds, 105 tons. Those are about the

heaviest locomotives that are used.

Q. Do you mean to say that this superstructure will carry two

trains with double locomotives?

A. Yes, or three, wherever the three tracks are, if they ever happen to be that. That is as great a load as ever can come upon them. With that load and the weight of the superstructure

we know what the weight will be upon the foundation, and the judgment has to be used, whether the earth, which we find below it, is sufficient to sustain that weight, and we lay the foundation according to our judgment, and distribute the weight over the area necessary for that.

Q. Did you examine the ground along the line of these posts?
A. I excavated there last year, boring down to the depth of 18 or

20 feet below where we shall go.

Q. What did you find?

A. I found, after going through the main earth along the south side of Woodbridge street, a gray, hard clay, and below that the universal blue clay that underlies Detroit.

Q. How do you commence to build the foundation?

A. We excavate into this hard, stiff, gray clay. I don't go through that. I load that in no case over a pound and a half to the foot—it is perfectly safe with that load—and proportion the size of the area, and I form the foundation of Portland cement all the way from eight to ten, eleven, and twelve feet below the surface of the street.

Q. Suppose you find soft dirt down there, what do you do?

A. Drive a number of piles. At the Michigan Central Railroad crossing, I have already driven piles there. I could not find any reliable stiff material at sufficient depth, and I have driven piles.

Q. How many piles would you put in for a foundation?

A. According to the weight the posts are to carry. These posts carry from 80 to 300 tons, and I design never to load piles in any case over twenty tons. These piles are driven down to the surface of the ground and driven with a follower seven feet below the surface, calculated to penetrate the stiff clay at least ten feet.

Q. Is there any difficulty in preserving a pile down there?

A. No; because the top of the pile will be from two to three feet below the level of the Detroit river. They will always be damp.

Q. Won't they rot?

A. No, sir.

Q. Never?

A. No, sir; not to trouble us.

Q. That is the experience of engineers?

A. Yes, sir; we find timbers that have been buried for long ages and no indication of rot.

Q. Is there any engineering difficulty in constructing a post that will carry this weight?

A. No, sir.

Q. Describe the construction of the post.

A. These posts are made of plates and angle iron riveted together.

Q. Is it a square post?

A. It is a square post, but not a hollow post.

Q. Where does the strength come, in the angle of the iron?

A. Yes, sir.

Q. These angle irons are bolted together and make a very strong post?

A. Yes, sir; all the surfaces can be reached and kept painted.

Q. The post is left open so that you can paint inside of it? A. Yes, sir.

Q. Is that necessary in order to keep the material from rusting?

Yes, sir.

Cross-examination by Mr. Dickinson:

Q. How long have you lived in Detroit?

A. About fifteen years.

Q. Where did you come from, here?

A. I came directly here from Massachusetts.

Q. You have been engaged in the railroad business? A. I have been connected with railroads since '63.

Q. Were you ever engaged in building any road before?

A. Yes, sir; I was connected with the Hoosac Tunnel road. I was resident engineer at the east end of the Hoosac tunnel and had charge of the Ware River branch of the Boston & Albany.

Q. Who laid out the routes where you were division engineer-

who made the plans?

A. I did.

Q. You made the plans for the entire structure of the Hoosac Tunnel branch?

A. No; I was division engineer under the chief engineer.

Q. Who was the chief engineer?

A. Alfred R. Field.

Q. You attended to the construction?

A. Yes, sir.

Q. As to the branch road of the Boston & Albany, where is that? A. It runs from Palmer through Ware.

Q. What part of Massachusetts?

A. Palmer is fifteen miles west of Springfield.

Q. Is there any other road that you planned?

A. I had full charge of the construction of the Butler road from here to Butler, Indiana.

Q. That is the Wabash section?

A. Yes, sir.

97

Q. That was after you came here?

A. Yes, sir.

Q. Prior to your engagement for the union depot company, you were an engineer for the Wabash?

A. No; I never have been connected with the Wabash Company. I was connected with the company they call the Detroit, Butler & St. Louis railroad, which built this railroad.

Q. Were you the chief engineer of the Butler road?

A. Yes, sir.

Q. Did you make any entry into Detroit for the Butler road? A. When the Butler road was first finished we came to the Detroit junction.

Q. What was called the Grand Trunk junction?

A. Yes, sir.

Q. Laying out a route for the union depot company to approach this depot, you were the chief engineer, were you?

A. Yes, sir.

Q. Did you have any consulting engineer?

A. No, sir.

Q. It was all by yourself you laid out this route? A. Yes, sir.

Q. Did you consult with any engineers of the Michigan Central road in regard to the route?

A. No, sir.

98 Q. Were you given any directions as to what route you should take?

A. No.

Q. Did you consult with any one before selecting the route up River street, by the manufactories; did you consult the propertyowners?

A. No.

- Q. Before laying out the route submitted to the common council, did you consult the council?
- A. No. Q. Did you, before laying out the route, consult the State railroad authorities?

A. No.

Q. It has not been changed since you originally laid it out?

A. The map of location is the same as I made it.

Q. You have not swung it one inch in any direction since you originally laid it out and made your plans?

A. The map of location is just the same.

Q. You have not been influenced and have not changed it in any particular, except it may be in the method of crossing the Michigan Central track?

The route up River street is substantially as we presented A. No.

it to the railroad crossing board.

Q. And that is what you presented to the common council, what was presented in the petition of the company on which they based the ordinance, the route that you selected?

A. Yes, sir.

Q. Did you also lay out a route for the approach to the old union depot company grounds, the forty acres below Twelfth street? 99 A. Yes, sir.

Q. And the plan of approach to the old union depot

grounds?

A. Yes, sir.

Q. Between the Michigan Central property and the old depot grounds, there is Twelfth street?

A. That is all.

Q. Above Twelfth street lies the Michigan Central grounds to Third street, and below Twelfth street the old union depot grounds, consisting of forty acres?

A. Yes, sir.

Q. And still below the old union depot grounds, which end at

Eighteenth street, you laid out the transit road approaching the depot?

A. Yes, sir.

Q. Where does the transit road run? A. It is not shown on this map.

(). Tell the jury where the transit road runs below the union

depot.

A. The west end begins at Delray and crosses the Lake Shore and the Michigan Central and runs through the different properties about a thousand feet south of Fort street and almost parallel with it.

Q. How far from the river? A. The river is very circuitous.

Q. On an average, how far will it be from the Detroit river?

A. That would be a mere guess. At Clark avenue it is pretty near the river. Down by the fort it bends off a long distance, an average of a quarter of a mile.

Q. Is this a part of the Wabash system?

A. They run over this into Detroit, into these depot grounds.

Q. And this is to be the approach to the union depot and is a part of that scheme?

A. Yes, sir.

Q. That is the approach as projected so far?

A. Practically.

Q. And this is the transit road connected with the union depot scheme, which cuts through the Backus property below the old union depot property?

A. Yes, sir, his lumber yard.

Q. His lumber yard, where he receives from his water front?

A. Yes, sir.

Q. Do you know whether the transit road is an independent company by which the union depot is to be approached, or is it owned by the union depot company as a part of its corporate franchises?

A. I don't know that. I understand it is a different corporation.

Q. The transit road is a different road, and so organized?

A. I think so.

Mr. Baker: We object to Mr. Ellis testifying to that. Mr. Joy can testify as to that.

Q. (Referring to map.) Will you point out Tenth street. Tenth street has always run down to the Michigan Central yards across River street, to the Michigan Central yard?

A. Yes, sir.

Q. And what is the next street above, which has been cut through, from Fort to River streets?

A. Eighth.

Q. Eighth has always been cut through there to River?

A. Yes, sir.

Q. And never has passed on the Michigan Central grounds?

101 A. Yes, sir.

Q. And the next street is Seventh?

A. Yes, sir.

Q. And that never has come through River street?

A. No, sir.

Q. The same with Fifth street?
A. Yes, sir, Sixth, Fifth and Fourth.
Q. Third goes to the river?

A. Yes, sir.

Q. Point out the Backus property with reference to the Michigan Central crossing.

A. These three large buildings.

Q. And there is how many feet there?

A. 238 and a fraction.

Q. Tell the jury between what streets.

A. That is between Fort and River and between Twelfth and the Michigan Central railroad.

Q. Eleventh?

A. Yes, sir, but that is a questionable street.

Q. The Backus front of their planing mill and their works proper are on River street, are they not; they have an office up on Fort street?

A. This is where they do a good deal of business; they take their lumber there.

Q. And ship their goods there; local business?

A. I don't know about that; I know he receives lumber here, and they take lumber out there (pointing); that is where he takes his material, here.

Q. The planing mill itself is away below the grade of Fort

street?

A. It is on this level street.

Q. What is the difference between the grade of his front-102 between River street and Fort?

A. I cannot say exactly; it must be some 15 feet, at least. can judge by the Michigan Central bridge; that is 18 or 19 feet; that is higher than his front.

Q. I suppose that, if it were possible and legal, you could have passed on the same grade along the margin of the Michigan Cen-

tral yards and approached the union depot?

A. Yes, sir.

Q. And would not have crossed any of the streets up to the point of your turning across River street, by an elevated structure, and going to the union depot?

A. Taking the locations we have here, it would be commencing this curve further down and making a tangent on that property,

and going through there, that is all (pointing).

Q. Will you point out the Michigan Central property along which your road does run-point out the Michigan Central property, if you know, on both sides of the street?

A. The Michigan Central property runs from Twelfth through to Third. We pass all the way in front of that until we leave the

street, which is just west of Eighth street, and also own the property between the railroad and there on that side.

Q. How much of the Michigan Central property is occupied for the viaduct for teams, on the projected, proposed plan, in width?

A. On the east side about 11 feet; on the east side of the Michigan Central crossing.

Q. But on the Backus side?

A. On the Backus side they take there—they use the sidewalk; take the sidewalk out of 24; that would be about 18 feet to 20 feet of the Michigan Central on that side.

Q. This structure for teams is commenced about Twelfth

street, or back further?

A. No, sir, the structure for teams begins wherever this grade, which the commissioner fixed, meets this grade here, which is some 400 or 500 feet west of the crossing.

Q. But the way is open to approach that on the street itself?

A. Yes, sir.

103

Q. Uncovered by the elevated railroad structure, and out from

under the railroad structure?

A. I will have to refer to another map. To go up the elevated structure the route you would take would be to come from the west, right through Woodbridge street, and passing under these girders up to this point, and then striking right through there (pointing to map).

Q. That is not the entire structure?

A. No, sir, that is nothing; that begins at nothing and then commences rising.

Q. What is the extreme length of the elevated structure for teams that is provided on the Michigan Central side?

A. We can scale that.

Q. Give us the extreme length.

Witness scales it.

A. Fifteen hundred feet.

Q. Now we will resume our view of this thing. How is that

supported, upon masonry?

A. Part way. I cannot testify specifically about this because it has to be designed by the two companies jointly. I have provided in the construction of this railroad viaduet for its possibility in foundations; the details must be settled by the two companies, the

Michigan Central engineer and myself. I have designed in this way, to commence on the approach of masonry up to

the height of perhaps eight feet, then commencing an iron construction and continuing over the Michigan Central with iron construction, and down the other side until I reach an elevation again of about eight feet.

Q. You have on your plan all the way through a masonry con-

struction?

101

A. Oh, no, sir. Up to this point, that is to represent a wall of masonry here filled in with earth up to this point.

Q. And this is your reference to the Backus property (pointing)?

A. Yes, sir.

Q. And then what is beyond here according to your plan?

A. That would be open work, just bridge-work. That is probably the best construction to make there. That may be changed, because they may have some preferences in regard to its construction.

Q. How high is it in front, so far as it is in front of the Backus property there—the masonry, according to your plan?

A. That would be 220 feet; that would be nearly 9 feet high.

Q. What would be the width of the roadway?

A. 24 feet; that is the order.

Q. And that was to immediately adjoin the elevated railroad structure?

A. Yes, sir.

Q. If that immediately adjoins the railroad structure, and this is masonry to the height of 9 feet, so far as it is a bridge-work, that would hardly be the profile, in viewing it from the Michigan Central side?

105 A. It is not intended to have anything to do with the high-

way; it is simply the railroad.

Q. The profile to that structure, without taking into consideration the viaduct?

A. Yes, sir.

Q. So, beyond the elevated railroad structure, in making it a solid roadway, the roadway seems to be solid, that is, not upon girders or ties?

A. Not where the masonry was.

Q. So that the plans of the team viaduct and the railroad viaduct join right onto each other?

A. Yes, sir.

Q. Extending to the total width over onto the Michigan Central, how much? How much for your railroad structure; the total extreme width between the longitudinal girders, the outside longitudinal girders or the outside ties, which is the same thing?

A. Oh, no.

Q. The ties don't extend beyond the girders?

A. Oh, yes.

Q. You testified, as I understood, that they came even?
A. Oh, no; you misunderstood. The rails are just over the side of the girder.

Q. I mean these bond timbers, not the girders. The tie does not extend beyond the bond timber?

A. The bond timber is at the end of the ties.

Q. Now, from the extreme outside of the bond timbers, what is the width of the elevated structure in front of the Backus property?

A. You will see that that varies.

Q. Just give it.

106 Mr. Baker tells the witness to give it exactly, and the witness takes a map.

61

A. I scale that distance between the ties as 9 feet, $9\frac{1}{2}$ feet; that would be three times nine, $27\frac{1}{2}$ feet at that point.

Q. There?

A. Yes, sir; that is the extreme width. It would be 35 feet there (pointing).

Q. Give the mean distance here, near the centre?

A. Here is the centre, here.

Q. What is the distance at the centre across there?

A. 32 feet.

Q. And at this point here, where your other post is, I think, what do you call this mark here?

A. Yes, sir; that is a post.

Q. Give us the extreme width there?

A. That would be 33½ feet there.

Q. Then beyond that is extended the viaduct for teams, how much further?

A. That would be 24 feet.

Q. That makes at this point about 57 feet, the total?

- A. 24 and 26, 50 feet at this end; the extreme width here would be 35 and 24, 59.
- Q. This is the plan which you have shown, which you are now looking at, of the front of the Backus property?

A. Yes, sir; floor plan.

Q. That is what it was made for?

A. Yes, sir.

Q. (Showing another plan.) On your plan for this structure, with the elevated viaduct for teams along this side, is there any method, or manner, or way in which Backus can use this viaduct for teams in his business?

Mr. Baker: We will save an objection here. I object to any cross-examination or any examination in regard to the viaduct for teams, on the ground that that is something that is to be done by the Michigan Central Company and the Fort Street Union Depot Company, and it is not to be considered in this case.

Mr. Dickinson: I will insist on the question and proceed with it. Will you please tell whether, from the plans which have been discussed so far, as you have arrived at them, Backus could make any use of the viaduct for teams in his business?

A. I don't know of any, because I don't know what business he

does east of the Michigan Central railroad.

Q. It would be on the other side of the street from him?

A. Let me see the other plan. We can describe the situation here on this other plan. There is the entrance to the approach at this point. Mr. Backus' gates are here and there and there; there is where he goes in there, a gate there, a gate there, a gate there.

Q. It is perfectly plain he would not have any method to get up

on top of that to connect with his business there?

A. I don't know what his business would be. He would go there if he wanted to go uptown with his teams, or he could go underneath, on the Michigan Central.

Q. Underneath?
A. He could do that, or he could go back and go over.

Q. But there is no approach provided to drive up there with his business, is there?

A. To drive up there would not be feasible; I don't know what

he would want to do it for.

Q. (Showing another plan.) Will you tell the jury the space between the ties?

A. Six inches.

108 Q. What is the diameter of the ties?
A. They are 8 inches square.

Q. And the space between the ties is less than the tie itself?
A. Yes, sir.
Q. Then underneath all the track, under this ordinance, underneath every track is to be put the pan?

A. There is to be a protection there, a close protection.

Q. All the way through? A. Yes, sir.

Q. Making it a solid pan all the way under the tracks?

A. Yes, sir.

Q. Wherever there are tracks, switch-tracks or any tracks?

A. Yes, sir.

Q. Will you please tell the jury what is the height of the rail, the top of the rail above the roadway, the pavement of the street?

Witness takes side elevation.

A. We are on an ascending grade there and the street is descending, so it varies; at the east end the top of the rail is 21 feet 3 inches above the street, and at the west end of this property it is 25 feet 6 inches, an average of about 23 feet, or 23 and a half feet.

Q. I think you gave us the grade of the structure for teams. What is the grade in front of the Backus property, of the elevated

structure?

A. The rate of ascent?

Q. Yes.

A. It is shown on the plan there about 20 feet to the mile; 22 feet to the mile; four-tenths per cent. grade.

Q. What is the grade from the entrance; take the grade 109 from the commencement of the structure, on the old union depot property?

A. It is one per cent. grade, that is one foot per hundred, 52 feet

and eight-tenths per mile.

Q. That is the grade up or down?
A. That is the grade from the old depot grounds running up to Twelfth street; there the grade eases off to 20 feet up the Michigan Central crossing. I gave that in the testimony before.

Q. Do you know the height of the ordinary locomotive engine

above the track—the smokestack?

A. About 15 feet.

Q. And the top of the ordinary car above the track?

A. They run 10 and 11 feet.

Q. Eleven feet?

- A. Yes, sir; well, our sleeping cars and large cars will run up to 12 and 14 feet, some of them.
 - Q. How far will the cars project over the track itself?

A. Over those bond timbers do you mean?

Q. Yes.

A. That is 9 feet wide; our cars vary somewhat in width, from 10 feet, some 10 feet and a half, but not many of that size; the width of centers on some of the old roads prohibits their running over that; from the Harlem river to the New York Central depot the track width is only seven feet; there are certain cars that cannot go into that depot, so that 11 feet will give something and to spare on the average car; about 10 feet.

Q. Suppose that if the route on the Michigan Central property were legal as you say—

A. I don't say that.

Q. If it were legal as you say it is not, if you prefer to have it put that way—

110 A. I don't say it is not. That is a question for you.

Q. Any way you please; you would not be obliged to go through the Michigan Central property; you could take the margin of it, that is you would not be obliged to leave in coming up on the west side of your track, you could go up on the margin, right on the margin of the street?

A. Yes, sir. You remember the contest at Lansing, when you were there; you remember the morning you were there; the contest with the Michigan Central; you were a spectator there?

Q. I was there to argue a case in the supreme court, and I just

looked in.

A. There was a discussion with them about endeavoring to move beyond the Michigan Central property, to get the railroad commissioner to allow us to move to the south side of the street; he forced us to the north side of the street for the benefit of the public, to get this highway crossing in, forcing us away from the Michigan Central, when I would have liked to move onto them; I had a contest with the engineer in regard to keeping my line to the south.

Q. There was no one represented there except yourselves and the

Michigan Central?

A. That is all. It was a bitter contest between the two roads.

Mr. Baker: The commissioner was there, representing the public?
A. Yes, sir, and forcing us to give the highway structure which this company had no interest in, and this other company had.

Mr. Dickinson: The Michigan Central had an interest in the

highway structure, and you had none?

111 A. We hadn't, that I know of. We were endeavoring to get a line from one depot ground to the other.

Q. And thus the structure was planned to go where it is now suggested to go?

A. It was put there by the railroad commissioner.

Q. The location of the structure is settled; the method of the structure may be changed?

A. The location is fixed by the railroad commissioner.

Q. In going along this street along by the stove works and the Union mills, and the Diamond Match Company or the old Richardson match factory, which is still used as a match factory, is it not-

A. Yes, sir.

Q. -you discovered the old side track there, which had been there for many years?

A. Yes, sir.
Q. Which had been in use for loading freight from the stove works and the match factory and the Union mills and so on?

A. Yes, sir.

Q. Right up the street on the side, and they run engines in there, don't they?

A. Yes, sir.

Q. It is a broad-gauge track?

A. Yes, sir.
Q. They run the ordinary locomotive in there, and the ordinary freight cars of all descriptions?

A. Yes, sir.

Q. How are you going to get along without destroying that business?

A. We span the whole thing; we give them the clear standard height for locomotives and cars under it.

Q. And you won't interfere with them in the slightest 112 degree?

A. I don't think that we will.

Q. They can run their freight cars in there and load their flour and wheat and stoves and matches just as well as though you didn't have your elevated structure there?
A. Yes, sir.

Q. On this broad-gauge track?

A. Yes, sir.

Q. And you don't interfere with it or injure it?

A. No, sir. They have a franchise there of their road.

Q. That runs up pretty close to the manufacturers' buildings? A. It runs in the paved portion of the street, 15 feet away from them.

Q. Do you know how far your structure is away from the "L" of Backus' building that goes down on the lower part of his prop-

A. I did know. We measured it when we were on the ground

in the last case, but I don't remember now.

Q. And you don't remember from the main structure, either? A. I think it was 40 feet, but I have not got the minutes of it

Mr. Baker: Forty feet at one end and 38 feet on the other?

A. I have taken a good many measurements since then, and I have forgotten it.

A JUROR: Who surveyed the driveway on the Michigan Central ground?

A. That was ordered by the railroad commissioner.

Q. Did you survey it yourself?

A. No, sir; there was no survey made of it. 113 Q. Were you present when they consented to it?

A. Yes, sir.

Q. What is the width of it? A. Twenty-four feet.

Q. The whole upper structure is 35 feet at the extreme end?

A. The highway is 24 feet, and our width is from curb to curb,

whatever that is, 34 or 35 feet.

Q. Then if you had decided to take the Michigan Central side you would have taken the difference between 24 feet and 35 feet; there would be only 11 feet difference taken on the Michigan Central ground, to have your railroad pass?

Then the highway would have been on the north side.

Q. Then you would have left River street alone; you would not have any driveway then?

Mr. BAKER: We leave it alone now.

A. We don't touch River street except with the posts, just as telegraph poles touch the street; our posts touch the street and we leave it alone.

Mr. Dickinson: Except as you cover it with your structure?

A. That is not touching it.

Q. You cover it with your structure, and with solid pans under every track, do you not?

A. Yes, sir; right between the tracks.

Redirect examination by Mr. Baker:

Q. River street, the paved portion of River street is left open, so that Mr. Backus and every other property-owner and the entire public can go right along there the same as before?

A. Yes, sir. 114

Q. It is not obstructed at all?

A. No, sir.

Q. The Michigan Central has some 13 or 14 tracks across there? A. Thirteen.

Q. And in the controversy before the State railroad crossing board and in the supreme court, that has been carried on ever since this enterprise was started, the Michigan Central endeavored to get a ruling to close the street, did they not?

A. Yes, sir; they endeavored to make this company close the

street by putting abutments instead of posts there.

Q. And the work that you are doing down there is the work of building the elevated road?

A. That is all.

Q. You are not engaged now in building the viaduct for teams?

A. Nothing to do with it.

9 - -55

Q. That is something the commissioner ordered the two companies to do?

A. Yes, sir.

Q. And the commissioner in passing upon this controversy located the viaduct on that side?

A. The highway viaduct; yes, sir.

Q. And it was ordered put in there by the railroad commissioner in the public interest?

A. Yes, sir.

Q. Now suppose the Fort Street Union Depot Company had legal authority to go along the Michigan Central property with their railroad, then the viaduct for teams would have to be over on the north side and close to the property of Mr. Backus, would it not?

115 A. Yes, sir.

Q. And there would have to be an approach there that would be right in front of his property?

A. Yes, sir.

Q. So that his property would be cut off, it would be put below the grade?

A. Yes, sir.

Q. The same as it is at Fort street, and at Howard, and other streets where they have elevated the grade in order to get over the railroad?

A. More like Fifteenth or Fourteenth streets.

Q. Did the commissioner of railroads go down and examine that whole crossing, and examine it carefully?

A. Yes, sir

Q. There were three or four hearings before him and his associates?

A. Yes, sir.

Q. And there was a controversy carried on before him between the two companies?

A. Yes, sir.

Q. The Fort Street Union Depot Company objecting to any viaduct for teams, and objecting to the closing of that street or the interfering with it, and the Michigan Central insisting upon it?

A. Yes, sir.

Recross-examination by Mr. DICKINSON:

Q. Did the Michigan Central want to crowd the viaduct for teams on the other side?

A. They wanted to crowd our railroad on the other side, and I wanted to keep further to the south, away from the properties on the south side of the street.

Q. Do you say that the Michigan Central wanted to have the viaduct where it is, or that they objected to having it there; I mean the viaduct for teams?

A. They endeavored to put the viaduct for teams in the street, to force this railroad out of the street and prevent its construction; that was the object of the Michigan Central, the manifest object to prevent the construction of this line.

Q. They wanted to put it in the street, to close the street.
 A. Close the street, and close this project.

Q. They didn't want to close the street. If they objected to the union depot company approach, what excuse would they have for closing the street if they didn't let you approach up the street?

A. The excuse they gave us was that it was an objectionable

crossing.

Q. But they wanted to close the street, you say?

A. Yes, sir; they wanted to acquire that property there, which is now a part of their freight ground, which is apparent on this

Q. They objected; they wanted to have the street closed?

A. Yes, sir.

Q. For the purpose of letting you come up it?

A. No, sir.

Q. They wanted to have it closed anyway?

A. Yes, sir.

Q. They wanted to acquire that street themselves?

A. Yes, sir.

Q. Without letting you come up?

A. They would accomplish two objects.

Q. Did they want the street closed without letting you have an approach; let us have it. Will you state whether 117 the Michigan Central insisted upon having the street closed and also insisted upon not letting you come up that street?

A. I don't understand you.

Q. Did they insist upon having the street closed before the commissioner of railroads, and also insist upon not letting you come up that street?

A. They insisted upon having the street closed, which the com-

missioner decided he had no power to grant.

Q. Did they also insist upon your not going up the street if the street could be closed-let us have that. You have said that the Michigan Central made this objection in order to keep you from getting to your union depot?

A. Yes, sir.

Q. Did they at the same time insist that the street should be closed?

A. They insisted that the street should be closed; they did at that time, they did in the condemnation proceedings.

Q. Did they, if they got the street closed, object to your coming up the street?

A. That is another question; now let me answer that question.

Q. I want you to answer the question. You say they insisted upon closing the street. I want to know for what purpose. they say to the railroad commissioner that if that street should be closed they should not permit you to come up the street?

A. Oh, no, sir.

Q. Then they said if the street was closed you were perfectly wel-

come to go up the street, did they not; that if they closed the street you were welcome to go up the street, did they not?

118 A. Yes, sir, but at a different time. Q. Now I will have an answer?

A. I say, yes, but at a different time and under different circumstances, after.

Q. You have said that they fought the viaduct because they wanted the street closed, and wanted to keep you from coming up the street?

Q. But they said distinctly to the commissioner that if the street would be closed, you could come up the street, and that was the

way to do it?

A. I don't know how that was to the commissioner, but they said to this company-I will admit they said to this company, if this company would close the street-how good that proposition wasthat they would not make any further objection; but that was at a different time, different circumstances.

Q. And it was finally adjusted by the railroad commissioner or-

dering you to cross their tracks at an elevation?

A. No, sir.

Q. And to give this viaduct?

A. No, sir, it was not.
Q. Is not that the order of the commissioner today?

A. You are mixing things of different kinds.

Q. I am not mixing anything. My questions are plain, which anybody can understand.

A. This has been in contest for some time.

Q. And the end of it was that the commissioner ordered you to build the structure up over their tracks—this elevated structure?

A. That is the end, when they failed at one time.

Q. And also to build a viaduct for teams as the Michigan Central insisted upon?

119 A. Well let me explain it clearly. Q. Go ahead if you want to?

A. My statement was that they endeavored to crowd this railroad out of the street.

Q. Which side did they want to crowd you on?A. They wanted to crowd us out of the street, and to destroy all this property, coming in at that time and advocating the construction of a highway viaduet, a thing which, undoubtedly, was a good thing to have there; they never showed any disposition on their part to build a highway structure until they saw it was possible to crowd this railroad out, after the location was made. The commissioner considered all those objections and all their points, taking a great deal of time over it, and he decided, finally, that we should give as much of the street as possible to them on the south side for the highway. Then the next contest was their interpretation of a certain agreement, which was, as they understood, that the depot company would close this street, and then they would not make any further objection.

Q. You have reference to another agreement. Your company and the Michigan Central Company did enter into an agreement?

A. Yes, sir.

Q. And then had a controversy as to its meaning.

A. Yes, sir. There are the two different times; at that time the Michigan Central were willing that we should go through the street if we closed it. That is the explanation-two different times.

Redirect examination by Mr. BAKER:

Q. You made this map and survey locating the line along River street?

120 A. Yes, sir.

Q. And under the law, or at any rate as a matter of fact, that route was submitted to the State railroad crossing board?

A. Yes, sir.
Q. Whether they would approve of it or not?
A. Yes, sir.

Q. And when that was before the State railroad crossing board the question came up whether there should not be a viaduct for teams put in there?

A. Yes, sir.

Q. And the Michigan Central objected to the approving of the route because it would interfere with the building of a viaduct for teams in the street?

A. Yes, sir.

Q. And insisted that this railroad, the union depot railroad, should go on the north side of the street or onto the private property, so as to leave room enough there for a viaduct in the street?

A. Yes, sir.

Q. And without going on the property of the Michigan Central; they didn't want you to go on the property of the Michigan Ceutral?

A. No, sir.

Q. But finally the commissioner approved of the route along River street?

A. Yes, sir.

Q. And ordered the two companies to put in a viaduct?

A. Yes, sir.

Q. Reserving the right to approve of the plan?

A. Yes, sir.

Q. And when the plans were submitted he approved of the plan by which the elevated road goes along by the paved portion 121 of the street, overhead of the paved portion of the street, and the viaduct for teams is on the south side of it?

Q. So that the Michigan Central land is taken by virtue of his authority, and not by anything that the union depot company did? A. Yes, sir.

A JUROR: How will the switches be operated?

A. That is a matter of operation. I should suppose they would

be operated automatically, which is the most approved method of handling switches, to keep men off this structure. The freight yards of the principal railroads of the country now, the depot yards especially, the passenger yards, are operated without any switchmen; they are operated from a signal tower with a system of interlocking switches, so that one man controls the movements of all the trains, with not a man handling a switch. All the trains going into the Grand Central depot in New York are handled that way, and on the Boston & Albany; they are much more reliable than any human action can be; the switch cannot be wrong if the signal is right; it is mechanical; but a man can wave his hand when his switch is wrong; that is a matter of operation.

Q. You provide your elevated road with lights?

A. The top of it; I don't know that that would be necessary in the city. We are obliged under the ordinance to furnish light wherever it is necessary. I think the ordinance requires that the

way shall be lighted if it is necessary. That is in the ordinance. Another Jukon: Whether there will be used locomotives

of ninety or a hundred tons?

A. There are no locomotives of that weight on any of the railroads that are going to use that structure, but engineers now are providing in the construction of all bridges for heavier weights. We do not know when they will come upon them; but there are no locomotives of that weight upon any of these roads. The Pennsylvania Central has freight locomotives upon their mountain divisions, where they have heavy grades, but there will be no long freight trains coming up into these depot yards.

Mr. BAKER: What is the average weight of locomotives used now

for passenger trains and ordinary freight trains?

A. For our express trains our lines use a heavy locomotive; our passenger locomotives in use now will weigh possibly some 50 tons and some 60 tons; those are very heavy locomotives.

Q. Are there any locomotives in use here now that weigh 105

tons?

A. No, sir.

Q. But there are such heavy locomotives in existence?

A. Yes, sir; that is the heavy weight for the Pennsylvania road, where they go up in the mountains with heavy trains.

Recross-examination by Mr. Dickinson:

Q. You are familiar with the heavy locomotives of the Canadian Pacific?

A. No, sir.

Q. You don't know anything about the standard size of the Canadian Pacific locomotive?

A. No, sir; I don't know the standard size of the freight locomotive, but none of their locomotives will be used on this structurethey will be across the river.

123Mr. Baker: Why will they not be? Their railroad terminates on the other side, and the cars would be brought across and handled by a switch-engine on this side?

A. I don't think their locomotives would cross the river.

Mr. Dickinson: You don't think so?

A. I don't think so. I never saw one crossing the river.

Q. We don't want guess-work, Mr. Ellis. Mr. Baker: Are you guessing, Mr. Ellis?

A. I am not. I have never seen one and never heard of one, and I have spent a good part of the last ten years in observing traffic on the old depot grounds. I have constructed both slips down there and had occasion to notice the operation, and I never saw a locomotive on those ferry-boats.

Mr. Dickinson: Do they propose to keep locomotives on this side?

A. The Wabash handle their trains now, and it would be presumable that the Wabash or some other road would handle their trains here much more economically than they could keep locomotives themselves, and if they did it themselves they would have it specially for that purpose.

Mr. BAKER: They would not be moving their locomotives back-

wards and forwards?

A. No, sir.

Mr. Dickinson: They propose to run their trains into the union depot here?

A. Yes, sir.

Mr. Baker: Does the Michigan Central send their locomotives across with their trains that leave for New York?

A. I never saw one.

124 Frank H. Mackintosh, sworn in behalf of petitioner.

Examined by Mr. BAKER:

Q. Where do you reside? A. New York.

Q. What is your business?

A. A lawyer.

Q. How long have you lived in New York?

A. Very nearly two and a half years.

Q. Have you had, during those two and a half years, any business connection with the elevated roads in New York?

A. Yes, sir.

Q. What has been that connection?

A. I was in the office of their attorneys. Q. Who are their attorneys?

A. Davies, Short & Townsend.

Q. How many elevated railroad companies are there in New York now?

A. There are three, all told; a suburban and three in the city.
Q. What are the main elevated roads; what company do they belong to?

A. They are all under the Manhattan Railway Company.

Q. And the Manhattan Railway Company is the client of Davies, Short & Townsend?

A. Yes, sir.

Q. What was your position and duties in their office?

A. Settling the cases or claims of owners of abutting property. Q. How long have the elevated roads been built in New York?

A. In anything like their present shape since about 1876; 125 from 1876 to 1879 they were constructed.

Q. Will you state whether or not the companies that constructed those roads were compelled to pay the property owners in the first instance?

A. No, sir. Q. Why?

A. Because they had the authority from the legislature and from the city, and they were advised that that was as far as their liability extended; that they were not under liability for damages to the abutting owners; that this use of the street was the same as any other use of the street.

Q. Did that question finally go to the court of appeals?

A. It did.

Q. In the meantime did the companies go on and construct the elevated railroads?

A. Yes, sir.

Q. And the court of appeals subsequently held that the propertyowners were entitled to damages?

A. Yes, sir.
Q. Have the property-owners all been settled with since then?

A. Oh, no.

Q. About how many cases have there been in court? A. Between two and three thousand; about 2,500, I guess.

Q. That have been disposed of?

A. No, sir; there have been about 400 judgments and awards, and then there have been some eight or ten hundred appraisals disposed of by payment.

Q. How many suits are pending now?

A. About 2,200.

126 Q. So there are a large number of property-owners that have not brought suits yet, I suppose?

A. A great many: there must be 10,000 that have not brought suits.

Q. How long is it since this decision or opinion was delivered in the court of appeals?

A. I think it was in 1884, or 1885 or '86; in the neighborhood of

1885 the Story case was decided.

Q. So that for five years since then there are some 10,000 propertyowners that have not commenced suit?

A. At least there are 10,000 pieces of property on which no suit has been begun.

Q. How many miles of elevated road are there in New York?

A. Between 35 and 40; about 40.

Q. About what is the height ordinarily of the elevated roads in New York in the clear above the payement?

A. Well, with the exception of short spaces, it is about 15 feet. There are places where it is only about 12, and there are places where it is 54 or 55.

Q. Where it is very high?
A. Yes, sir; but those are only for short distances.
Q. Will you state whether or not the traffic goes right on under these elevated roads?

A. Yes, sir.

Q. Low are they supported?

A. By iron columns.

Q. Sometimes the post is on the curb?

- A. Sometimes on the curb and sometimes in the center of the street; in all the streets it is, I think, on the curb; on all the avenues I think it is 18 feet from the curb.
 - Q. Are the streets and avenues down there of different widths?
- A. Yes, sir; the avenues are 100 feet, I think; the streets 127 vary.

Q. Wider than that?

A. All narrower than that, except there are ten or twelve streets uptown, Fifty-seventh and Eighty-sixth, and every tenth street above that, I think, are 100-feet streets.

Q. Does the elevated road run in front of a great deal of business

and manufacturing property?

A. Yes, sir, all kinds of property practically.

Q. And residence property?

A. Yes, sir. Q. You say that you had to do with the settlement of cases with property-owners?

A. Yes, sir, both for and against them.

Q. So that you are familiar with the subject?

A. Yes, sir.

Q. About how many tracks do the elevated roads usually have

in the streets of New York?

- A. There are two as a general thing. There are places where there are four and places where there are three, but the greater part of the road is a two-track road.
- Q. Have you heard the claims of property-owners as to how they were damaged?

A. Yes, sir.

Q. Have you assisted in trying cases of that kind?

A. Yes, sir, both for and against them.

Q. Are the trains on the elevated roads operated with locomotives?

A. Yes, sir.

Q. What kind of coal do they use?

A. Anthracite.

Q. What is the weight of the engines?

A. They are about 23 tons, I understand; I don't speak 128 from my own knowledge.

Q. You never weighed one of them? 10 - 55

A. No, sir; but that is the way they are rated in the company's offices.

Q. Are they in size about half the size of an ordinary locomotive?

A. About 26 or '8 feet long and about 12 feet high, and will weigh about 23½ tons, and earry about a ton of coal.

Q. How wide is the gauge of the road? A. Standard gauge, about 4 feet 8½.

Q. Just the same as the ordinary railroad?

A. Yes, sir.

Q. How often do the trains run there?

A. Every minute and ten seconds to 20 minutes apart, according to the time of day.

Q. During the business part of the day?

A. At intervals of a minute and ten seconds.

Q. When do they commence at that rate of speed?

A. About 7 in the morning, I think, to 9 or half past, something like that, during the hours when the people are going downtown in the morning and uptown at night; it may be from 7 to 10, and from about 5 to 7 or half past, something like that.

Q. How often is that?

A. A minute and 10 seconds. Of course they vary, but that is the time they are placed to follow each other.

Q. And in the night how often do they run?
A. After 1 o'clock they run every 20 minutes.

Q. Up to 1 o'clock, from 7 to 1?

A. 4 to 8 minutes.

Q. Do they run all night?

129 A. Yes, sir; they run all night, except on the South Avenue line south of Fifty-ninth street; they don't run after 1 o'clock there.

Q. But on the other lines they run continuously?

A. Yes, sir.

Q. But after 1 o'clock at night there is a train every 20 minutes?
A. Yes, sir. I think on the Second Avenue line they don't run after 1 o'clock, because they run on the Third Avenue line, which is within a block of it.

A JUROR: The elevated road which starts from Greenwich street

and goes to Harlem runs all night?

A. Yes, sir. There are two tracks north of Courtland street.

Q. How much do you say the locomotives weigh?

A. Twenty-three and a half tons. They have smokestacks and everything just the same as an average locomotive, except they are smaller.

Mr. BAKER: They are like an ordinary locomotive?

A. They do not have any bells.

Q. Have a whistle?

A. Well, but that is only blown in case of assistance.

A JURGE: You stop at every block or every other block?

A. No, sir; there are stations about four to ten blocks apart on the Greenwich Street line.

Mr. BAKER: Have you gone down and looked at the property of Absalom Backus, Jr., & Sons?

A. Yes, sir.

Q. You have heard described in court here this afternoon and heretofore just what is proposed to be built in front of it?

A. Yes, sir.

Q. And that it is proposed to operate an ordinary railroad 130 in front of that property?

A. Yes, sir.

Q. I suppose you have become very familiar, with your experience in New York, with the amount of damages that are awarded there?

A. Yes, sir.Q. With reference to the value of the property?

A. Yes, sir.

Q. And in every conceivable shape?

A. Yes, sir.

Q. Will you you tell us what, in your judgment, Mr. Backus' property will be damaged per foot front?

A. Ten dollars a foot.

Q. That you think would cover the actual damage to the property?

A. Yes, sir.

A JUROR: How do you arrive at the damages?

A. Well, I compared the property with the property in New York, and I know what we pay there and what is considered the damages, and I compared the two properties together and I inferred what the damages will be.

Mr. BAKER: Perhaps the juryman has reference more particu-

larly to how you estimate the damage.

- A. The elements that enter into the damages are the impairment of light, the impairment of access-ease of access, and smoke, and noise to some extent. Those are the principal elements that enter into it.
 - Q. You consider all those things in estimating the damages?

A. Yes, sir.

A JUROR: Is there anything on account of fire?

A. I don't consider the fire risk at all in my estimate, be-131 cause if the road is properly operated there will be no risk, and if it is not properly operated, they will be liable for whatever damages are caused.

Q. Has there not been damage from fire?

A. Not in New York.

Another Juron: Do you consider this traffic equal to any ele-

vated railroad in the city of New York?

A. I think it would be just about equivalent. There would not be so many trains, but perhaps they would be of a more damaging character. The trains would not run so often, but they would be heavier trains, and I think that your roads use bituminous coal, etc., and I think, taking it all in all, the damage would be just about the same.

Q. Are you aware how much business they will do here?

A. I only judge by the time-tables, which I have looked over coming and going. I should not suppose they would have one-twentieth the number of trains that run over the elevated roads.

Mr. BAKER: We will show just what that is.

ANOTHER JUROR: Do you use the elevated for freight?

A. They are all used simply for passengers, except a baggage.

Q. Do you know what this railroad is to be used for?
A. I understand it is to be a passenger station only.

Q. Don't you think that from the fact that it is a passenger station, people coming from all parts of the country, and compared with a street railroad, would you, according to your judgment, put the amount of damages of the same standing?

A. Oh, no.

Q. You said that according to New York, compared with New

York, it would be \$10.00?

A. I will explain that. We have not any property in New York in front of which the elevated road runs which is worth much less than \$1,000 a front foot, the land alone, and on an average the damages do not exceed \$100 per foot front. Now, this land down there in my judgment is worth \$100 a front foot, and it is in a location, and the character of the property is of an inferior character to anything in New York entirely, especially from the mere fact that if it is used, it is used away down near the river front, there is nothing but depot yards all around there, and I don't consider this use of the property inconsistent with Mr. Backus' business at all, except as it might interfere with the access and light and air, and the noise of the cars might make some trouble.

Q. At this rate he would be getting how much?

A. \$2,500.

Q. For all time?

A. Yes, sir.

Another Juron: You say you live in New York?

A. Yes, sir.

Q. How did you arrive at the conclusion that the property was worth \$100 a foot in that locality; was it from your judgment?

A. Yes, sir.

Q. I don't see how you are capable of judging what anything is worth in this town.

A. I may be wrong. If I have judged wrongly, it might affect my estimate.

Cross-examination by Mr. Dickinson:

Q. What is your age?

A. I will be 27 next Wednesday.

133 Q. And you have lived two and a half years in New York?

A. Yes, sir.

Q. Do you own any property in New York?

A. No, sir; no real estate.

Q. Have you ever been the agent of property-owners in the collection of rents in New York?

A. Yes, sir.

Q. Where do you live in New York?

A. I live at One hundred and fortieth street and Twenty-seventh street.

Q. Is there an elevated road on that street?

A. No, sir.

Q. The elevated roads in New York are used wholly for street-

car purposes?

A. Wholly for passenger business, except that one baggage car runs from Fifty-third street and Eighth avenue to connect with the New York & Northern.

Q. Just across the street from Fifty-third to Eighth avenue?

A. No, sir, it leaves Fifty-third street and Eighth avenue and goes out to Harlem and connects with the New York & Northern road.

Q. No baggage car runs downtown?

A. No, sir.

Q. And it is used only for passenger street car service?

A. Yes, sir.

Q. Give us an idea of how heavy one of those cars is compared with the cars of a trunk-line road.

A. I cannot tell you how they compare. The weight is about 15 tons when empty.

Q. And the engine is generally boxed in like a dummy?

134 A. No, sir.

Q. Have you seen the dummy engine that our street car company runs here on Jefferson avenue?

A. Yes, sir.

Q. How does it compare with that?

A. There is nothing like that on the elevated road.

Q. Do you wish to be understood as saying that the engines of

the elevated road are not inclosed in wood frames?

A. I don't think any of them are in wooden frames. Some of them are in iron frames, so that the tender and the cab are one, but there are none of them but what have smokestacks separate from the boxing, standing out away from the boxing.

Q. But is there any frame about that, either wood or iron, painted

the same color as the cars?

A. Some of the old ones are. As I say, they include the tender and the cab, and some stand up to the boiler a little ways.

Q. They burn anthracite coal?

A. Yes, sir.

Q. They are compelled to do that under the ordinance?

A. I don't know as to that.

Q. Do you know what locomotives in this part of the country burn usually?

A. From seeing an advertisement, I conclude that the Lackawanna is the only one that uses hard coal.

Q. Do you know whether there is more cinders, smoke and fire from bituminous or anthracite?

A. I know there is some smoke; I don't know anything about cinders. I suppose there would not be any difference about that, I don't know; more smoke from bituminous.

Q. What hotel are you stopping at? 135

A. The Cadillac.

Q. Do you know the Russell house?

A. Yes, sir.

Q. Did you notice the furnishing store below there of Mabley & Company, extending down there-hats and caps, boots and shoes, clothing-next below the Russell house, at the left as you stand in front of the Russell house?

A. Yes, sir.

Q. What would you say would be the damage to that to put an elevated road, over which would run four or five great lines of standard-gauge track, three standard-gauge standard tracks, over which freight and passengers would be carried, pulled by locomotives, as on the great trunk lines of the country-what damage per foot would it be to Mabley's?

A. Where would the line run, right along Woodward avenue? Q. Yes, right on, from within 15 to 40 feet of their front, from the store itself, what would be the damage per foot front?

A. That is a dry-goods store, is it not?

Q. It is furnishing goods, shirts, etc. Do you take into estimation the business in estimating the front-foot damage?

A. Yes, sir, I do.

Q. How much per front foot would you estimate it if it was a shirt store, Mabley's?

A. It would depend upon whether it was 15 or 30 feet.

Q. Suppose it was a shirt store; suppose there was an elevated structure running by there, three tracks, over which the great trunk lines would run?

A. How far from the front of the building?

136 Q. Fifteen to 20 feet.

A. It would make a great difference whether it was 15 or 40 feet.

Q. Well, say 20 feet?
A. I should think perhaps it would be damaged from \$100 to \$150 a foot front.

Q. If it was a shirt store?

A. Yes, sir. Q. What if it was a clothing store? A. It would not make any difference.

Q. Would boots and shoes make any difference?

A. I don't think so. The road would probably change the character of the business down there.

Q. You know the store?

A. I have seen it.

Q. You give an estimate of the value of their real estate here. What is the value of that real estate per foot front?

A. You mean with the buildings on it?

Q. Give the real estate; never mind the buildings.

A. Assuming that was a vacant lot, and the others around it?

Q. Yes.

A. I should think it would be worth \$400 per front foot.

Q. You are a great deal out of the way. You say a large number of property-owners have not sued the Manhattan road?

A. Yes, sir.

(). Do you know of any one getting a judgment against the Manhattan road that they are unable to collect?

A. What do you mean by unable to collect?

Q. Unable to get their money after they have got a judgment.

137 A. No, sir, I don't.

Q. Who is the president of the Manhattan road?

A. Jay Gould.

Q. What is the amount of the mortgage on the Manhattan road?

A. Forty millions of dollars.

Q. And the judgments sought to be collected are against the Manhattan corporation, are they not?

A. They generally run against them, and one or the other of the

companies.

Q. They don't run against the bondholders or the mortgagees?

A. No, sir.

Q. So that when you get a judgment and seek to levy, the bondholders object?

A. I never knew them to object. I never knew a judgment that was affirmed by the court of appeals that was not paid within three days after it was affirmed.

Q. Are you familiar with all the business?

A. I am familiar with the payment of every judgment the last three years.

Q. But there is a forty-million debt on that property, and a mortgage on it all?

A. Yes, sir.

Q. And any man that levies upon it levies subject to the fortymillion-dollar mortgage?

I suppose he does.

Q. Has that occurred to you as any reason why men have not sued; has that been any reason?

A. I presume it has.

Q. Had anything to do with the settlements you have made?

A. I never heard of that point being raised.

138 Q. Did you ever hear the point raised that they could not collect?

A. No, sir.

Q. You have been there in New York two and a half years? A. Yes, sir.

Q. And you have represented suits against the company?

A. Yes, sir, and I have got 25 of them now.

Q. You have got 25 suits against the company now?

A. Yes, sir; I am by myself now.

Q. And you were a clerk in the office of Davies, Short & Tow send?

A. Yes, sir.

Q. Are you now?

A. No, sir.

Q. Have you left the office since you were here the last trial?

Q. And you have now taken suits against the company?

Q. When you were here before you had been in the employ the company, and you had been away from that office for about to weeks once?

A. Yes, sir.

Q. And in the meantime you had a suit against the company as against that office?

A. I had a claim and settled it.

Q. One of these claims, and settled it, for a client, and you the returned to the employ of the company two weeks afterwards?

A. Yes, sir.

139 Q. Let us understand it clearly. You took a retainer fro a citizen who had a claim for damages against the compan and went out of that office and out of the employ of the compan

for taking that claim; is that right?

A. No, sir. I will explain the facts. There was a question salary between Davies, Short & Townsend and myself, and I retire from the office, and after I retired from the office a man came to n with a claim against the company, and after I went back to the office I informed them-afterwards I agreed to go back on an a vanced salary, and after I had gone back I informed them of the claim being placed in my hands, and that I thought I could sett for so much; and I told this man then they would give so muc and they agreed to it, and that was the end of it.

Q. What was your man's name?

A. Whitecar—it was a woman who owned the property. H real-estate agent was the man I saw.

Q. Which did you represent, the agent or the woman?

A. I never saw the woman.

Q. But you knew you represented the woman?

A. I didn't represent her exactly.

Q. How long a time were you out of the employment of the con pany before you went back at an increased salary?

A. About two weeks.

Q. Then you went back at an increased salary and settled th woman's claim against the company, after you went back in the office?

A. Yes, sir.

Q. And you never saw the woman?

A. I never saw the woman.

Q. Will you give us her name?
A. Margaret Whitecar.

Q. And now you are out of the employ of the company 140 again?

A. Yes, sir.

Q. How long have you been?

A. Since the first of April; I think about the 6th of April.

Q. In forming your judgment of the damage to the Backus property, you take nothing into consideration, do you, except your experience in the elevated-road business in New York?

A. Well, I went down there and looked the property over.

Q. You used your experience to determine?

A. Certainly.

(). You estimate it about as you would if the elevated roads were running by as in New York, and similar kind of property?

A. No, sir.

Q. You have had no experience in adjusting claims to property by which runs the ordinary lines of the great railroads?

A No. sir.

Q. You don't pretend to? A. No, sir.

Q. So that all the experience you have had has been with the New York elevated passenger roads?

A. Certainly.

Q. And property there?

A. Yes, sir.

Q. Do you know anything about the planing-mill business?

A. No, sir. 141

Q. Were you ever in one? A. In a regular mill like Mr. Backus'?

Q. Yes.

A. I don't know the exact character of his, but I have been in places where all sorts of interior wood-work, etc., were done.

Q. Do you know anything about such planing mills as Backus'; were you ever in one?

A. Not exactly that kind that I know of. Q. Have you ever been through that?

A. No, sir.

Q. You have not even been inside?

A. No, sir.

Q. And you estimate your damage at \$10 a foot without looking at the property or seeing what kind of property it was?

A. No, sir; I have been down there twice or three times and looked the property all over.

Q. Do you know where the dust-room is?

A. No, sir.

Q. Do you know anything about the nature of a dust-room in a planing mill?

A. No, sir.

Q. Do you know that a lighted pipe or a spark would ignite it as it would powder?

A. No, sir. As I have already testified, I didn't take any fire risk into consideration.

Q. Were you ever in a flouring mill? A. Yes, sir.

Q. Did you ever know anything about the readiness with which dust will ignite, from wheat or wood?

A. I have been in a flouring mill.

142 Q. Did you know anything about the nature of the dust that accumulates in a flouring mill?

A. No, sir; but I know it does accumulate.

Q. And about its highly inflammable character?

A. No, sir.

Q. Did you know that the dust in a planing mill was more highly inflammable than wheat dust?

A. No, sir; I didn't know anything about it.

A JUROR: In giving the amount of damages to be fixed or settled. don't you think the amount of business done by the men that you award damages to has a little to do with it in settling the damages?

A. I didn't think this will interfere with Mr. Backus' business.

Q. That is not my question.

A. I don't consider that Mr. Backus' business is going to be in-

jured at all.

Q. My question is whether, according to your judgment, the amount of business that a man does has got something to do with the amount to be given him as damages?

A. Yes, sir; it would naturally. Every element must be taken

into consideration.

Q. If there was a candy store next door, would you allow as much

damages to that candy store?

A. I estimate my damages per foot front, and if there was a candy store on the same land, and right out on the street, I should consider that property more damages than Mr. Backus'; I don't mean more in the gross, but more per foot front.

Another Juron: Do you know how much business Mr. Backus

does?

A. No, sir; I suppose a very large business.

143 Mr. BAKER: He does not pretend to know. He says that he does not consider that the road would affect his business, and therefore he does not estimate his damage on that; the property would be damaged ten dollars a foot.

A JUROR: If you think in your opinion it will damage his business nothing at all, why should he be entitled to ten dollars a foot,

if it is no damage to him?

A. It won't interfere with his business. I have no doubt that Mr. Backus will make just as much money after that, and do just as much business, but it will not be quite so easy to transact that business there; there will be posts in front of his property, and those posts might interfere with it, and you cannot turn loaded lumber wagons around there as well as where there are no posts or obstructions, and these things damage it to some extent.

Questions by Judge CHIPMAN:

Q. You say you have never been in Mr. Backus' mill?

A. No, sir.

Q. Were you ever in a planing mill in your life?

A. I have been where they plane.

Q. Were you ever in a regular planing mill in your life, such as we have in this western country?

A. I don't suppose I have been through such as you have out

here.

Q. Do you know how big an establishment it is or how large a business it does—do you know anything about that?

A. I don't. I don't consider the business will be damaged a

particle.

- Q. If you don't know anything about this business, how can you tell this jury in this flat-footed manner that it cannot be damaged?
- Mr. Baker: I want to take an objection. He is testifying upon the physical effects of that property.

Q. If you don't know anything about the business, how can you

tell this jury that it cannot be damaged?

- A. From the general nature of the lumber business I conclude that he cannot be damaged from it, except in the ways I have stated.
- Q. But this is not a lumber business—this is a planing mill and box factory, scroll-work.

A. I understand all that.

Q. You understand its business operation, do you?

- A. I heard the details here of all the kinds of business that Mr. Backus does. Mr. Dickinson asked me that when I was here before.
- Q. Are you giving an estimate of the damage done to the business based on your knowledge of the business?

A. Yes, what I know about it. Q. What do you know about it?

- A. I know they transact a general lumber business there and make all sorts of finished work, panels, sashes and one thing and another.
 - Q. What do you mean by a general lumber business?

A. General fine interior and exterior wood-work.

Q. You don't mean that they buy and sell lumber there—a lumber yard?

A. I understand their lumber yards are elsewhere.

Q. You don't even know that there is what is called a dust-room in a factory of that kind?

A. I don't.

145

Q. You don't know the nature of that dust?

- A. No, sir; if I did it would not make any difference, for I don't take that into consideration.
 - Q. I don't believe it would make any difference?

A. No, sir.

Q. Are you aware that a spark will blow up that dust?

A. I am, and I am aware that if it does and the railroad come pany have been negligent, you will have your remedy; otherwise

you will have no remedy.

Q. Your idea of the law of this case is that we are to be damaged or take the great risk of damage and of being blown up, and to take the chances of the railroad company paying us by and by if it happens—is that it?

A. Yes, sir. If the road is properly operated, you will have no

damage.

Q. You say you are a lawyer? A. Yes, sir.

Q. Do you mean, here, to say, as a lawyer, that the risk of fire from an improvement of this kind is not an element of damage in this case?

A. Yes, sir.

Q. To be considered?

A. Yes, sir. Q. You so testify?

A. I do.

Q. Where did you get that law from?
A. I am not here to explain my sources of information; I simply say that the fire risk is not to be taken into consideration, for the reason I stated.

Q. I have some curiosity and would like to know where you get

the law.

A. The question of fire risk has never been raised that I am aware of in any case in New York city; it may have been, but I am not aware of it; and I never knew of a cent of damages being awarded for fire risk.

Q. Do you know of any case where a planing-mill prop-146 erty was attacked between these corporations as this is here?

Objected to as wholly immaterial.

Q. Do you know of a single instance of a mill like this?

A. Not exactly of this kind.

Q. They don't have many of them in New York?

A. No, sir.

Q Are you aware that this establishment ships enormously to New York, and supplies, very greatly, your market?

A. Very likely.

Q. So that, in estimating the damage, you exclude this idea of any risk from fire entirely?

A. I do. If there is any risk and you are entitled to it, I should

state the damages higher.

Q. Now, in regard to light. Do you know how much light is needed to carry on that business?

A. What do you mean by how much?

Q. Do you know how much?

A. I know there must be light enough to see your work, and especially if it has fine carving work to be done.

Q. Do you know whether this requires a great deal of light?

A. I presume so; but your light for fine work cannot be interfered with by that structure without you change your buildings.

Q. Now you base your ideas entirely by those railroads in New

York ?

A. I have so testified three times.

O. You consider that those roads do not interfere with the light in New York?

147 A. They do interfere with the light; that is what I have said I estimate as an element here.

Q. Do you consider that those roads do not interfere with business in New York?

A. They do on some streets.

Q. Those are the streets where there is business?

Q. What streets do they interfere with business on, if not streets where the business is?

A. Mostly on streets where there are cheap retail stores, and so forth.

Q. What do you call a cheap retail store street?

A. Division street.

Q. What do you call Sixth avenue?

A. I call that a dry-goods district; the largest stores, practically, in New York are in that street.

Q. Do you call that a cheap retail store street?

A. No, sir. That practically is not damaged, and the railroad company has recovered judgments on that very street.

Q. You say the property is not damaged on Sixth avenue in New

York by these structures running on that street?

A. No, sir; it is quite a benefit. Q. How about Twenty-third street?

A. It is not damaged one cent, but vastly increased.

Q. Has not the theory of your companies, or at least those companies, been that they do not damage property anywhere?

A. No, sir. The theory has been that they were not liable until

they were found liable.

Q. But they have been obliged to pay damages?

A. Yes, sir. Q. Why?

148

A. Because they did damage. In some cases they have

been compelled to pay where they did not, too.

Q. In regard to this Backus property, do you consider that a locomotive, passing in front of a factory so close as this is to the track of this proposed improvement or proposed structure-do you consider that a locomotive passing up opposite the open windows of a factory of that kind does no damage?

A. I consider that it does some damage.

Q. Your impression is that the damage is ten dollars a foot?

A. I so testified.

Q. What part of the building do you consider the ten dollars a foot is to, the lower or upper part?

(No answer.)

A JUROR: Did you say ten per cent.?

A. No, sir; the average in New York on the value of the property, of damages awarded, has been less than seven per cent.

Mr. BAKER: On the total value?

A. Yes, sir.

Judge Chipman: What part of that property do you consider is damaged ten dollars a foot?

Objected to as immaterial.

A. I consider that it is all damaged.

Q. The whole of it?

A. Yes, sir.

Q. From the ground up to the angle of the roof?

A. I consider that that property is worth ten dollars a front foot less with that road here than without it.

Q. Would you not say that it is worth twelve dollars a foot less?

149 A. No. sir.

Q. Would you not say nine dollars a foot less?

A. No, sir.

Q. Ten dollars, and no more nor less?

A. No, sir.

Q. Suppose the mills were off there entirely and there was no factory?

A. Then I should consider its damages less-probably about five

dollars a foot.

Q. Now, will you please tell the jury what property is worth a foot front down there?

A. \$100.

Q. How do you know?
A. That is my judgment.

Q. How come you to have any judgment; how do you form any judgment?

A. Because I have some reason and some sense.

A JUROR: What is the value of the buildings and machinery?

Q. Do you know what the value of that plant is?

A. I am not familiar with that.

Q. Do you know what the vibration of locomotives, trains moving there, what effect that will have upon the plant?

A. I don't think that will cause any.

Q. Do you know anything about the character of the plant?

A. I have seen the buildings.

Q. But do you know anything about the delicacy of the machinery; do you know how expensive it is?

A. No, sir.

Q. Have you any idea of the difficulty of adjusting that machinery?

A. I don't know; I don't take that as a condition, because I don't think there will be a particle of jar there if the road is properly constructed.

Q. You say the value of the property is \$100 a foot there?

A. I think so.

Q. I want you to explain to this jury how you, a stranger in this city, can come here and give any estimate of the value of the property, how you attempt to do it?

A. I have nothing to explain. That is my judgment of what

the property is worth there.

Q. Do you think you have any judgment on that subject at all?

A. I do.

Q. Do you think you have any knowledge that will justify you in making a judgment?

A. You asked me to give my opinion, and I have given it.

Q. You are not giving your opinion. You are giving evidence as an expert here.

A. I am not giving my estimate of the value of the property

there as an expert.

Q. You say you consider that property worth \$100 a foot front?

A. Yes, sir.

Q. And on that basis you consider the damage \$10 a foot?

A. Yes, sir.

Q. Now, do you know what any property has sold for in that neighborhood? 151

A. No, sir.

Q. Are you aware that property has sold immediately in that neighborhood for \$400 a foot?

A. No, sir.

Q. You didn't inquire about that?

A. No, sir.

Q. Well, then, you judge of the value of the property by the looks of it, is that it?

A. Yes, sir.

Q. You judge the value of the Mabley property, by the Russell iouse there, to be about \$400 a foot?

A. That is what I said; of course I don't know what the depth of

he building is there.

Q. You gave your idea of the value of that property; say it is 00 feet deep?

A. I should say that is the value, but I don't know.

Q. What would you say if it was worth \$3,000 a foot front there?

A. Then I should say it was worth that.

Q. Now, I will ask you, and I ask you, meaning to be entirely air and polite to you as a young man, how is it that you can come rom another city here, in a town entirely strange to you, and underake to tell this jury the value of property here; what do you do it or?

Objected to on the ground that the witness does not undertake to o anything of the kind.

A. If I come out here and look at a piece of property, I should now whether it is worth ten cents or ten thousand dollars, somewheres near, and I have been down and looked at that property, and my judgment is that it is worth, \$100 a foot. If it is worth more than \$100 a foot, then the damages might be more; so if my judgment is not right the jury can take that into considera-

tion.

Q. Do you know what the Fort Street front of that property is worth?

A. I do not.

Q. Do you know what property two blocks above there is worth?

A. I should not suppose it would vary much. It may be in-

creased a little bit as you come up this way; I should presume it

would.

Q. Do you know what the value and selling price of any property within five blocks of that place, in any direction, is?

A. I don't know the value of any property in Michigan.

Q. How long were you here before you fixed a value on that property?

A. One day.

Q. You did it in one day?

A. Yes, sir.

Q. And you have lived in New York only a little while, two and a half years?

A. Yes, sir.

A JUROR: Did you consult anybody on the value of property in this city?

A. I didn't.

Q. This is only your own judgment?

A. That is all.

Q. Have you had any experience in the real-estate business before?

A. No, sir. Q. None at all?

A. No, sir. Of course I know the value of real estate in New York.

Mr. Baker: You don't undertake to tell the value of property here?

A. No, sir; I say assuming that that property is worth \$100 a foot front, I should say the damage is \$10 a foot; if the property is worth \$200 per foot front the damages would be more.

Judge Chipman: You took it at ten per cent.?

A. No, sir, I don't definitely.

Q. Have you ever conducted a steam railway, that is, a passenger railway, aside from an elevated road?

A. I never conducted any.

Q. Have you been interested as president, stockholder, or anything of that kind in any of these great trunk lines?

A. No, sir.

Q. You never have had anything to do with them?

A. No, sir.

Q. Do you know anything about the machinery of running them, the manner in which they are run?

A. I don't know any more about it than what other people know.

Q. Do you know the weight of a large locomotive?

A. I know they vary from about 40 to 60 tons, ordinary locomotives.

Q. Do you know the weight of passenger cars?

A. I don't.

Q. Do you know the average number of cars in a train?

A. No, sir.

Q. Do you know the fact that there was also to be a freight depot here?

A. I don't understand there is to be any this side of Mr. Backus'

property.

Q. Did you understand that there was to be a freight depot on the land right up alongside of the passenger depot, on the new passenger depot grounds?

A. No, sir, I understand that there was by the original plan, but

that has been abandoned.

Q. Suppose it is not abandoned?

A. Assuming there are going to be freight trains running by there, I should say it would increase the damages. Assuming they are going to use this for freight purposes, as well as passenger purposes, there would be so many more trains and heavier locomotives, that would increase the damages.

Q. Suppose there are a lot of switches right in around Mr. Backus'

property?

A. More than shown by the plan?

Q. The plan shows a lot of switches there.

A. It only shows there are two tracks part way and three tracks the rest.

Q. And the kind of interlock there?

A. Yes, sir.

Q. I suppose they have got to have some switches?

A. I presume very likely.

Q. Suppose there are a lot of switches there?

A. I have taken that into consideration.

Q. How many trains do you allow for being switched there per day and night?

A. I don't allow any particular number of trains.

Q. How many cars do you allow for running over there day and night?

A. No particular number. I assume that the ordinary passenger traffic of a union station will be carried on.

Q. What is your idea of the ordinary passenger traffic of a union station?

155 A. In Detroit?

Q. Any place.
A. I should suppose there might be perhaps 15 or 20 trains in and out a day.

Q. Suppose there was 40, 50, 60 or 100 in and out a day?

A. That might make some difference in the damages.

12 - 55

Q. Would it make any difference? A. Certainly.

Q. You think it would? A. Yes, sir.

Q. How much difference?

A. If the traffic is doubled the damage might be raised a small

percentage.

Q. Give us some idea, because we are very anxious to get your views upon the subject. About what percentage would you raise it, suppose instead of having 15 or 20 trains a day there were 100, what percentage would you give Mr. Backus?

A. I don't think a hundred is a number that is possible to suppose. I don't think there can be 100 trains arriving and departing

from that depot.

Q. Do you know how many trains arrive and depart from the Michigan Central depot in a day?

A. No, sir.

Q. Do you know how many companies are going into this union

depot?

- A. I understand there are three or four—the Canadian Pacific, the Wabash, the Flint & Pere Marquette, and the Detroit, Lansing & Northern, I understand.
- Q. And you think, then, that those people are all going into this great expense and improvement with no possibility of those 156 four companies having 100 passenger trains a day going in there?

A. I do, most assuredly.

Q. How many passenger trains a day do you think go into the Grand Central depot in New York?

A. I don't know.

Q. How many do you suppose go into the Grand Central depot in St. Louis.

A. I never was there.

Q. Have you any idea how many go into Chicago?

A. No, sir.

Q. You have no idea on the subject at all?

A. No, sir.

A JUROR: Then how come you to come here and say how much are the damages if you don't know the number of cars and trains coming in and out?

A. I have said I assumed from 10 to 15 passenger trains a day

will arrive at and depart from this station.

Judge CHIPMAN: This firm you have been with so long, and the firm you were with when you first came here, were the attorneys of the Manhattan system of railways in New York?

A. Yes, sir.

Q. Of which Mr. Gould is the president?

A. Yes, sir.

Q. Mr. Gould is also president of the Wabash system here?

A. I don't know.

Q. You would be a little surprised to hear it, would you not?

A. I should not be surprised to hear anything of that kind.

Q. Well he is.

Mr. Baker: I guess you are mistaken about that.

Redirect by Mr. BAKER:

Q. You don't pretend to fix real-estate values?

A. No, sir.

Q. You might say that you estimated the damages to this property upon the theory that that property down there was worth \$100 a foot?

A. The land, yes, sir.

Q. You think that Mabley's property over here would be worth \$400 a foot?

A. I think so.

Q. Could you tell us how you could be so far away on the value of that property and so close on the value of the property down there at Backus'?

A. I don't know, unless I have not a proper appreciation of the

value of your retail business property.

Mr. Dickinson: He is not near it in the value of the Backus property.

Mr. BAKER: We will show that property is not worth over \$100

a foot, or about that.

Q. You have had this experience with the elevated roads in New York?

A. Yes, sir.

Q. And you tell us that the average damage in the city of New York that the property-owners collected, after they have had 15 years' experience with the road, does not exceed 7 per cent. of the total value of the property?

A. Yes, sir.

Q. And those roads have been in operation 15 years?

A. Yes, sir.

Q. So that the property-owners can come forward and prove every particle of damage that is done?

A. Yes, sir. That represents over 365 judgments and awards.

Q. That you have had to do with yourself?

A. Yes, sir, that I have kept the record and know about.

- Q. Over 365 judgments and awards that you know about yourself?
 - A. Yes, sir.

Witness is shown photographs.

Q. These photographs show parts of the elevated road in New York?

A. Yes, sir.

Mr. Baker: It is not necessary to identify the different streets, is it?

Mr. Dickinson: The streets are all marked. I will take them without his testifying as to that.

WITNESS: They are all marked to be put in as exhibits there, I

think, every one.

Mr. Dickinson: We will consider them in evidence. Mr. Dickinson: You brought these photographs?

A. Yes, sir.

It is arranged that the jury shall go to examine the premises of Backus & Co., on Friday afternoon, June 12.

159 Adjourned to next day. Monday, June 15, 1891—2 p. m.

Tuesday, June 16, 1891-2 p. m.

Mr. Greiner, a juror, was still sick, but counsel said they would go on with the testimony, which could be transcribed and Mr.

Greiner could read it.

Mr. Baker: I introduced in evidence the map and survey of the Fort Street Union Depot Company, with the approval indorsed on it of the State railroad crossing board, and in that connection I desire to read in evidence the order entered by the board upon its record at Lansing.

Mr. Dickinson: We will take an objection to that as entirely immaterial. You may go on and read it, subject to the objection.

Mr. Baker then reads the order, as follows:

"STATE OF MICHIGAN:

Before the board of railroad crossings.

In the Matter of the Approval of the Fort Street Union Depot Company's Proposed Route in the City of Detroit.

DETROIT, MICH., Nov. 8, 1889.

At a meeting of the board of railroad crossings, held at the Rus-

sell house, pursuant to adjournment,

Present: Hon. John T. Rich, commissioner of railroads; Hon. Gilbert R. Osmun, secretary of state; Hon. S. V. R. Trowbridge, attorney general, members composing the board.

In the matter of the application of the Fort Street Union Depot Company for the approval of the map of its proposed line of railroad tracks, between Twelfth and Third streets, in the city of

160 Detroit, county of Wayne, with a crossing of the several tracks of the Michigan Central railroad, in Woodbridge street, near the intersection of Eleventh street, said application now coming up for further hearing of the board, Mr. James F. Joy and Fred. A. Baker, duly appointed and authorized in such behalf, appeared as attorneys for the said The Fort Street Union Depot Company, and Mr. Ashley Pond and Henry Russel as attorneys for and in behalf of the said Michigan Central Railroad Company.

Whereupon the board, having listened to the arguments of the

counsel, and to the statement of the engineers employed by each of the said parties in interest respectively, and to the statements of all other parties appearing before the board and desiring to be heard, and being otherwise fully advised and informed, and having first considered all and singular the premises, on motion of Mr. Osmun, seconded by Mr. Trowbridge, the said map and the said line of railroad as designated and located thereon, were duly approved by the board, and the signature of such approval over the proper signatures of the members of the board duly indorsed on said map.

And it was further determined and ordered by the board with regard to the crossing of the tracks of the Michigan Central railroad in Woodbridge street near the intersection of Eleventh, and that the tracks of the said Fort Street Union Depot Company shall go above those of the Michigan Central railroad at an elevation of at least 18 feet in the clear between the upper surface of the head of the rails in the Michigan Central tracks and the under surface of the girders in the superstructure of the said union depot company's bridge.

And the said superstructure shall be so constructed on River street as to provide a passageway for teams and foot travelers, and in accordance with plans and specifications to be first

submitted to and approved by the commissioner of railroads.

The cost of the part of the superstructure for the passage of teams and foot travelers, and of the approaches thereto, shall be borne by the two companies in interest, in equal proportions, share and share alike.

JOHN T. RICH, Chairman of the Board.

Attest: W. C. RANSOM, Clerk of the Board."

161

Mr. Baker: That shows the action of the State railroad crossing board in approving the map and survey of the Fort Street Union Depot Company, and that action was taken under section 17 of the general railroad law, which authorized the State railroad crossing board to determine the manner and the place where a new proposed railroad is to cross an old railroad. Some question arose as to the authority of the State railroad crossing board to enter up an order for a viaduct for teams and foot travelers, and subsequently the commissioner of railroads, in his separate individual capacity, granted an additional order, which is dated April 30, 1890, and I will read that order.

Mr. Dickinson: I make the same objection, as immaterial.

Mr. Baker then read the additional order dated April 30, 1890, as follows:

162 "THE STATE OF MICHIGAN:

OFFICE OF THE COMMISSIONER OF RAILROADS.

To the Fort Street Union Depot Company and the Michigan Central Railroad Company:

Whereas, in the judgment of the undersigned commissioner of railroads in and for the said State of Michigan as aforesaid, the construction of the proposed viaduct of the said Fort Street Union Depot Company along the line of River street, in the city of Detroit, in the interest of the public safety, and that of the employes on your respective roads, will necessitate the construction of an overhead passageway for the use of teams and footmen at the crossing of the Michigan Central tracks in said River street near Tenth, therefore, by virtue of the authority in me vested, as commissioner of railroads as aforesaid, by the provisions of section 17 of act No. 79 of the Session Laws of 1873, and the several acts amendatory thereof, it is hereby ordered and directed that in the construction of the said Fort Street union depot viaduct along the line of River street, as proposed by the said company, the posts or supports of the said viaduct east of the Michigan Central tracks, upon the south side of said viaduct, shall be set so as to conform in alignment with those upon the south side of the viaduct and west of the Michigan Central tracks.

There shall be constructed upon the south side of said viaduct over the tracks of the said Michigan Central railroad a passageway for teams, to be not less than twenty-four feet in width, with the necessary approaches to the same, of not exceeding four per cent.

grade, and the posts or supports of the said viaduct to be so set as to afford to said — and convenient access from the street under the viaduct to said approaches at either end of the same.

There shall also be provided on the north side of said viaduct a sidewalk for the use of footmen over the tracks of the said Central railroad, to be reached by safe and convenient stairways from either side of tracks below. And such sidewalks shall be of such width as the ordinances of the city of Detroit shall require, and shall also be provided with safe and sufficient railings to insure the safety of people from falling from said sidewalk when passing along the same.

The plans for the said viaduct, with the said passageways, hereby ordered to be erected, will be submitted to the commissioner of railroads for his approval before the same shall be adopted, and the structure put in course of construction in accordance therewith.

Given under my hand and seal of the department at Lansing, this 30th day of April, A. D. 1890.

SEAL.

JOHN T. RICH, Commissioner of Railroads."

Mr. Baker: It was in pursuance of those orders that I have just read that the Fort Street Union Depot Company submitted the plan (Exhibit 5) which I hold in my hand, which I have already offered in evidence, and upon it is the indorsement of the commissioner of railroads that he approved the plan of construction set forth upon this diagram or map, which has been explained to you by Mr. Ellis, the engineer. This certificate indorsed of approval is dated April 30, 1890. In connection with that I desire to read in evidence the formal order entered upon the journal of the office by the commissioner of railroads.

164 Mr. Dickinson: I make the same objection to this, as

immaterial.

Mr. Baker: This order was entered up the following August. I will read it.

Mr. Baker then read the order referred to, as follows:

"STATE OF MICHIGAN:

Office of the Commissioner of Railroads, Lansing, Mich., August 5th, 1890.

In the Matter of the Approval of the Plan for the Proposed Viaduct of the Fort Street Union Depot Company, with Crossing of the Michigan Central Railroad Tracks in River Street, in the City of Detroit.

On the 8th day of November, A. D. 1889, the board of railroad crossings approved the map of the proposed route of the Fort Street Union Depot Company's approaches from the westerly line of the lands of the Detroit Union Railroad Depot and Station Company and (30) thirty feet northerly from the south line of lot 28, Loranger farm, south of Fort street, thence running northeasterly to the west line of Third street, in the city of Detroit, at the point designated on said map as the eastern terminal of the proposed route.

Said approval was conditioned for the erection of an overhead passageway or viaduct for the use of teams and footmen at the crossing of the Michigan Central Railroad tracks in River street, near the intersection of Eleventh, in said city; such structure to be erected at the joint and equal expense of the two companies in interest, after the approval thereof by the commissioner of railroads.

Subsequently the question of the authority of the board to make such condition having been raised by the depot com-

pany on the 30th day of April A. D. 1890, the commissioner of railroads, acting under authority vested in him by the provisions of section 17, act No. 79, Session Laws of 1873, and the several acts amendatory thereof, issued his official order for the construction of the said overhead passageway, prescribing general details for such construction, conforming practically to the requirements of the order of the crossing board; the plan for the structure to be submitted to the commissioner of railroads for his approval before the same should be adopted and the construction thereof commenced in accordance therewith.

Conformably to the requirements of said order, the said depot company, having on or about the 25th ult filed for my approval a plan of the proposed viaduct to be by the said depot company erected, together with the overhead crossing for teams and footmen at the crossing of the tracks of the Michigan Central railroad in River street, and having on the 2d of August inst., at the offices of the Michigan Central Railroad Company, in the city of Detroit proceeded to the hearing of the application for the approval of said plan of the said viaduct, at which hearing Henry Russel, general attorney and acting manager of the Michigan Central Railroad Company, appeared in its behalf, and Messrs. F. A. Baker, counsel, and Henry C. Potter, Charles M. Hayes and Charles M. Heald, directors of the Fort Street Union Depot Company, appeared in its behalf.

After hearing all parties in interest, and having duly considered the premises and all the facts connected therewith, I am of the opinion that the plan of the said viaduct and the overhead passage way of the tracks of the Michigan Central railroad in River street

near Eleventh, so submitted to me for approval, should be, and the same are hereby, approved, and the said depot com-

pany is hereby authorized to proceed with the construction of said viaduct in accordance therewith. In verification of my approval, in addition to this record, I have caused the original plan so filed with me to be placed in the records of this office, with my original certificate of its approval indorsed thereon, and the same is to be considered a part of this my order of approval and the construction of the aforesaid viaduct and overhead passageway.

At the hearing of the application for the approval of the plan presented by the depot company, the Michigan Central Company presented a different or counter plan for the same structure from that offered by the depot company, and asked that the same might

be substituted and approved in lieu thereof.

While this plan so proposed by the Michigan Central Company is open to no objection in itself, still, as the structure is to be erected by the depot company, and largely at its expense, and as the latter company has presented a plan that conforms to the order of the crossing board and the commissioner heretofore made herein, and which it prefers to be other, offered by the Michigan Central Company, the commissioner is of the opinion that he should not deny the application of the depot company for the approval of the same.

In the matter of closing River street at the approaches to the Michigan Central tracks by abutments of masonry on either side, which would result in a virtual closing of said-street to the use of the public under the viaduct, I have decided not to make such requirements as a condition for the approval of the plan for the construction of the work. While not doubting the power of the

167 commissioner to make such order, I am of the opinion that the rights and interests of the Michigan Central Railroad Company will be in nowise prejudiced by leaving such action to be determined by the future conditions of the situation, the sufficiency of the overhead passageway for the uses of the public upon that thoroughfare, and popular and municipal sentiment when the advantages to parties in interest or necessity for such action, in view of the public safety, shall be more clearly ascertained.

The Michigan Central Railroad Company having complied at large expense with the order of this department in the construction of an overhead passageway over their tracks for the use of the public, clearly could not consistently be required to furnish additional protection at that exposed point, and it is not doubted that in the near future River street at the Michigan Central Railroad crossing will be ordered permanently closed without objection from any quarter.

JOHN T. RICH, Commissioner of Railroads.

A true transcript from the record.

W. C. RANSOM, Deputy Commissioner of Railroads."

James F. Joy, sworn in behalf of petitioner.

Examined by Mr. BAKER:

Q. How long have you lived in Detroit?

A. I have lived in Detroit 56 years. Q. What year did you come here?

A. 1836.

Q. That was a year or two before Michigan was admitted to the Union as a State?

A. Two years before.

Q. And you have been here ever since?

A. Yes, sir; that is, it has been my home here ever since.

Q. You have been away temporarily?

A. Yes, sir.

Q. Are you educated for the bar?

A. Yes, sir; I practiced law here a good many years.

Q. You practiced law here in an early day?

A. From 1836 up to 25 years, more or less, about that.

Q. When did you first become interested in the railroad business?

A. In 1846.

Q. What company were you first connected with?
A. The Michigan Central Railroad Company.

Q. In 1846, when you were first connected with that company, what kind of a railroad did they have, where did it run to, and

how much of an enterprise was it?

A. In 1836, when the legislature sat, in 1836 I think it was, was when the five-million loan was authorized by the State, and they issued five millions bonds to be sold for the purpose of constructing three railroads, the Michigan Central, the Michigan Southern, and the Northern line from Port Huron; they succeeded in building the road from Detroit to Kalamazoo with a flat rail. They succeeded in constructing the Michigan Southern road from Monroe, I think, out perhaps as far as Hillsdale. The State had become bankrupt utterly; its bonds were not paid for, it had used its credit as long

as it could use it by issuing what we call in modern times greenbacks, the notes of the State, to raise money on, until finally, in 1846, having failed to build their road further than Kalamazoo, and the road having nearly worn out as it was, they passed an act of the legislature to incorporate the Michigan Central Railroad Company and sell the Michigan Central road. That is the present act of incorporation under which the Michigan Central railroad acts.

Q. Was that the occasion of your first connection with that com-

pany?

A. Yes, sir; I was, during that winter, employed by the gentleman who came here, Mr. Brooks, who was trying to get up a company to purchase the road, and I was employed to superintend and aid in drawing the charter and getting it passed through the Michigan legislature that winter.

Q. Who was this Mr. Brooks?

A. The man who came out here as chief engineer to build the road after the company was organized. He was at that time superintendent of a railroad from Syracuse to Rochester, by the old route, as it was called, the Albany & Syracuse railroad.

Q. What kind of rails were used on the Michigan Central rail-

road at that time?

A. They were what we call flat rails, about half an inch thick, laid on the top of wooden stringers like that.

Q. Strap rails? A. Yes, sir.

Q. Where was the depot at that time? A. It was on the Campus Martius.

Q. On the site of the city hall?

A. I think it was right here; yes, sir.

Q. How long were you connected with the Michigan Central railroad after that?

A. All the time, either as counsel, or as an officer or president, up to the time when Mr. Vanderbilt bought the road.

Q. About when was that? A. About 10 or 12 years ago.

Q. What positions did you hold on the Michigan Central-what

were your official relations to the road?

A. I was first for a great many years its attorney and general counsel, having general charge of all its legal affairs, and a good deal of its business.

Q. That is, you were the lawyer that had charge of its legal af-

fairs?

A. All its legal affairs; yes, sir.

Q. And then after that what were you?

A. After that I was a director in the road for some years, and after that I was director and counsel, and after that I was president of it—managed it.

Q. Was about all your time devoted to the interests of that com-

pany?

A. No, sir; while I was connected with that company I was connected with a good many other enterprises.

Q. Will you state what additional railroad experience you had

in the meantime?

A. During all that time?

Q. Yes; I want to show your knowledge and experience as a

railroad man, as preliminary to other questions.

A. I will show you how the railroads grew. When we got the Michigan Central built around to Chicago and while we were building it around, the Lake Shore & Michigan Southern was being built also around the lake shore from Toledo; when we got to Chicago the question was what connections they should

171 have beyond that. There had been what was called the Galena railroad, which was the Galena & Chicago road, in-

tended to extend from Chicago to Galena.

Q. That was the place that was subsequently known as the home

of General Grant?

A. Yes, sir, he lived at Galena. But the Illinois Central was also projected at that time, and was to be built from Cairo up to Chicago, and from Cairo up to Galena with a branch. I had been pretty well known as the attorney for the Michigan Central throughout the country in the course of quite a number of years, and when the Illinois Central came to Chicago they wanted to employ me to superintend their getting into Chicago, and also at Galena, and I was employed by that company for two or three years. While so employed the Michigan Central having been completed around to Chicago, there was a road projected—there was a little short road then called the Chicago & Aurora railroad, which was a branch of 13 miles of the Galena road running about 30 miles out of Chicago. running down to a town called Aurora. When the Illinois Central was projected it had a long branch, 200 miles long, and more, running up to Galena, that was half built. The Michigan Centralmyself and Mr. Brooks were pretty much the Michigan Central-conceived it was important for us to get a connection with the branch, so as to do their business from Cairo, when they went into Chicago, as a feeder for the Michigan Central, and we planned what was called the Chicago & Aurora road, extending down to Mendota, where it connected with the Illinois, running up to Galena, 150 miles, 300 miles north of Cairo; having projected that road, it be-

came necessary to have an amendment of its charter, and I
went to the Illinois legislature in 1852, perhaps, to get that
charter amended; they had no general railroad laws then;
I got the charter amended so as to extend it down to Galesburg and

Burlington, in Iowa, and I went there——Q. What became of that enterprise?

A. I got that charter through, and among other gentlemen whom I got to help me pass that charter was Abraham Lincoln, then living at Springfield.

Q. A practicing lawyer there?

A. Yes, sir, and whom I used to employ. We got that charter amended, and I raised the money—canvassed the State of Illinois

173

for it, and raised the money—and we undertook to build it, and did build it.

Q. What is that road known now as?
A. The Chicago, Burlington & Quincy.

Q. One of the largest railroads in the United States?

A. Yes, sir, quite as large as any other. It has grown like all other of those enterprises. We extended it to Quincy; we extended the Hannibal & St. Joe, and extended the Chicago & Burlington to Iowa, and it has been growing since I left it. When I became president of the Michigan Central railroad, at Kansas City, it had branched southward, and I built the Kansas City, Fort Scott & Gulf road to the Indian country; from Kansas City we built a road up to Omaha also. All of those things were done mainly by myself and Mr. Brooks. Mr. Brooks was living here. When I was made president of the Michigan Central road, it was the only road stretching across the country. The war had just ended, and, during the war and for some time before the war, there had been little done in building railroads. All these that I have told you about has been since the war. There had been little done in building rail-

roads at that time, but it was evident that more railroads would be built in this State. While I was president of the Michigan

Central road, the road was undertaken from Kalamazoo up to Grand Rapids. The Detroit & Milwaukee had been built from here through to Grand Haven; that road was helped by the Michigan Central from Kalamazoo north. Then came the Grand River Valley road from Lansing to Grand Rapids. It was important to get a direction from Detroit to Grand Rapids as straight as we could get at that day. Therefore the Michigan Central people and myself-I happened to be circumstanced that I could command a good deal of money, was connected with men who had money in the East, and particularly those connected with the Michigan Central road, and I was enabled to enlist them in these various enterprises, and among them was the Grand River Valley, the Detroit, Lansing & Northern, the Detroit & Bay City, all of which were built by the men connected with the Michigan Central rail-The Great Western in Canada was taken up by them, and they brought the New York Central in line, and with what strength we could get in Canada, we took that and built it. All these were done by the commencing of the Michigan Central, and to make feeders here to Detroit.

Q. All this was done while you were president of the Michigan

Central?

A. While I was counsel and president. Then came the Wabash here, wanting to come here into this city, and we organized a company here principally of men in Detroit, to build what was called the Detroit & Butler road in its day, intended at the time to become a part of the Wabash, and which afterwards became a part of the Wabash; that was built from Detroit to Butler, there connected

with the Eel River road, which was leased by the Wabash road and belonged to it, and made by them a direct route to St. Louis, and a circuitous route to Chicago.

Q. In your early experience in Chicago did you have any depot problems?

A. Yes, sir.

Q. Can you give us any testimony as to the development of the

railroad business in that respect?

A. We had the problem of the Illinois Central and the Michigan Central, which was a union depot of the two companies, in Chicago; and of the Chicago, Burlington & Quincy road, which I was at the head of, which had to establish its depot in Chicago, and we were a good deal connected, though we did not control the then depot of the Galena Company—it was a connection of the Michigan Central railroad. I have been familiar with Chicago from that time up, and with all the stations that have been established at Chicago. The first was the Illinois Central, the next was the Chicago & Galena, the next was the Chicago, Burlington & Quincy, and the others in their order, around the city; with three of those I had to do.

Q. Are nearly all those depots in Chicago union depots prac-

tically?

A. Yes, sir.

Q. A number of companies come into the same depot?

A. Yes, sir, several of them are union depots, and are such by their names and under the law, and the others are formed by three or four companies joining to pay the bills and expenses.

Q. In doing the freight business in Chicago, in a place where there is a large amount of cattle, sheep, horses, etc., brought to market, what was your early connection with that part of it?

175 A. I got up that company myself, organized it.

Q. State how the business was first done.

A. It was a union depot company. We first got an act of the legislature giving the right to organize a company; I have forgotten the name; it was to organize a union depot company for the handling of cattle, and the stock yards grew out of it.

Q. The Union stock yards?

A. Yes, sir, it is the Union Stockyards Company, so named by law. It cost us in the beginning—I got the money from officers connected with the various railroads, the stockholders of the railroad companies subscribed stock in it, and I think there was at first subscribed about \$500,000.

Q. What was the necessity of having such a place?

A. Each company at that time had cattle yards. The Chicago & Northwestern, who succeeded the Galena, had its cattle yards on the northwest side; the Chicago, Burlington & Quincy had some cattle yards in the vicinity. The Illinois Central had some cattle yards in another direction. The result was, there being no connection between the companies, that cattle had to be driven through the city when they wanted to ship it. And when parties at Chicago wanted to buy cattle they had to go all around the city to buy them; there was no place where they were all brought together, and the result was the organization of the Union Stockyards Company, with authority by law to build the branches connected with each railroad to get to Chicago, and authorizing the building of large stock yards

there, which should be large enough to accommodate all the business which should go to Chicago, and that would connect with every road built to go to Chicago. We built those stock

yards there, we built branches from those to every road in

the country, and the result was every other stock yard was discontinued, every railroad running into Chicago, running to those yards with its stock and cattle, and the cattle and hogs were congregated there, and when they wanted to ship them East, Eastern railroads went out there to ship them, and the cattlemen and hogmen went there to buy their cattle and hogs.

Q. It became the largest cattle market in the world?

A. By far the largest in the whole world probably, and has remained so ever since, and has been the thing which has done more. perhaps, than any one thing to build up Chicago.

Q. In the development of the railroad business and Michigan and the Northwest, can you give us any financial or physical

reasons why a union depot company should exist?

A. The necessity of union depot companies in all cities now has grown out of the fact that no railroad company in any great city is rich enough to build a depot; it costs so much to get into Chicago that no one company is able to do it; the result is that the Illinois Central and Michigan Central first united, then the Chicago, Buriington & Quincy, and the Milwaukee & St. Paul and Chicago & Alton united in a passenger depot on the north side—the roads coming in from the north; and lately the Wisconsin Central road coming in from Lake Superior, and roads running from the east around to connect with them have formed a union depot, and the expense is so enormous to get into a great city that no one company can do it, and always, wherever they do get into great cities now, it is by a union of two or more companies, and making a union depot.

For instance, in this city, here is the Flint & Pere Marquette 177 has no depot grounds here, no station; the Detroit, Lansing

& Northern has no station; the Canadian Pacific has no station here at all; the Canadian Pacific comes from the east; the Flint & Pere Marquette Company runs all over this State north, clear up across the State over to Marquette; the Detroit, Lansing & Northern runs west and north and up through the State, pretty well up towards Mackinaw, spreads most all over the State; but neither of those companies is rich enough or could raise money enough to come into the city of Detroit and build this union depot, neither of them, to save their souls, could raise money enough and get into this city on a separate basis.

Q. You were connected with the old union depot company at the

foot of Twelfth street?

A. Yes, sir.

Q. What road is using that depot at present?

A. The Wabash.
Q. The Wabash has a terminus here that comes in from Butler, Indiana?

A. Yes, sir, it is the Butler road, as we call it; the Butler road was consolidated with the Wabash, and that is its station grounds. I will tell you the history of that. When the Butler road was organized there was no connection with the Southwest here by which there could be a free and easy connection with the southwestern country. The Wabash desired to come to Detroit. They telegraphed me to ask if I would allow myself to be elected into the directors of the Wabash road. I telegraphed that I would not, that I was getting out of railroads and did not care to be complicated with them, and that I could not do it. Then I got a letter from Mr. Gould, I guess, saying that they wanted to build that

road up to Detroit if they could do it, and they wanted me to go in their board to help them. I told them that if that was their object, if I could be of any service, I would come in, and they elected me to their board with that view. After I was in their board, I met with them to discuss that question, and the Wabash then was not rich enough. It was not a rich company. It had been bankrupt once or twice before, but still the men connected with it, some of them, were rich. I went to New York and discussed it with them, to see how much money they would raise, and how much we could raise here in Detroit. Three or four of them there said they would contribute, take stock, but only three or four of them. I consulted with friends of mine here, and I could get up a corporation that would raise something more than half of the money required. We joined together, and with what I could get in New York from the men connected with the Wabash, and with an agreement on their part when it was done to consolidate the road with the Wabash, so as to give us some credit, and what I could raise in Boston, we raised money enough to build that road, but it was with the agreement, however, that they should have some place in Detroit where they might do business, and that I should provide it.

Q. State what you did to provide that accommodation for them?

A. First I made an agreement with the Grand Trunk road by which the trains should run around the city and come in what is now the Grand Trunk depot. The Grand Trunk owned a road from the junction up here. We built the Wabash first up to the junction so as to connect with the Grand Trunk, and under a contract with the Grand Trunk and the Grand Haven & Milwaukee road, I got the right to run their trains around to the Detroit & Mil-

waukee grounds and do their business there, and I supposed I had complied with my promise to get a depot ground for the Wabash people. When they began to run their trains around there, they found that depot ground occupied by the Lake Shore & Michigan Southern, and at that time also by the Flint & Pere Marquette, I think, but at all events by the Grand Haven & Milwaukee, and by the Lake Shore & Michigan Southern, and when they began to run there they found that that company was crowded in their depot grounds, that they could not let their trains run upon the grounds; they had to stop them at the horn out there, where the Wabash obtained three or four acres, where they had to make a turn, and they call it the horn. They had to stop their trains there, and when the ground was free down below, the Grand Haven Company would go there with a switch-engine and take

them in, and take them back to that ground. It was found so inconvenient that it was impossible for the Wabash to do their business there. Then the question was, What should be done? They had a road extending from here to St. Louis, with no place to do business. I consulted also with my friends who had helped me to build the Butler road, stated the case, and I said to them, "Here is the Wabash now; we have got here, and it is not worth anything to us; we cannot do business here; we cannot go on the Michigan Central ground, that is so crowded, and they would not admit us anyhow, because it is a rival road. What shall be done?" I consulted with the Flint & Pere Marquette people, and with the Detroit, Lansing & Northern people, and with the Grand Trunk people at that time, who were running down to the junction, and did not own the Great Western at that time. They gave me one

own the Great Western at that time. They gave me encouragement to say they would join us in an enterprise to establish a new union depot, that is, the old depot grounds down there; they substantially agreed to join us there. The Grand Trunk wanted a place very much, the Lansing and the Milwaukee wanted a place very much; and upon the hopes and with the encouragement they gave us, we undertook to acquire those grounds down there and have a union depot ground where we could bring those four companies together.

Q. What connection did the Wabash have with that?

A. Wait a moment. Before that was done, I consulted with the Wabash people, told them what we could do, and they made an agreement with me that they would use a part of those grounds anyhow if we obtained them. I had their written agreement, familiar to you, growing out of the lawsuits we had. The Grand Trunk also, and the Flint & Pere Marquette, and the Lansing, substantially agreed to come in, although there was no agreement reduced to writing, but upon the faith that they would come there, we undertook the work.

Q. Who organized the company?

A. I did myself.

Q. Who were your principal stockholders?

A. Out here, Chris. Buhl, Allan Shelden, Gen. Alger, M. S. Smith, and Mr. George W. Balch.

Q. Were they all Detroit gentlemen?

A. Yes, sir.

Q. All interested in Detroit?

A. Yes, sir; and it was largely the interest in Detroit which we had which induced us to undertake it; I would not have undertaken it without that. Well, we went along and bought the property and advanced the money, bought the old depot grounds

down there. There was then about 20 acres of land, but it had the right on the river. In that state of things and just then, the Grand Trunk railroad bought the Great Western railroad

Q. The Great Western was a road running from Windsor to London and beyond?

A. From here to Niagara Falls.

Mr. Dickinson: That was in 1886?

A. I don't remember when that was. They bought that road earlier than that.

Mr. Baker: You organized a depot company with the expecta-

tion that all these roads would come in there?

A. Yes, sir; after we had organized it, and after we had got into it, and after we had made a contract with the Wabash, and where we could not back out and had to go there, the Grand Trunk bought the Great Western road.

Q. What change did that make in their policy?

A. The Great Western road owned the Detroit & Milwaukee.

Q. That is a road running through Michigan?

A. Yes, sir; when they bought that road then they owned that depot ground up there, and they made up their minds they would run there, and they broke faith with us down here, and they would not come there. The result was we were pretty badly laid out. The Lansing road and the Flint & Pere Marquette road said, "It will be too heavy a thing for us to undertake to go down there; we cannot do it." The result was that they stayed with the Michigan Central for the time being, inconvenient as it was. In the meantime, to carry out our contract with the Wabash, and get that into the city and where it could do business, we went along and filled

up the depot grounds, built the elevator which we had agreed to build, built them a freight-house, built them a small

passenger-house—the old plan having failed—and acquired the right of way out to Delray to the Wabash road, so as to connect with that; and from that time they came up to the depot grounds and used those grounds.

Q. You have had a small passenger-house there since then?

A. Yes, sir; a little temporary house, not expecting to remain there, but to do the little business that was done there with the Wabash alone.

Q. You can state any reasons that you have, that you have learned by experience or otherwise, why it is not a suitable location

for a passenger-house at that point.

A. It is too far out; it is three-quarters of a mile, nearly a mile, when you go down to the passenger-house there-further than the Michigan Central. Passengers going into the country, going to competing points, will take the depot that is nearest them. The result was the passenger business of the Wabash done there has been very little, simply because it was so far out and inconvenient. Half the time there will not be an omnibus to take them up to the city; they will be employed in other depots. The Chicago business is limited, because the Michigan Central can do business to Chicago and have a depot right in the city here, so when a passenger comes from Chicago and knows where he is going to land in the city of Detroit, and he comes here at midnight, in the one case he is a mile further away than he is in the other. There may be an omnibus down there and there may not; they both come in about the same time, the Michigan Central with a great load of passengers and the Wabash with a small one. The result is that being down there in

184

that way, with a passenger-house so far beyond the Michigan Central, it does business at a great disadvantage, and it cannot get the business, except by, perhaps, when they were at liberty to do it, cutting rates or something of that sort.

Q. You speak of the Wabash road that competes with the Michigan Central to Chicago. How is it with the Flint & Pere Marquette and the Detroit, Lansing & Northern; do you think they could do

a successful passenger business from the foot of Twelfth street? A. No, sir; not at all; no more than the Wabash can, nor so well even, for the Wabash does have a large tract of country for which it has better facilities and conveniences than the Michigan Central; for instance, passengers wanting to go to St. Louis, a man can go by the Wabash quicker by a good many hours than by going around by Chicago, and they will suffer some inconveniences to cut that off; but to put the Lansing road down there, and the Flint & Pere Marquette road down there-and the Flint & Perre Marquette road is in competition with the Michigan Central road at Saginaw, all through the country in the north; the Lansing is in competition with the Michigan Central at Lansing, Grand Rapids and all the country north; and the result is that if they cannot get a convenient depot in this city they cannot do a passenger business here. It is thus a necessity that brings the companies together. Now, when it came to be established that the Canadian Pacific was to be built here, and there were four companies would unite together to pay the expense of all this great work, then the Flint & Pere Marquette and Lansing said "Well, if you have your company made up again as before, four companies in there, we will join you."

Q. State the circumstances under which the Canadian

Pacific were led to come here.

A. I had to exert myself a good deal to get the Canadian Pacific to come here. Four years ago, I guess it was, Sir George Stephens, who was then at the head of that road, before it was built across the country up north, wrote a letter to me asking me to come to Montreal; he said if I would he would have his train at St. Thomas down here to take me through—a special train. I told him I would come. I went down there. At St. Thomas I found a special car waiting for me with Mr. Van Horn on board.

Q. Who is Mr. Van Horn—an American or an Englishman?
A. The man who succeeded Sir George Stephens as president of

that company. He is now president.

Q. What kind of a railroad man was he?

A. A first-rate man, brought up over here in Illinois. I first knew him at Kansas City. He was afterwards superintendent of a division of the Milwaukee & St. Paul, where I knew him, and afterwards I found him down at Montreal, general manager of the Canadian Pacific. He was on board, and I went down to Montreal. St. Thomas is about 100 miles from Detroit, running through to St. Paul. They wanted to talk with me, apparently, about their road through the Northwest. Sir George Stephens was a man fresh in the railroad business. He wanted to talk with me about whether they should have separate corporations in their road, one for the

West and one for the East. I saw by the map that it was very easy for St. Paul to build a road up into that country, to tap that road. I said to him, "Mr. Stephens, if you want to build a road for Canada and for Canada alone, and to carry your business there, you had better have it one cor-185 poration, because if the corporations are separate, the western corporation will work with Michigan corporations and you may lose a good deal of business, which you might maintain and keep with one corporation." After talking about that and various other things, I said, "You have got a road from Montreal to St. Thomas." He said, "Yes." I said, "It is a very good road." He said, "Yes." I said, "What are your plans about that road; you are not going to stop at St. Thomas always?" He said, "We have not got any plans definitely fixed, but if there were a road from Detroit to Chicago, as well as from Detroit to St. Louis, and we could get into Detroit, get connected with them so as to do business well, I think we might extend that road to Detroit." I said, "Well, Sir George, if you extend that road to Detroit, I think I can guarantee to you that we will have a road from Chicago to Detroit better than we have got now." He wanted to know how, and I showed him our map, what we had already built; showed him our entrance into Chicago, which we had already acquired, and that it would be only 150 miles of country road to build, with no station grounds to build at all at either end, and that I thought we could make the strength enough to build it; and that if they would agree to build their road to Detroit, I would agree to get a road from Chicago to Detroit-Detroit to Chicago. I said to him, "Sir George Stephens, if you will build that road to Detroit, I will tell you what else you will have to do." He said, "What?" I said, "Your road runs from Detroit in the direction of Niagara Falls, until you get within 40 or 50 miles of the Falls; you will have to build a road straight to the Falls, so as to make a through route to New York." It seemed it was the first it had struck his mind. I said to him, "I think it can be done if you come to Detroit; you cannot help building that if you come to Detroit; neither can we help getting a line to Chicago if you come to Detroit, and it will make a valuable line, especially in Canada, and in the West for us." He didn't say he would, but they did make provisions for it, but they intended to let it remain until we built the road to Chicago. Two years ago, I went down to see him, and I said to him, "Sir George, I don't see that you are doing anything to your road to Detroit." He said, "We have planned to build it, but we are waiting for you." I said, "You cannot wait for me, there is some difficulty at Chicago about our entrance to Chicago; the Grand Trunk is making some difficulty; the Wabash is a bankrupt road, as you know, and at present I am not in a position to undertake it, but we are reorganizing the Wabash, and shall, undoubtedly, succeed in getting it reorganized, and when we get there I shall be in a position to unite with it, but in the meantime we have a road to Chicago that we can use, and comfortably

use;" it was the Baltimore & Ohio, we had been using for passen-

gers, and further around for freight; "so that we can give a very fair route to Chicago as it is, but not as good as we could if we built; you must build your road now." I showed him the necessity; "we have a route there to St. Louis, we will have a Chicago route and all; but do not wait for that." He called in Mr. Van Horn, and I discussed it with him, and I said to him, "I do not know of any case in this world where the expenditure necessary to build a 100 miles of road will give us so much value to all the rest of the line as it will to build it now into Detroit; you have got several hundred miles from there to Montreal, you

open to you a heavy business from St. Louis and a good freight business from Chicago anyhow at once; it will pay you twice over, all the money you can put into that road, by the benefit to the rest of your line." He called in Mr. Van Horn, and he said, "Upon full discussion, you are right, I think, Mr. Joy. We will have a meeting of our board next Tuesday, and I will bring this thing up, and I will tell them what you say, and I will have a resolution passed one way or the other, and I will telegraph you if they pass the resolution to build that road at once; I will telegraph you at once." I came home, and on Tuesday morning, I think, I got a telegram from Sir George Stephens, saying all right, they would build the road.

Q. It has been in operation now some months?

A. Yes, sir.

Q. And they have terminal facilities?

A. Their trains cross the river and come to the old depot grounds. It is a great inconvenience, so far as their local passengers are concerned, but they are there. Now, that company and the Wabash Company, and the Flint & Pere Marquette Company and the Lansing Company are without any proper passenger station in the city.

Q. Where have the Detroit, Lansing & Northern and the Flint &

Pere Marquette been doing business the last 8 or 10 years?

A. Down at the Michigan Central road, the Flint & Pere Marquette are doing business; I made the arrangement with them when I was president of that road; I made an arrangement by which they should turn off when they got to the junction, 18 miles out here, that they should come in on the Michigan Central, and

they have been running there ever since; and I made the same arrangement with the Lansing; but the Michigan Central is so crowded with business that it is impossible to give them the accommodations they want and the state of feeling

give them the accommodations they want, and the state of feeling between them is so great that they cannot work together with peace and comfort, and they have got to get out.

Q. What does that arise from?

A. From the fact that they are competitors. All the business between Grand Rapids and the east is competed for by the Michigan Central and the Lansing; all the business at Bay City and all the business at Saginaw is competed for by the Michigan Central and the Flint & Pere Marquette.

Q. The Michigan Central has a line that runs to Bay City and the Saginaws?

A. Yes, sir.

Q. And a branch from Vassar to Saginaw?

A. Yes, sir.

Q. And the Flint & Pere Marquette runs to the same places?

A. Yes, sir. And the result is constant ill feeling and competition, besides the necessity they are under to have a depot ground more convenient to the city, and to act freely, so that they are willing to meet their share of the expenses of this depot ground down here. That is what has brought this about. It is brought about by the most absolute public necessity that has ever existed in the world.

Q. What are the relations of the stockholders of the Fort Street

Union Depot Company to these four railroad companies?

A. One-quarter of the stock is owned by men connected with the Flint & Pere Marquette road, one-quarter of the stock is owned by men connected with the Canadian Pacific road,

one-quarter is owned by men connected with the Lansing road, one-quarter is owned by three or four gentlemen here, the Wabash being at that time poor and not fully reorganized. When this company was organized there were three or four gentlemen here who agreed to join me and advance the money necessary to secure the Wabash its entrance here into the city, and we are doing it. One-quarter, therefore, belongs to us, but with the understanding and agreement that the Wabash shall be one of the lessees of this ground and this depot, on equal terms with the others.

Q. Who are those gentlemen who are associated with you?

A. Chris. Buhl, Allan Shelden and myself, Senator McMillan and Mrs. Newberry. It was John S. Newberry, but he died—no, McMillan signed for Mrs. Newberry when Mr. Newberry died. I may be mistaken; McMillan was one of the parties down on the old ground, and Newberry also.

Q. They are substantially the same stockholders that were in the

old union depot company?

A. Yes, sir.

Q. And I suppose your connection with it is to protect the interest of that company and in that way the interest of the Wabash?

A. We were in this position on the old grounds: Half of our grounds were not leased, half was leased to the Wabash; if these new companies came in here they would want that ground down there. We were therefore interested to that extent in getting them

in; it gives them a good place for their freight business, and it gives them up here a good place for their passenger business, and those things, together with the interest we had in the prosperity of this city, and all of them had that, made us unite

together to make up the Wabash share.

Q. The Wabash was in financial straits and unable to advance the money?

A. They could not do it.

Q. And these stockholders of the old union depot company are doing it for them in that way?

A. Yes, sir.

Q. As to their quarter?

A. Yes, sir. Purely and simply for that. We want the Wabash to have as good a place in the city as any of the rest of them.

Q. The Fort Street Union Depot Company appear to have located their grounds on the corner of Third street and Fort street west?

A. Yes, sir.

Q. By the act under which the depot company is incorporated, the company is required in its articles to locate its grounds, and the articles do locate it: and then they are required to make a map and survey of the grounds and route. Will you go on and state the reasons that actuated the board of directors, the officers of this company, in selecting that location, and I ask you that as a man of a very large railroad experience?

A. It is not my railroad experience alone. One of the things the Canadian Pacific said, when discussing the building of their road through to here was: "You have not got any good place in Detroit for passenger business, Mr. Joy." I said: "That is true, but if you build your road there, the Flint & Pere Marquette and the

191 Lansing will join us, and we shall get strength enough to acquire a place where passenger business can be done; we cannot do it alone, but if you build your road there, so that we can build up a passenger business for St. Louis and a passenger business for Chicago, we can get strength enough to get a ground there." Mr. Van Horn says: "I will come down there and look it over with you." And he came here, and Mr. Crapo, who lives at New Bedford, Mass., the president of the Flint & Pere Marquette road, came here; Mr. Thayer, of Boston, who is the president of the Lansing road, came here. I got them all here; I took them down and showed them the old depot ground there; I showed Mr. Thayer the 20 acres of land which we could lease them down there; he came here alone; I showed him where, in my judgment, the best place for a passenger ground in the city was, and that was at this point where we subsequently located it. Mr. Van Horn and Mr. Crapo came here separately from Mr. Thayer. Mr. Thayer came here alone. I took them both down there to look at that ground. They said: "Well, yes, this is a good place; it is the place exactly for passenger business, but how are we going to get there?" I said: "Well, there is some difficulty about that, but what ought to be done I have never known to fail of being done; what ought to be done we can do somehow." There was a talk; we discussed coming right along up Fort street.

Q. Just south of Fort street?

A. Yes, sir.

Q. Through the private property?

A. Yes, sir. In that case we should have to break off from the old depot ground, down below Twelfth street, and go between Scotten's two buildings on Twelfth street, and come up to the front on Fort street, and then run up, but that would

stop every highway there was there; I mean that we should run across every highway south of Fort street, and we should have to shut up every one of them; we should have to build them up to have the grade high enough, having crossed the Michigan Central 18 feet high, and being compelled to come up here on Fort street. where it was a good deal higher, we would have to build those roads up so as to cross them at grade; we could not go high enough to go under; we would have to cross them so as to destroy the roads probably. Then the question came up whether we could run through the middle of those grounds, and the difficulties were so great that that was found impossible; we would have to either build up along as we went there through the middle of those grounds, cutting them right off, or else go down to the grade, which we could not do, because we would have to go down deep. question was, whether we could come down by the Michigan Central on the River road; we discussed that, but we had got to go over the Michigan Central so high that we could not get down to those grounds on any grade that we could use. Therefore, the one possible place where we could get was where we go now. We found we could not get there; there was an enormous amount of property on Fort street that would have to be destroyed if we went that wav.

Q. If you went on the private property on River street and Fort street, you would have to go through that entire private property?

A. Yes, sir, from Twelfth street, clear up. I could not get means to do that. All these companies could not furnish money enough to do it. The question was, what we should do.

Mr. Van Horn, who is a very experienced railroad man, who has built an entrance into Montreal on the Canadian Pacific road, coming into the city on arches, coming up almost clear to the Windsor hotel, which stands up on the top of the hill; they come on arches for a couple of miles out over the streets, and over the buildings in fact, built on stone arches, costing an enormous amount of money; but they considered it important enough for their road to have that; in fact, he said he could not afford to have a second-class station in any great city-if he could not have as good a station as any other company in any great city, it was not worth while to go in there. When we went over the ground, he said, "The only place where you can get through, Mr. Joy, I think, within any cost that will come within our means, is to go across the River road." That was his suggestion, to come there first. We discussed that question in connection with the others, and we made up our minds, all of us, including Mr. Thayer, Mr. Crapo and the Wabash people, and the men connected with the Flint & Pere Marquette-Crapo, Thayer, Van Horn-we all made up our minds that that was the best route we could take, that it would injure property the least to come that way, that it would, as they thought, not cost such an amount of money that they could not afford to do it, and they thought by that way we could get through. A question arose about the Michigan Central, whether we could get any land of theirs, and we made up our mind we could not.

Q. Why?

A. For two reasons. In the first place the Michigan Central has been hostile to us and the Wabash ever since we began to talk of coming to Detroit, and we have met nothing but hostility and enmity from them.

Q. They have been hostile to you ever since you ceased

to be president of it?

A. No, sir; not since I ceased to be president, but ever since I took measures to get the Wabash road into this city they were hostile to that enterprise, fought it in every way they could, by injunction after injunction. Then they were hostile to the old union depot company, fought that in every way they could before the legislature when we were getting a charter, and in every possible way; and when this started they were more hostile, and the result was we could not do anything with them.

Q. You could not do anything with them by voluntary agree-

ment?

A. By any agreement whatever at all, not even to use this street.
Q. It has been suggested here that you ought to have laid out
this line through Michigan Central yards; will you give the reasons

why you didn't do that?

A. There are two reasons. If the Michigan Central grounds were not occupied at all, and they were open so that we could have laid our route through there, it is possible we might have run through those grounds, if it was not for the damage it might do to our ground below. We could not go through the middle of our own grounds below; if we did that we could not make use of it by a depot ground to be jointly used by all these companies, it would cut it right in two, and we could not use our own grounds that way without destroying them practically. As it is we can make those grounds join to the union depot grounds for all these companies, and we can make a very fine ground of it; but if we ran another

road though the middle of it, it would destroy the value of our own grounds, so that we could not use them. If we went through the middle of the Michigan Central, it would destroy the Michigan Central also-they could not use theirs. Therefore, if we had a law authorizing that we could not have done it, it would destroy both grounds practically for public use. Then, in addition to that, there is no law whatever under which one railroad company can take the grounds of another company by condemnation. There was a case in Massachusetts where two roads came into the city of Boston side by side, the Boston & Eastern road the main road, and the Vixburg road. The business of those companies had become so large that the Eastern road could not get the ground they wanted-I think it was the Eastern road; they had not depot ground enough, and they could not get them on one side at all, because there was an important highway and the public could not give it; on the other side the other company could enlarge their grounds without any difficulty. They would not let the Eastern Company, if that was the company, and I think it was, have any of their grounds voluntarily, because they said they wanted them all;

but the other company said, "You can enlarge on the other side of your road without any difficulty." "Well, but we don't want to be driven to that," the other company said. Finally they went before the legislature and asked for the privilege of condemning a certain portion of the grounds belonging to the other railroad company. It was discussed in the legislature before a committee. They made up their minds that the public necessities required that some of those depot grounds should be transferred to the other company, and that the other company should acquire additional depot grounds.

on the other side of its station, and they recommended the legislature to that effect, and they passed an act authorizing the condemnation of the grounds of the other railroad com-

v. That is the only case I know of that kind.

Mr. Dickinson: They were authorized, and did condemn that

depot ground?

196

A. They did, but under a special act of the legislature authoriz-

ing them to condemn that particular ground.

Mr. Baker: Has the legislature of Michigan ever passed any such statute?

A. No, sir; they passed a statute prohibiting our using the

grounds of another company.

Q. You say you were a member of the bar for a number of years, and the attorney and the president of the Michigan Railroad Company, and connected with all these different railroad enterprises, and you say you know of no law by which you could condemn a right of way across that property?

A. There has never been any law by which it could be done, and

there is not now.

Q. You would be a little surprised if Mr. Don M. Dickinson could point out such a law on the books?

A. I don't think it is possible for him to do it. I don't think it

could be done.

- Q. As a railroad man, what have you to say as to the practicability of building an elevated railroad along River street, so as to accommodate the business of these companies for the transaction of a passenger business at the corner of Third street and Fort street west?
 - A. From Twelfth street up?

Q. Yes.

A. I don't think there is any difficulty at all.

197 Q. What can you say as to the feasibility and practicability of the plan?

A. It is perfectly feasible and practicable.

Q. Is there any objection to it?

A. I don't think there is any, any more than there would be to building anywhere else, nor a quarter as much. The Michigan Central objected to it on one side, and we condemn the right all along there. Other people objected to it, and the object is to get money.

Q. In the development of railroad business, will you state whether

or not the resort to an elevated road is a modern development or

something that is obsolete?

A. No, sir; it has just begun. For instance, in the city of Louisville, the Louisville & Nashville road, which is now a great corporation, down South there, comes into the city of Louisville right along the levee down to its station ground up on the level of a main street, like our Fort street here; that is the high street and the chief street of the city; they come up along on an elevated road, for a further distance than we do, just about as high as we do, but their whole station ground stands on iron pillars, as well as their railroad, it is built on iron pillars there, because their ground falls off and they could not use it in any other way, so that they built that depot ground, bringing it up to a level with their business street, like Fort street here, built up to the level on one side, standing on pillars on the further side; the whole of it is on an elevated road just like this exactly. At St. Louis there is an elevated road being built in that city to connect the roads together, much like this. At Jersey City and for about 12 miles out of Jersey City, and running

through its main street, the Pennsylvania Railroad Company are building an elevated road; perhaps it is not so long as 198 12 miles, but it is a good long distance, and they run through the main street of Jersey City several miles to the river, and they build their elevated road, and as their business is across the river, and they have to go on boats, they build their station-house high,

so that their passengers can step from their station onto the boat. Q. The Pennsylvania road did go into Jersey City on the surface?

A. They were able to do that, and they are running now on the surface; I don't think their elevated road is done yet.

Q. But they cross a great many streets at grade?

A. Fifty or a hundred, I think.

Q. And the result was it was dangerous to passenger travel on

the railroad and to people on the highway?

A. They made up their minds it was cheaper to build their elevated roads and let the streets be under than it was to be subject to the inconveniences and damages from running through the city on

Q. That elevated road is in process of construction now?

A. Yes, sir; it has been going on for some years.

Q. This elevated road on the wharf, on the river at St. Louis, is now being constructed?

A. Yes, sir.

Q. Did you ever see the elevated road through the city of Newburg, on the Hudson?

A. No, sir; I never was there.

Q. The West Shore road out of New York is a new railroad? A. Yes, sir; it has been opened within the last three or four

Q. You have seen the elevated road through Rochester or Syracuse, I think it is?

199 A. They have raised the road through Rochester, but they have built that up to run through the street there still.

Q. But there is an elevated road through one of those towns?

A. It is through Rochester. It used to go on the grade; they have raised it up so that all the streets can run under the cross-

Q. So that in the development of the railroad business, this is a

movement or a tendency that is quite recent?

A. It is recent, but it becomes necessary in a great many cities

absolutely.

Q. That is, it is a necessity in cities where there is a large population and a large number of highways to be crossed? A. Yes, sir; a good deal better to do it, a great deal.

Q. You were in Europe last summer? A. Yes, sir.

Q. Do they resort to any such thing there in Paris or London?

A. In the city of London they do not build exactly as we do here in this street. In the city of London there are two or three railroads come in, for instance, at the same depot, and they have a . depot one above another, and the roads come in right over one another and cross one another, and they build the arches so high that they run over the houses of London. I never have examined them sufficiently carefully to say just how they were built. I have been there and have seen one arch running over another and over the houses, so that you can look into the chimneys. That was a cheaper way to build than to run at grade, a good deal.

Q. What about Paris?

A. In Paris I don't know of any elevated road. Paris is a more elevated city than London, and I think the roads in 200 Paris come in at grade; they do not come so far into the

city; in London they come clear to the middle of the city; in Paris it was so large a city and so expensive getting in, that they had to come in at grade. Therefore they cannot get so far into the city as they do in other places, but they get a pretty good distance into the city; they have the streets built overhead.

Q. Over the railroads?

A. Yes, sir.

Q. So the effort is in railroad construction at the present time to

avoid crossings at grades?

A. Yes, sir. That they do, so far as the roads I saw in Paris are concerned; the highways are carried over; the roads are carried over on pillars, just the same as those we put up here.

Q. In London they have an underground railroad?

A. Yes, sir, running all around London; but that is not built on pillars.

Q. I see they are going to build one, a double-decker, in Broad-

way, New York?

A. They are talking about it; but the importance of getting into any large city is so great that in London all the roads go into the center of the city; they go over one another and to the same depot. Q. Have they grade crossings as we have at Michigan and other avenues here?

A. I don't think there is a grade crossing of a highway in a city

in all England.

Mr. DICKINSON: There is no doubt about that?

A. I don't think there is one.

Mr. BAKER: Will you state whether in the development of railroad construction in this city, there is a tendency now to avoid these grade crossings?

201 A. Yes sir; they are going to be an awful nuisance in this city. There is a good deal of discussion about avoiding them on Woodward avenue.

Q. That is going on now?

A. Yes, sir; and that will continue to be agitated more and more every year until some result is arrived at, and so it will with all these grade crossings. They are an immense nuisance, particularly in the business part of the city.

Q. The controversy on Woodward avenue is to find out which

will go over and which will go under at present?

A. Yes, sir. In the city of New York, the New York & Harlem, which had the entrance into that city over the New York Central, and the New York & New Haven, used to go at grade and cross the streets at grade; perhaps it was ten years or more ago; so many people were killed at grade there that the city took it up; every year there used to be a good many people killed, and the city took it up with the railroads. The question was how the difficulty could be avoided. Finally when Mr. Vanderbilt got possession of the road, as he did, after he had it for a while, they made this agreement with the city; it was disastrous to both the railroad company and the city; the city agreed to pay \$3,000,000 towards the expense of changing that road so that it should not cross any street at grade. The city paid \$3,000,000 and the railroad company paid the rest, and the road was changed; some parts, where it went over the street at grade, it was raised, so that the streets now run under; where it runs through the hills, and some part of it was tunneled, but the result of it is that from Harlem down they run into the city without going across a street at grade; and the city paid \$3,000,000 and the railroad paid the rest. How they will get along with it in this city I don't know.

Q. In the line that is adopted along River street by the Fort Street Union Depot Company, are there any crossings

at grade?
A. Not one.

Q. Are there any crossings at grade in the union depot grounds themselves?

A. There — two streets in the union depot grounds, parts of which will have to be discontinued, and that has always been regarded as a necessity.

Q. And in all the streets up to Twelfth street those are the only

two?

A. Yes, sir.

Q. And those are where the depot business will be, and the trains will go and let off the passengers?

A. Yes, sir.

Q. And all the other crossings at Sixth, Seventh, Eighth, Ninth, Tenth, Twelfth, are all overhead crossings?

A. Yes, sir; all overhead, interfering with no street.

Q. From your experience with railroads, will you state whether there will be any practical difficulty in traffic going right on along River street the same after this structure is built as before?

A. The best illustration that I can tell you of is this: I was in New York the other day, and I had to go to several places downtown, and as I had to go to several places down in the lower part of the city, it was more convenient for me to take a carriage than to go on the elevated road, so I took a carriage to drive down to the lower part of the city. We got down until we came to the jam in Broadway; and the jam in Broadway from carriages and teams extends a good deal further up than when I knew the city many years

ago; it is a bigger jam. I could not get down Broadway with any convenience. I told my driver to drive out to the side

any convenience. I told my driver to drive out to the side street, where the elevated road was, to see if he could not get down there. I found the jam there just the same under that road; it spans the whole street just as we do. I said: "Well, get into the line, and see if we cannot get along," and so he got on one side and went along with them, while they were going along on the other side, and we got along. There was a crowd of carriages and teams going along there. He was compelled to go slow on account of the teams, and the railway trains were passing overhead, and all without any difficulty in the world; no man's horse was frightened, no man or horse paid any attention to the trains above; and that was just about as high as this road is here, and built with the pillars on the curbs of the streets all the way along, so that the whole street was open.

Q. How often was a train going overhead there?

A. Constantly; I could not say exactly; dozens were going while we were there.

Q. It has been stated here, one every minute and ten seconds.

A. I should think that; dozens went over while we were there for a few minutes.

Q. Didn't your team run away?

A. The horses didn't seem to know trains were going overhead at all. And so it will be here. Wherever there is an elevated road spanning a street, the street is used just as freely as if it was not there.

Q. Do the street cars run under that, too?

A. They did, but not where I was driving; but when you get further up on Sixth avenue, the railway cars go right on under the railroad, and teams and carriages also. The street there is a good

deal wider.

Q. From your observation and knowledge of railroads, and your experience of men, would you say there would be any difficulty in transacting the business that is done along River street under this elevated road?

A. Not the slightest in the world. It is done everywhere where elevated roads are.

Q. And River street is not a driving street, where ladies and gentlemen drive for pleasure?

A. No, sir; that would be destroyed by the Michigan Central crossing down there. No one would ever go there for that purpose.

Q. The Michigan Central has got a number of tracks across that

street?

A. They have a dozen or fourteen tracks, and occupy it all the time.

Q. Switching backwards and forwards there?

A. Yes, sir.

Q. But the business done on the river front is a freight business, a heavy business?

A. Yes, sir, entirely.

Q. Entirely a heavy business?

A. If anybody wants to go there with their teams, I don't think there would be the slightest difficulty in going along that road, any more than in New York.

Q. But it is a heavy business, and the horses are draft horses and

that sort of traffic, they are more sluggish horses?

A. Yes, sir.

Q. What effect did the elevated road in New York have on the light in your carriage?

A. It was a good deal lighter than this room is; a good deal

lighter than this room with those windows up.

205 Q. You know how this structure is to be built along River street?

A. Yes, sir.

Q. Do you think it would have any effect upon the light on Mr.

Backus' premises?

A. I don't think it would have a particle, any more than you might cut 40 feet out yonder five or six feet wide, 40 feet from these windows; it would not obstruct the light at all here (pointing to court-room).

Q. Could you give us any illustration of why the light would not

be affected?

A. It would be a good deal like taking out both sides of this room and leaving pillars like those to support the roof, and opening the roof here in two or three places the whole length of it, so that the sun could shine down in here. I think the street road down youder, with one side entirely open, and 40 feet on the other side entirely open, would be as light under that road as this room would be with both sides taken out, and pillars standing in here, one 30 feet apart, and pillars on that side 30 feet apart, with the sides entirely open for the light to come in, with one fourth of this roof entirely open, so that the sun could shine down.

Q. It is difficult to believe that that would have any perceptible

effect upon the light?

A. It would not have any perceptible effect, so far as light is concerned. I am speaking of under the road now. So far as Mr. Backus is concerned, I do not think it would have any effect at all; it is 40 feet from him, and it is like a ribbon stretching 40 feet away.

Q. And this obstruction, except early in the morning, would not

throw a shadow on his premises?

A. No, sir. If the sun got up an hour and a half high there would be no shadow there. The sun would be shining right on him.

Q. Have you familiarized yourself with the amount of the traffic that is done by these four different roads at the present time?

A. You mean the number of trains that pass over them?

Q. Yes.

A. Yes, sir.

Q. Will you give us the amount of business that is transacted by each of them, the number of trains that they run, and about how many cars in each train?

A. I don't believe I can tell you the number of cars in each

train.

Q Tell us how many passenger trains and how many freight

trains each road operates at the present time?

A. I don't think I can tell you how many passenger trains they run. I can tell you how many trains they run. The Flint & Pere Marquette runs six trains.

Q. Each way?

A. No, sir; both ways—six in all.

Mr. Dickinson: Passenger and freight?

A. I don't think they run any freight; that is my impression, but I may be wrong about that; but I have the impression that the Michigan Central haul their freight trains in from the junction.

Mr. BAKER: We will prove that by somebody else. You under-

stand they run altogether six trains?

A. Yes, sir. The Detroit, Lausing & Northern runs ten trains; the Wabash runs ten trains; the Canadian Pacific runs two passengers, and they have some freight, will have some freight, not up here, but on the lower road, but the trains run; Flint & Pere

207 Marquette, six; Detroit, Lansing & Northern, ten; Wabash, ten; Canadian Pacific, two, and then I have got four freight

trains here (referring to memorandum).

Q. They must be passenger trains you are talking about, in the first place?

A. Very well; there are only two freight trains. Thirty-two trains is all they run there now.

Q. Those are passenger trains?

A. No, sir; it includes all the trains running now.

Q. Four of those are freight trains?

A. Yes, sir.

Q. This depot that is to be at the corner of Third street and Fort

street west, right on the corner down there, is to be a passenger-house?

A. Yes, sir.

Q. Enough to accommodate these four roads and any other road that may desire to come in?

A. Yes, sir.

Q. What freight accommodations are to be furnished on those

same grounds, if any?

A. On the Congress Street front, after taking off all the grounds needed for passengers, about half the lot there on the Congress Street front will be used probably by the Flint & Pere Marquette and the Lansing road for a city freight-house, doing business with mcrchants here, taking their packages out and bringing packages in from the country.

Q. Is the Wabash to use that?

A. No, sir.

Q. Is the Canadian Pacific to use that?

A. No, sir.

Q. Their business is still to be transacted at the foot of Twelfth street?

208 A. Yes, sir.

Q. Is there an elevator at the foot of Twelfth street, where the grain of all these four roads will be handled?

A. Yes, sir; it is on the ground down there—a large elevator

down there.

Q. There are no conveniences up here for the construction of an elevator?

A. No, sir; no heavy freight will ever run up here; the grain and lumber and cattle of the country, and all heavy freight that comes into this city over any of those roads, will all be done down yonder on Twelfth street.

Q. So that all the traffic that will come over the elevated road will be the passenger traffic and the city package business of two

of the roads?

A. That is all.

Q. What do you mean by that package business, city business?

A. For instance, a merchant sells a box of dry goods or a barrel of sugar, or sells anything that he has in his store, which he wants to send to his customer in the country. It comes in barrels, or boxes, or packages, and for the Lansing and Flint & Pere Marquette roads it will go there.

Q. Are those roads that run into the interior of Michigan where

the merchants do business in the city of Detroit?

A. Yes, sir; and that kind of business will be done there.

Q. And I suppose the same kind of package business, where it comes in from the country, will come there?

A. Yes, sir.

Q. But the grain, and coal, and cattle, and lumber, and heavy freight business will all be done below?

A. Yes, sir; not a car-load will come there.

Q. Will this small depot upon these grounds, for this city package business, be of any utility to the merchants of this city?

A. It will save them, perhaps, a quarter cartage every time.

Q. It will be more convenient for them?

A. Yes, sir; it will save them hauling a mile or a mile and a

half, and save the time and expense of a mile and a half.

Q. Can you tell us, as a railroad man, about what would be the average rate per hour that the locomotives would travel along the elevated road?

A. I estimate about ten miles; I think that would be as fast as

they would ever travel.

Q. Some might go a little faster and some slower, I suppose?

A. Rarely ever faster than that.

Q. Have you made any estimate of how long it would take a train to go in front of Mr. Backus', or the locomotive, I mean?

A. Traveling at the rate of ten miles an hour, it would take a

locomotive passing his ground (238 feet) 17 seconds.

Q. Traveling ten miles an hour it would go by these premises in 17 seconds?

A. Yes, sir.

Q. Suppose the traffic on that elevated road should remain as it is now, how much time would it take every 24 hours—how long would a locomotive be in front of the property of Mr. Backus every 24 hours?

A. Nine and a half minutes a day—24 hours.

Q. I suppose it is fair to presume that the Canadian Pacific, at any rate, will put on some trains when these accommodations are furnished?

A. Yes, sir; there are 32 trains now that might come there; allowing that there are two freight trains for the Flint & Pere Marquette and the Lansing, two each, one in and out, there would be 32 trains as things are now. It is possible in time that might be doubled, the number of trains, possibly it might be trebled. If it were doubled, twice as many trains, it would take eighteen minutes for all the locomotives passing Backus' grounds—32 trains nine and a half minutes, 64 trains, if there were so many, would occupy about 18 minutes.

Mr. Dickinson: For the locomotive?

A. Yes, sir, I speak of the locomotive only.

Mr. Baker: Would double the number of trains be a fair estimate for the next five or ten years?

A. I should not think there would be so many as that in five or

ten years; at the end of ten years there might.

Q. Have you made an estimate of the amount of time a hundred

trains would take, for the locomotives?

A. Sixty-four trains would be 18 minutes; if there were twice 64 trains, that would be a little more than a 100; take 100 trains, it would be about half an hour, 28 minutes.

Q. So that if the business increased so that there was 100 trains

a day, a locomotive would be in front of this property about half an hour out of the 24?

A. Yes, sir.

Q. To what extent would the presence of a locomotive in operation on the elevated road in front of that property injure the property, or the use of it; how would it affect the property, in your judgment?

A. As I said before, when this case was before the jury before, I didn't think it would be much damage to Mr. Backus; how much, or how little, in figures, I would not like to state, but

I don't think it is a serious damage, and I don't think it is a serious damage to anybody there to have a road spanning the highway, leaving the highway perfectly open, except there is a post once in 35 feet; a post once in 35 feet before a man's land forever is some damage; any one of you can judge how much that will be; we have not considered a telegraph pole any great damage to the adjacent lot; the standing of a pillar in front of a man's lot, if he wanted to rebuild, build some kind of a building there where this post would go right in the middle in front of the building, it might be some damage.

Q. That is if he had a doorway there?

A. Yes, sir, it might be some damage; or if he wanted to back up a team right straight to the doorway, it might be some damage, but no large damage; I cannot conceive myself what other damage there is there. The danger from fire, as modern engines are built, amounts to nothing; I think that will be proved here; and anybody who is familiar with modern engines, and how they are used, I think they will know it. The damage to light, as I have shown you, amounts in my judgment to nothing; others may differ from me on that.

Q. What will be the damage from soot and cinders?

A. Soot and cinders, as modern engines are constructed, there would be some little small cinders such as get into your eyes when you are on passenger trains.

Q. As a railroad man, do you understand that a locomotive can be constructed and operated so that very little smoke and cinders

escape from it?

A. Yes, sir; they are so constructed that with the fire-box closed no smoke and cinders will come out at all; but that is not the way engines are generally run; that is the way in which

they are run when they come into cities and when they run by buildings, and where sometimes in the country they run over combustible structures like wooden bridges, then they shut up the fire-box; that prevents a draft, and that prevents sparks from coming out.

Q. Do you understand a locomotive can be operated any consid-

erable distance with the fire-box closed?

A. Yes, sir; two or three miles; it depends a little on the ground.

Q. So that, in your judgment, it would be practicable to operate

this piece of elevated road along this street without having the fire-

boxes open?

A. Entirely so; but there is no danger from fire, I don't think, with the fire-boxes all open. There would be some smoke with the fire-boxes all open, but from sparks, I think, none which would be dangerous. The fire-boxes of a locomotive are so built now that the sparks of any considerable size never get out of the chimney; they are deposited in the fore part of the locomotive, and when that fore part of deposit gets filled, at some place on the road they open it and drop them out, but with the sparks of any size, which are liable to carry heat or fire, they are all deposited there; the smaller ones, such as you get in your eyes traveling in a train, such as pass out of the small spaces of the network of a locomotive, are thrown up into the air, but they are little bits of hot coals, no flame about them, and they get cooled before they get any distance and before they drop on the ground.

Q. And the higher a locomotive is the safer it is?

A. Ordinarily so; yes, sir.

Q. That is, in falling, whatever life there is in those cinders goes out?

A. A cinder which is thrown out of a locomotive now is so small that it will be cooled before it goes 30 or 40 feet in any direction.

Q. And with the draft, with the present arrangements, they are thrown into the air with a great deal of force?

A. Yes, sir; and before they drop down to the level of the loco-

motive they are gone out.

Q. Do you think, from your knowledge of railroads and your knowledge of the property of Mr. Backus, that the fire risk will be increased there?

A. I don't think it would a particle.

Q. Have you looked into the matter of this recent ordinance in regard to smoke?

A. Yes, sir; I have got it here (producing it).

- Q. I suppose you expect to operate your road subject to the ordinances of this city?
- A. We have to do it. Our men who operate them would be sent to the house of correction if they didn't.
- Q. That ordinance, as I remember it, provides that you shall not emit any smoke or cinders?

A. Shall I read it?

Q. Yes, if my brethren have no objection.

Mr. Dickinson says he has no objection, and Mr. Joy hands the

ordinance to Mr. Baker, who reads it aloud as follows:

"Section 1. The emission from any chimney or smokestack within the city of dense smoke or smoke containing soot or other substance in sufficient quantity to permit the deposit of such soot or other substance on any surface within the corporate limits of the city, shall be deemed and is hereby declared a public nuisance.

Section 2. Any owner, agent, lessee or manager of any 214 building, boat, locomotive or structure in the city of Detroit who shall cause or permit dense smoke or smoke containing soot or other substance as above to be emitted from such structure or from any other place, which said soot or other substance shall damage the property or injure the health of any person, or shall especially annoy the public, shall on complaint of any person so damaged or injured as aforesaid, or on the complaint of any citizen or officer of the city in case of especial annoyance, be liable for each any every such offense to a fine of not less than \$10 or more than \$100, or to imprisonment in the house of correction for not less than ten or more than thirty days, or both such fine and imprisonment in the discretion of the court, provided that the provisions of this ordinance shall not apply to a place used exclusively as and for a residence or steamboat."

Q. I suppose it has been customary upon roads in this city to use bituminous coal?

A. Yes, sir.

Q. Have you had any consultation with any of the officers of these roads with a view of complying with that ordinance, and for that purpose to change the coal that will be used?

A. When I saw that ordinance sustained by a decision of the

supreme court as a valid law-

Q. Our supreme court has recently sustained that, as you understand?

A. Yes, sir, they have declared it to be a valid ordinance. When I saw that I called the attention immediately of Mr. Heald, of the Lansing road, and of some others to it. I have not an answer from some of the others, but I saw Mr. Heald, the general manager of

the Lansing road, yesterday. He said of course they would have to comply with the ordinance, and they would have to introduce locomotives that would burn either coke or hard

anthracite coal.

Q. Would there be any practical difficulty in doing that?

A. None at all, except they would have special engines here to run the trains from Delray up to depot grounds and back again, taking off the locomotives which would bring the trains to Delray, and putting on a locomotive which would run back and forth with trains to that point.

Q. Is not this true, that practically the only difference between using bituminous coal and anthracite coal is a matter of about \$2

a ton?

A. It is about that. The result of that ordinance will be the use

of a different kind of locomotive; that is all.

Q. In managing the trains and business of the union depot company, in the management of the trains of these four different railroads, would there be any practical difficulty in having locomotives designed for the use of anthracite coal or coke, so that you could bring the trains, the cars, in over this elevated road with such engines? A. No difficulty at all. It would be a little bit inconvenient only to take a locomotive off down at Delray and hitch on one of the locomotives which would belong to the depot company for doing that business; they would burn hard coal or coke, and they would haul the train out to Delray and there let the regular locomotive take it, and haul the trains in in the same way. That is what they would have to do under that ordinance.

Q. And your attention has been called to the necessity of doing

that by this recent decision of the Supreme Court?

A. I showed it immediately to the manager of the Lansing road.

The others I have not been able to get at yet. He said they
216 will have to do that and be compelled to do it, and glad to
have it, because it will have a tendency to clear away a great
deal of black smoke in the city, which comes out of a great many

chimneys here, which ought not to be.

Q. With the road operated in that way, operated properly, with the dampers closed along this trestle-work in front of the property of Mr. Backus and the other property along the street there, would the use of the adjoining premises be in your judgment seriously affected by the presence of the road?

A. I don't think it would at all.

Q. I suppose in your time the character of the property down there has changed materially?

A. Yes, sir.

Q. What used to be along the river years ago when Judge Chip-

man was a boy?

A. When I first knew it, many pleasant residences were along there, looking out onto the river. There is an old house now standing out there which was once quite a fashionable residence. It is all going to decay now. There was nothing between it and the river, and all the other houses fronting on the river were very pleasant. That is all passed by. Then it became a kind of business street and remained so until the Michigan Central business increased to such an extent that they found themselves under the necessity, as they say, of eneroaching on that street, until they have got 13 or 14 tracks across it, practically breaking the street in two. From that time the property has gone to decay all along there.

Q. Why did the Michigan Central go down there; why didn't

they stay here on the site of the city hall?

A. When it was here it was owned by the State, and the reason it was placed here was because at that day every farmer in the country who had a barrel of flour to sell brought it to Detroit.

Q. Brought it in on wagons?

A. Yes, sir, and he sold it to the men who had warehouses on the dock; the dock was lined with warehouses from one end of the city to the other; in the winter they used to be filled with grain, with flour, with everything that a farmer had to sell, and in the spring that used to go off in the boats; there was no road on the other side; every teamster in the city made money by hauling the flour from here down to the warehouses. Every teamster was interested in

keeping it here; every warehouseman was interested in keeping it here; they got it located here; they fought for it here. When there was a good deal of a move to take it away, they had influence enough to get a railroad built right down Woodbridge street, right clear down to the river front; it was built by old Mr. Palmer, the father of Senator Tom Palmer, but it never could be used; a locomotive running down there would be apt to run off into the river; they had no means of running that freight down there, and they had no means, and after a year or two it was taken up. Well, when the Michigan Central was organized—

Q. How was that organized? You say the State owned this rail-

road, and tried to run the railroad, and they got bankrupt?

A. Yes, sir; they became utterly bankrupt, and wanted to sell. Q. Did you have anything to do with selling that road?

A. Yes, sir.

Q. Just explain that.

A. When that charter of the company came to be formed and discussed between us and the legislature, this question

of terminus came up; every warehouseman and every teamster in the city was against any change; every farmer who lived in the country said it cost too much to reach Detroit, and they wanted to reach the river; therefore, they said, if we sell you this railroad there must be a clause in that charter which must provide that you must go to the river at some point in the city of Detroit, not further than 6,000 feet away from the foot of Woodbridge street. They put that in for the purpose of saving the expense of transferring their flour and grain from wagons and teams into warehouses and then onto boats. It would go down there, and go from a warehouse or elevator onto the boat, when navigation was open; when navigation was closed it would go right in the warehouses; there would be no expense for teaming or warehousing; that would be free; it was the necessities of the farmers in the country compelled that.

Q. So the members from along the line of the Michigan Central

forced that in?

A. Yes, sir; because that was of immense importance to them; it saved them on an average, including teaming and storage during the winter, easily \$1 a barrel on the flour.

Q. How much ground did they get down there?

A. We bought the ground from Third street down to the east side of Gov. Woodbridge's farm, the easterly line of his farm; it was a distance of perhaps not more than one-half of what the Michigan Central has got now in length; the road ran across the water in front of Gov. Woodbridge's farm on piles, it didn't go by the front of his farm; we thought down west of the farm would be all we would ever want, and they ran the road down there by his farm and then turned off to go through the country; it might

and then turned off to go through the country; it might 219 have been one-half the length of the ground which they

have got there now; I think not more than that.

Q. Did they acquire any additional ground while you were president?

A. Yes, sir; they acquired most of it when I was president. The Michigan Central business had become so large that it was impossible to do it on those grounds, utterly impossible when I was president; the next 150 feet I bought, and then the next 100 feet perhaps, I cannot tell just exactly how much there was, but a considerable portion of it was condemned by the Lansing, after the present company came in, the lots which adjoin Twelfth street now, 50 foot there perhaps, I don't think any more, but there might be 50 feet there that the present managers obtained; all the rest of it I obtained.

Q. Will you state whether that was necessary for the transaction

of the business of that company?

A. At that time we had only these yards here and it had become impossible to do the business. In those yards were the shops, their blacksmith shops and locomotive and repairing shops were all in the yards, their car-repairing shops were all in the yard, and the repairing was done there; but the business had become so great that I was compelled to remove those shops to the junction here; the engine shops were put out at Jackson by the order of the board; that was where the two branches of the road came together, and they thought that was the proper place for the engine-houses; but they had all to be taken out of this yard; but while I was there the business increased so rapidly that the yard was not then sufficient, and I was compelled to acquire additional ground, and I ac-

quired 50 feet on Twelfth street, I think, and Mr. Ledyard bought the rest. The business has doubled and trebled since that, and the consequence is those yards won't do their business; they are crowded all the time, and they cannot half do their business, and the result is that they have been compelled to acquire out at the junction perhaps 100 acres of land on which they have perhaps 100 tracks stretching for three-quarters of a mile in length, where they make up and distribute their trains; but still these yards down here are so crowded that they have laid their tracks all

along there; we had 150 feet right of way.

Q. It is practically one railroad from there to West Detroit?

A. Yes, sir; and they make Woodbridge street a part of their yard, and clear out.

Q. Is all that property down there in actual use by them?

A. Every inch of it. Q. Used daily?

A. All the time.

Q. Is it necessary for them?

A. I think every inch is necessary, and if they could get more they would get it, and because they cannot get it there they are compelled to go out.

Q. Their use of River street, as a part of their railroad yard, was

a part of the controversy between these two companies?

A. Yes, sir; I don't think they have a right to use a street as a yard anywhere.

Q. That was the position you took before the State railroad crossing board?

A. Yes, sir.

Q. Just describe the difference between a railroad yard and a railroad.

A. A yard is a place where the trains are made up and where they are distributed, and where all the switching for the making up and distributing of trains is done; a yard is for that purpose; that is what they call it a yard for, for their cars and their locomotives, and when they distribute their trains they have their switches in their yards, or should have, and do it all there. The yards of the Michigan Central, with all the grounds they have, have become too small, and they cannot do it there. Therefore the next resort they resorted to was to extend their yard out across Woodbridge street just as wide as they could extend it, by putting all those tracks down there, and they do a large part of their business out there now across that street, and that is what has destroyed that street, and it ought not to be; no street nor the property in the vicinity of any street like that should be destroyed by any such work as that.

Q. About now much land has the old union depot got at the foot of Twelfth street?

A. Now, about 40 acres.

Q. About how much of that is made land?
A. Something more than 20 acres of it.

Q. About half of it?

A. Yes, sir.

Q. I suppose, on the Michigan Central property, there is a large amount of made land?

A. The whole of it.

Q. The margin of the river originally came up to River street? A. Yes, sir; that was located in what was originally the river.

Q. That is, the river washed the highway there?

A. Yes, sir, all along there; there was nothing between the ground and the river at all.

Q. Is there any more ground at the foot of Twelfth street, on the 20 acres of natural land and the 20 acres of made land, than is necessary to transact the freight business of these four

railroad companies?

A. No, sir; there is not enough to transact their business. We have to do it now out at the yards of the Wabash at Delray. We have there 20 acres of land on which they do largely the making up and distribution of their trains, as they will have to do it all by and by, and all these companies will have to acquire land outside, because in the yard proper, including the grain which is to be handled there and the coal which is to be handled and distributed there and teamed out, and other things which will come there, and the switching necessary to be done there, we will have to occupy all that ground as the Michigan Central is doing, and we will have to go out like the Michigan Central and get land for this business.

Q. You designed to use the 40 acres as a freight yard?

A. Yes, sir.

Q. Where trains can be loaded and unloaded?

A. Yes, sir; and it will come to be as necessary to use every inch of that ground as the Michigan Central is today, as business grows; that is inevitable.

Q. Will the two and a half blocks of land at the corner of Third street and Fort street west be any more than is reasonably necessity for a passenger bayes and a small freight bayes?

sary for a passenger-house and a small freight-house?

A. No, sir; we could not get along with less.
Q. How long will the small passenger-house be?

A. The building will be about 25 feet from Third street, on the west side of Third street, so as to leave an open space between it and the street; then the main building will be on the

block between Third and Fourth streets; but there will be a long building for handling baggage, for express business, and for other business connected with a railroad business—perhaps a restaurant, which will stretch down into the next block, I don't remember just how far, but it will go into the next block perhaps 40 or 50 feet.

Q. So that that will have to be built right across Fourth street?

A. Yes, sir; it will go down into that block.

Q. I suppose you have examined these plans and know whether they are practicable and sensible for what they are for?

A. We have got the best that all our experience has been able to

give us.

Q. I suppose you intend to have all the modern conveniences of

a first-class depot there?

A. We mean to have a good depot there, which will accommodate the people of the city and the country and everybody that wants to do business with these roads.

Q. What would you say as to the location being one that will

accommodate the public of this city?

A. I think it is the best one that can be found; it comes to the center of the city where the hotels will be and must be, near where the post-office is, and near the business portion. I cannot imagine any more convenient place in any city than this for a passenger building.

Q. Of course you have in view the change that will take place in

this vicinity by the construction of the new post-office?

A. Yes, sir.

Q. So that the depot, with reference to future hotels and business

part of this city, will be particularly advantageous?

A. That is the object. It is for this: A man comes from the country along the Flint & Pere Marquette road or the Lansing road, with his wife and children, the whole family, perhaps; he has got to go to some hotel; he does not want to ride a mile and a half or two miles to get there; it is convenient to bring him right into the city; if he is alone he can take his grip-sack and walk to his hotel; if he is with his wife and children and family, and he wants to go to a hotel, he has but a little way to go, and whether it rains or blows or snows, or anything of that sort, he is not subject to a long passage on a dark night to get to his hotel, it is but a short distance; that is for the convenience of every man in the country

who comes to the city, and for every man who comes with his wife and children, and for every man who goes with his wife and children to a watering place, like Mackinaw; he does not want to go or come a long distance on a stormy night; therefore it is for the interest of the city, and for the interest of the country and everybody, to have a passenger depot, which has got to be used for a thousand years, perhaps, for a hundred generations, convenient for the people of each generation; and you cannot estimate the value of a depot at all as a public convenience, to everybody that wants to do business with the city, to come to a city or to go from a city, because it is to last perhaps forever, and to be a convenience or inconvenience to every generation that comes; and therefore it should be in the best place that can be found.

Q. In your opinion, would it be practicable to build a railroad to connect these grounds with the old union depot grounds, by constructing a road through the private property—through Mr. Backus'

property and through the Peninsular stove works' property?

A. I could not get strength enough to do it. I don't think it would be expedient, anyhow, to do it. It would cost more than the railroad companies could afford; we could not get money enough to do it, and it would be an unnecessary destruction of

property.

Q. I suppose you have a pretty good idea of what that property

is worth in there?
A. I think I have.

Q. You have lived on Fort street down toward that property a good many years?

A. Thirty-odd years.

Q. And you have been familiar with the value of real estate in the vicinity of the Michigan Central depot ever since you were connected with the road?

A. Yes, sir.

Q. Ever since 1846?

A. Yes, sir.

Q. I suppose you have bought considerable property in that vicinity?

A. Yes, sir.

Q. What is the situation of the property on the new union depot grounds themselves, with reference to their acquisition by the company—the Fort Street West union depot grounds?

A. They have bought it all.
Q. Bought it or condemned it?

A. Bought it or condemned it. I mean we have acquired the title.

Q. You have acquired the title to two and a half blocks?

A. Yes, sir. You spoke about the necessity for that; I will explain. Now, a yard for a passenger train has to be long enough for a whole train of cars coming in, and a little longer, because sometimes you want to go out, and to have two or three trains occupy the yard at the same time; when you take off from the front there what you want for a passenger-house, a long passenger-house, as long passenger-house.

senger train would stretch the whole length of that yard; it is only about 1,000 feet; it ought to be a good deal longer; with 1,000 feet we can get along; I don't think we can get in that vicinity any more land; so that the three blocks which we acquired there is no longer than we want for a single passenger train, but there will be four companies in there, and they will spread out so that there will be four tracks, so that the four can occupy the ground at the same time, and it can be used for more companies, in and out, because they don't stay there all the time; but you must have a certain length and width of ground and the 1,000 feet that we have got there is as little as we could get along with. I don't know of any company in any city where there is any less. I know they could not get along, where there was any considerable business, with any less.

Q. To what extent has the company acquired the property from

those grounds down to River street?

A. They have acquired pretty near all the ground; had to buy

them all, down to Eighth street.

Q. That is, the right of way through that property, through the private property, down to Eighth street, at the corner on River street, has been acquired?

A. Yes, sir.

Q. To what extent has the company acquired the right of way along River street?

A. With the exception of this case and two others, the match company and the stove company, pretty much all of them.

Q. The Michigan Central owns all the property on the

south side of the street, and a portion of it on the north side?

A. Yes, sir; we have acquired the right of way from them on both sides.

Q. By condemnation proceedings?

A. Yes, sir.

Q. Have you acquired the right of way through the property owned by Mr. A. D. Boynton and a man of the name of Boutel?

A. We have acquired from Boynton—I think we have acquired all that down there with one exception; I think there is a piece of property belonging to an estate which was sold at auction here, and a Mr. Barbour bought it.

Q. I will take these up in their order. Here is the first property in front of which this elevated road is to be constructed; at the west end of this street, River street, is the property of Mr. Boynton?

A. That we have acquired.

Q. Do you remember how much a foot was paid for that?

A. I think we paid \$20 a foot for that.

Q. That was by voluntary arrangement?

A. Yes, sir.
Q. The elevated road does not get fully into the street in front of that property?

A. No, sir.

Q. The next piece of property is that of Catherine Harpfer; that has been acquired by condemnation proceedings?

A. Yes, sir.

. Q. And the next piece of property is that of Mr. and Mrs. Ruhlman; that was condemned?

228 A. The same way.

Mr. Baker: That is property that is situated on the north side of the street, like Mr. Backus. I am commencing at the further end, this side of Twelfth street. We have acquired the right of way in front of that property. Boynton has some sort of a little factory there. Catherine Harpfer has a residence there. Mr. and Mrs. Ruhlman have residences. We have acquired the right of way in front of it to build the elevated road in front of it, just as we want to acquire of Mr. Backus. Under the law a common council can authorize a railroad to be built in a street, but the company must condemn a right of way as against the abutting property-owner, or buy it; they can buy the right of way or they can condem it to have the right to run an elevated road in the street, the owners retaining the ownership of the property. The next property on this map is the property of John Wymaster, at Howell, who died recently?

A. That is not settled yet.

Q. You made a bargain with a Mr. Bennett for it?

A. Yes, sir.

Q. And that is in process of adjustment?

A. Yes, sir.

Q. The next property is that of Margaret Specht, now known as Margaret Ruchlin?

A. That was taken by condemnation; I think they gave us a

deed afterwards.

Q. Most of these, after the jury rendered their awards, they give a deed and take their money?

A. Yes, sir.

Q. The next property is that of Barbara Baxter, now owned by James A. Randall?

229

A. We bought that: we paid \$40 a feet to go in front of that

 A. We bought that; we paid \$40 a foot to go in front of that property.

Q. The next property is that of Margaret Specht, acquired by condemnation?

A. Yes, sir.

Q. The next is that of Louis J. Specht, acquired by condemnation?

A. Yes, sir.

Q. And the next property is that of Barbara Steadley, acquired by condemnation?

A. Yes, sir.

Q. Those people have all accepted an award?

A. Yes, sir, and all been paid.

Q. And the right of way deeded to the company?

A. Yes, sir.

Mr. Baker: That is, it is all acquired from the commencement in the street at the west end up — the property of Mr. Backus; they have clear to the property of Mary Specht, which is a small frame building right on the Michigan Central property; that has not been acquired, but the case has gone over until next fall, under an arrangement with the counsel of Mrs. Specht (Mr. Conely), who is going to Europe, and it is in the same position as the Peninsular stove works. The next property is the Michigan Central crossing, which has been acquired by condemnation proceedings, and in addition to that there is 166 feet on the corner of Tenth street, where the flour shed is, with a track in there, and it is used as a place for distributing flour. There is 166 feet of that; that has been acquired?

WITNESS: That has been acquired.

Mr. Baker: The Michigan Central condemnation involves some other things, upon which we will introduce evidence in

full. Then, crossing Tenth street, you will remember, gentlemen of the jury, there was a saloon on the corner of Tenth street, kept by a man named Frank Hildebrand, and next to that is property that belongs to Mr. Barker, one of Barker Bros., the furniture men; and the next piece of property is 25 feet, belonging to George C. Wetherbee, the woodenware merchant; and the next piece, 100 feet, belongs to George Kunze. The company has acquired the right to build an elevated road in front of all that property?

A. Yes, sir.

Mr. Baker: I may state in this connection that this same property has been purchased by the Peninsular Stove Company since at figures which will be given in evidence here, as bearing upon the value of this property. The next property is the property of the Peninsular Stove Company, which has a frontage on the street of 298 and $^{10}_{100}$ feet, within a foot and a half of 300 feet; in that case a stipulation has been signed between counsel, Mr. Edwin F. Conely representing that company, by which they consent that the road be built, that the superstructure be put up there, and that the damages be assessed afterwards, next fall some time.

Mr. Dickinson: To this we object, and protest against it, and we take an exception.

Mr. Baker: Certainly. That is, as far as the necessity is concerned, we have practically acquired it. They have agreed that we go on and do the work, and it will be put up there, and then we will find out what the damage is; they will know more about it, and it will be a plainer case, and they are willing to have it that way, at any rate, and their lawyer is going to Europe in the mean-

time. The next property is the property of Faxon, Williams & Faxon, the Union mills; the right to construct it in front of that mill, which is a large flouring mill with the most improved machinery in it, has been acquired by the verdict of a jury in that case, in which the defendant was represented by Mr. Don M. Dickinson.

Mr. Dickinson: Will you state the amount and their frontage?

A. The amount, including the injury to their business, for 140 feet, was assessed at \$21,250, made up mostly of injury to their busi-

ness as flour-makers. The next property is the property of the Diamond Match Co., and that company is now represented by Mr. Dickinson, and it has been in process of adjustment, but has not been adjusted, and we may possibly have to try the case.

Mr. Dickinson: To this we object and take an exception.

Mr. Baker: The next property, and the only remaining parcel of property on the street, is the property of George H. Hammond, who has a meat-refrigerator building there in which he stores beef; the right has been acquired to build the road in front of that property. They go right close to that building in making the curve to get off the street.

WITNESS: We paid him and got a deed from him.

Q. As you have already stated, you have acquired the right of way clear up to the ground?

A. Yes, sir.

Q. And you have got all the ground?

A. Yes, sir.

Q. And the contract has been let for the construction of the building?

A. Yes, sir, and the work is going on.

Q. When does that contract provide that the work shall be done?

Objected to as incompetent, and an exception taken.

A. We expect to use the ground this fall; the whole building will not be done, but we expect to use it this fall of all of these companies.

Q. Are you engaged in the active work of constructing this

elevated road?

Objected to as incompetent, and an exception taken.

A. All the work is in contract and in progress.

Q. When do you expect to have it done?

Objected to as incompetent, and an exception taken.

A. The elevated road we expect to be finished in September; we do not expect the passenger grounds to be finished quite so soon, but we expect in October to use the whole, although the building won't be done, but we will have enough generally to accommodate the passengers for the time being, and we expect to use it this winter.

Q. I would like to know whether the company has gone on raising the money and paying it out to complete this work just as soon as it can be done in a proper business-like way?

Objected to as incompetent, and an exception taken.

A. Yes, sir, just as soon as it can be.

Q. And each of these four companies, with the exception of the Wabash, is furnishing one-quarter of the money?

A. Yes, sir.

Q. And yourself and your associates in Detroit here are furnishing the Wabash's share?

A. Yes, sir.

Q. From your knowledge of the Backus property, the situation down there upon that street of all the property along

there, can you tell us what the Backus property, adjacent to the Michigan Central railroad there, with just a small lot between it, on the street, and the Michigan Central and the spur of the Michigan Central running right down alongside of it, is worth; what is the market value of that property, supposing it was vacant property, the land itself, per foot front on River street?

A. It would be worth about \$150 a foot for that iront, half way

back to Fort street.

(). What would the Fort Street front be worth?

A. I don't think the Fort Street front would be worth quite so much as it would be down there.

Q. What is the property worth just west of it, between there and

Twelfth street?

A. All the property west of it, until you get down to the corner, would be worth \$80 to \$100 a foot. \$100 would be a high price for it, and \$80 would not be a very low one.

Q. What do you base those estimates upon?

A. Actual sales and my knowledge of it for a good many years.

Q. Your estimate is based upon sales that have actually taken

place down there?

A. Yes, sir, principally. I have had negotiations for almost all of it; a great many of them have been to me to sell it; I know what they have asked for it; I have attended auction sales and bid for some where there were several competitors; some of it I know to have been sold, and know what it sold for, and, taking it altogether, the prices that have been asked and the sales, it would be from \$80 to \$100; no higher than \$100, anyway, and possibly not lower than \$80.

Q. Why do you put Mr. Backus' property at \$50 a foot

higher?

234

A. Because it is convenient to the Michigan Central road and it may be used for manufacturing purposes a little better than the rest.

Q. Why does that make it more valuable?

A. There is a railroad to it.

Q. I thought a railroad damaged the property?

A. I think you will find everywhere in this city that manufacturers are going right around the railroads.

Q. You mean to say that his property is worth something more because he has side-track facilities with the Michigan Central?

A. I think it is worth one-half more on that account; it would be worth \$100 without that, and it would be worth \$150 with it. I think Mr. Backus went there because the railroad was here, as any other manufacturer would.

Q. Have you had any experience, or have you got any knowledge

as to the value of property this side of the Michigan Central

crossing?

A. Yes, sir; this side of the Michigan Central crossing the property is worth a little more, because it is a little nearer to the city, and you can get to it from the city without going across the Michigan Central tracks; it is, therefore, worth a little more.

Q. That is, property this side of there, which can be reached without going across the Michigan Central crossing there, on the north

side of River street, is a little more valuable?

A. Yes, sir.

Q. Have you had any experience in negotiating the sale of property along there?

235 A. I have bought property all along there.

Q. So you know what it is worth?

A. Yes, sir.

Q. About what is that worth per foot front along there, say at the corner of Tenth street?

A. For 125 feet there I paid \$13,000.

Q. A trifle over \$100 a foot.

A. Yes, sir; running back, however, deeper than this property below on the other side; that has got no buildings on it.

Q. Vacant property?
A. Yes, sir. I bought property that had buildings on it, but the only vacant property I bought was that 125 feet, and I bought that for \$13,000.

Adjourned to Wednesday, June 17, 1891, 2 p. m.

WEDNESDAY, June 17, 1891—2 p. m.

Direct examination of JAMES F. Joy continued by Mr. BAKER:

Q. The Wabash road had a terminus at Toledo?

A. Yes, sir.

Q. Before the Butler road was built?

A. Yes, sir.

Q. The construction of the Butler road gave the Wabash two termini at the east end of their road, one here and one in Toledo?

A. Now it does; yes, sir.

Q. Where does the Wabash road run; what part of the country does it pass through?

A. It runs from Detroit to Toledo and St. Louis; it runs from St. Louis to Kansas City, on the Missouri river; from there it runs with a branch, leaving it this side of there, running 236

up to Omaha, on the Missouri river. It runs also to Chicago, both from St. Louis and from Detroit. I will state a little more definitely the history of our connection with the Wabash here. was a project which came before the board of trade here and the people of Detroit, to build a road from Detroit to Hillsdale and a little west of Hillsdale, connecting there with a road coming down from the Jackson Valley, which had also been promoted by the Michigan Central Company, running down to Fort Wayne, the

object being to reach the Wabash in that direction. It was an irregular route, but that was the object of it, and that road was built, but it was premature. When it was built the road at Jackson was managed by a man at Jackson, in the interest of Jackson, and they found it could not make the needed connections to reach the Wabash road in that direction, and the result was that the Detroit & Hillsdale road failed and was sold, and it fell into the hands of the Vanderbilts; the Lake Shore bought it. That defeated the project which people here had of connecting with the Wabash at that day; but before that failure was thoroughly made, and they found they could not make use of that road to run here, connecting with the Wabash, the people here, at the head of whom was Chris. Buhl (perhaps I also was interested in it) and others, undertook to build the Eel River road. So having failed to use the Fort Wayne road and Jackson road, they thought they would have a road of their own. They built that, but failure of the road at this end broke up that. The result of it was, the Eel River road was built from Butler down to Logansport, connecting there with the Wabash road. There had been 237 planned also what was called the Chicago & Canada South-

ern road, and that road failed also, but they had built from Trenton down here 72 miles, in the direction of the Butler road, where the Butler road was afterwards built. We tried to buy that 72 miles; but before that road went into the hands of receivers, Mr. Dillon, of New York, was the president of it. The Eel River road was built up to Butler, and it was about 30 miles from the termination of that road over to Butler. That road built there would give us a very good connection with the Wabash road. If it were necessary the 14 or 15 miles between Trenton up here could be built. We tried to buy that road—no, first Mr. Dillon agreed to be at a joint expense with us to put in the 30 miles. They agreed to furnish their share, and we agreed to furnish ours, but in a few days after that was done Mr. Dillon notified Mr. Buhl, who was then at the head of it, that Mr. Vanderbilt had bought the majority of the bonds of that road, and would ultimately get control of it, and he could not carry out his agreement; so that was broken up. Then we tried to negotiate directly with Mr. Vanderbilt. He foreclosed his mortgage and got control of that property. It was no use to him in the world, but it would be a good connection between Detroit and the Wabash road, almost as direct as the Butler is now; there may have been a mile difference, perhaps. At the request of parties of the Eel River road, I took up the negotiation with Mr. Vanderbilt, whom I knew very well; and it had cost him \$750,000, as he said. I asked him if he would make a proposition to sell it to us for that, so that we could make a connection with the Eel River road. He didn't say that he would or that he would not,

but it became pretty important that we should act, and we did not want to build this road from here to Butler if it were not necessary. Finally I telegraphed Mr. Vanderbilt, who was at Saratoga, saying to him that we would give him \$750,000 for that road, and wishing him to make a reply. He made a reply back

to me, saying the proposition was worthy of consideration; but instead of of letting us take it, he took my telegram to the Lake Shore road, the board of which was then in session at that place, and showed it to them, and he says, "Now, if you want to buy this road to keep it out of the hands of these people at Detroit, you shall have it at the same price," and they accepted his proposition, and they bought that road. So we were let out again. Then there was no alternative in the world to get connection with the Wabash except to build the Butler road. That is the history of the beginning of the Butler road.

Q. What was the object of making the connection with the Wabash?

A. To bring the business here, to open a communication with a large section of the country, reaching west as far as Kansas City and Omaha. It runs through the best section of the United States, probably, and we wanted to bring here as much of the business as we could, as much as fair competition would enable us to do.

Q. Is the country that the Wabash runs through a desirable

country to connect with this city?

A. The Wabash runs through, perhaps, for the extent of it, the most fertile country there is in the United States.

Q. It runs right through the corn belt?

A. Yes, sir, and runs through Indiana and Michigan in the wheat belt, and Missouri in the wheat belt as well as corn belt, and is, to take the extent of it, tributary to one road, perhaps the most productive section of the United States.

Q. The building of that road necessitated the construction of an

elevator at the old depot grounds?

A. Yes, sir.

Q. There is a large amount of wheat and oats and corn handled there?

A. I think during the season, and during the time that road has been running, except perhaps the last year, when the crop was short, the Wabash has brought into this city as much grain as all the other roads together.

Q. That is, you have handled as much down there as has been

handled by all the other roads?

A. Yes, sir.

Q. This line up to Toledo, does not that make Toledo a competing point for this business?

A. Yes, sir.

Q. In fact, Toledo is a competing point for Western business, and

also for Michigan business, is it not?

A. I will tell you how that is. The Lake Shore road is a strong corporation now, perhaps the strongest in the United States. The Lake Shore has built its road from Toledo up to Lansing—Battle Creek, Lansing; it has built a road from Toledo up to Grand Rapids, right up northwest of this city; the Toledo & Ann Arbor has been built from Toledo straight up, clear up through Michigan, and may go as far as Mackinaw. Those roads are spread all over west of us, and the cities are competing with us, and the roads are

competing with us. What we get now in Michigan we have to fight for as against competition, not only southwest, but all over our own State. Therefore, it is that the utmost accommodation should be given for business in every possible way, because

the cities are competitors, as well as business men and rail-

roads are competitors with it.

Q. And in the strife the successful one will be the one that has the most advantages and the most convenient facilities for doing business?

A. Yes, sir.

Q. The Grand Trunk has a line that runs through from Chicago to Port Huron?

A. Yes, sir.

Q. And the Flint & Pere Marquette has a line that runs from Port Huron over to Saginaw?

A. Yes, sir, an outlet at Port Huron.

Q. And a large amount of business is done that way?

A. I presume so, but I have not definite knowledge of that, but the Flint & Pere Marquette runs that way; the Grand Trunk runs through the Northwest and Southwest, and Detroit has got to fight for what it has got, and should the business accommodations be poor, it is at a disadvantage; it should have the business accommodations which it is possible to give for the business.

Q. Do you think the present enterprise, the construction of this depot, and the maintenance of a first-class freight yard at the foot of Twelfth street would increase the advantages of the city

of Detroit?

A. It is one of the elements that will give great advantage to the city, both for passengers and such freight as the city wants to deal in.

Q. But with a passenger-house on the corner of Third street, and a small freight-house for the accommodation of two of the roads, it is also proposed to operate the old union depot ground for heavy freight?

A. Yes, sir.

Q. So that there is only about one-half of those grounds used now?

A. That is all now; there will be more next year.

Q. And these new companies, the Flint & Pere Marquette, the Detroit, Lansing & Northern and the Canadian Pacific, come to those old grounds partly because they can get good freight facilities?

A. They come up to the new ground for passenger facilities and for the city package business, and they come to the old ground for

facilities for freight business.

Q. Can you tell us whether or not they would be willing to come to those old grounds and go out of their present quarters if the new union depot was not constructed?

A. They would not come there if they were not driven out of

their old quarters.

Q. That is a part of the inducement that brings them—the proposed new union depot?

A. Yes, sir; that gives them facilities for passengers equal to any other, and down yonder freight facilities equal to any other, but the passenger is very important for those roads; they do a large passenger business, and will reach all parts of the State almost.

Q. You own some property, or the title is in your name, on the

corner of Twelfth street and the River road?

A. Yes, sir.

Q. How many feet front has that on the River road?

A. Seventy-two feet front.

Q. And how much on Fort street?
A. Seventy-two, the same width.

Q. Does it extend the whole length of Twelfth street?

A. Yes, sir, 300 and odd feet, 310, or '20 or '30.

Q. Will you state the circumstances under which you acquired that property and what it was acquired for?

A. We employed Daniel Scotten to buy that property. employed a man named Eli Barkume. I don't think Mr. Barkume managed it very well, but perhaps he did the best he could. He went down there and let everybody down there who owned property know that he wanted to buy that property. They said they didn't want to sell. He said, "I want to buy, and I must have it. What will you take for it?" Under those circumstances they put on a good round price. He came to me and told me what he was doing, and he told me, under the circumstances, the least he could get it for was \$27,000 for the whole of it, bought of several parties. had not made a trade for any, but he told me what he had been doing and how he had got the offer; he had found it very difficult to get it and could not get it until he got them all together and let them know that he wanted the whole 72 feet. We wanted that property, not for the property itself, but so as to be able to put 12 or 15 feet of it into Twelfth street; that was a street leading down to the old freight and passenger grounds, and as we had them then we would want a wider street than the present narrow one, and I said to him, "If you cannot do any better, although it is a great deal more than it is worth, we will have to take it, because we cannot widen that street without -;" and we took it at the price they had offered it at.

Q. Was it situated so that you could condemn it under the power

of eminent domain?

A. No, sir, we had to get it by voluntary purchase and had to pay whatever they asked.

Q. Do you regard the price you paid for that as any fair criterion

of the value of the adjoining property?

A. I do not. I am sure that we paid a good deal more than it was worth, because the necessity existed and we could not get it without paying it. If he had taken time and bought one at a time without letting the others know that he wanted it, he might have got it for a reasonable price, but he went to them all and said, "What will you take for that property; we want that property;" and they asked more than it was worth, I think.

141

Q. Is there anything more you wish to state on your direct examination?

A. I don't think of anything.

Q. One of the jurymen inquires in regard to the question whether any more roads from Toledo will use this depot? Will you state what you know about the Pennsylvania Central or the Hocking

Valley, or any of those roads coming here?

A. I cannot tell you certainly about that. The Pennsylvania Central road a little more than a year ago had an agent here looking over those old grounds down there, and he stated he would like to lease them—didn't state it to me, but stated it to Mr. Ellis, I think, some party connected with us; whether they really meant that or not I don't know; but I said to him, "Those cannot be leased to them there, because they are leased to the Flint & Pere Marquette and the Lansing roads; if they want to come to this city they can come to this passenger-house, and they can use those grounds I have no doubt, but they will have to make an arrangement with those parties down there now. They can make an arrangement with the Wabash to use part of this ground, I know." How much there was in that I don't know, but I went to Philadel-

phia to see Mr. Roberts, the president of the company, to ask him about it, and to learn whether he wanted to come here.

him about it, and to learn whether he wanted to come here.

Mr. Roberts is a very cautious, deliberate, conservative man; he said to me, "Mr. Joy, we have considered that question; we would like to come to Detroit, but we have come to no resolution, and I cannot say any more than that to you now." So that was left in that way. Now there have been other parties within the last year to me to know whether a road from Toledo could find access to this depot, and I said, "Yes, any road from there out can;" and he wanted to know on what terms; but I said, "When you are prepared to come, and it is certain to be built, come to me and I will do what I can for you." That is the way that stands.

Q. There are two roads to Toledo from this city now?

A. Yes, sir.

Q. Both controlled by the Vanderbilts?

A. Yes, sir. The Butler road never would have been built if we could have made any arrangement whatever for the Wabash to use one of those tracks to come to the city of Detriot. They negotiated with Mr. Vanderbilt to see if they could get the use of one of those lines, but he would make no proposition and no terms, and we could not get from Toledo over either of those roads. Then the Wabash came to me to see if we could not get the Butler road built.

Q. So that from a railroad standpoint, as a railroad man, you can say to the jury that as far as the use of one of those tracks are con-

cerned, it is not practicable to obtain it?

A. I know that. I know we could not then; I don't imagine anybody can now. I think the roads between here and Toledo are the best pieces of property Mr. Vanderbilt has got. I don't think the New York Central or the Lake Shore or the Michigan

245 Central, any of them, earn as much clear profit as the roads between here and Toledo—on their cost.

Q. So that if the Pennsylvania Central or the Hocking Valley, any of those Ohio roads, want to come up here, it will have to be by an independent line?

A. Beyond all doubt.

Q. And if they obtain the proper depot facilities here, it would have to be independent of the Michigan Central?

A. Beyond all doubt.

Q. And in all human pro-ability, independent of the Grand Trunk?

A. Oh, yes. That is upon the other side.

Q. The Wabash is a competitor of the Grand Trunk?

A. Yes, sir.

Q. You refer in your testimony to the route to Chicago. As I understand it now, you go some little distance out of the way?

A. Twenty-five miles around to go to Chicago.

Q. What has been done, if anything, since the Canadian Pacific desired to come up and make a connection in that way and get into Chicago; what has been done, if anything, to shorten that route?

A. The survey of the route has been made complete, and some portion of the right of way has been obtained, and I anticipate that the road will be built and completed before the Centennial Exhibition comes.

Q. Where will the loop line or connection be made?

A. It will leave the Butler road about 100 miles out of here.

Q. At a place called Montpelier?

A. Yes, sir, and run from there straight to Chicago, almost in a straight line; it makes the shortest line from here to Chicago.

Q. How will that route compare with the Michigan Cen-

tral route, in distance?

A. It is about 15 to 17 miles shorter.

Q. What sort of depot facilities will you have in Chicago as compared with the Michigan Central?

A. Just as good.

Q. What depot in Chicago does the Wabash come into?

A. The union depot, where there are six great companies come now.

Q. The Dearborn Street depot?

A. Yes, sir.

Q. And with this line built from Montpelier you will have 15 to 17 miles shorter than the Michigan Central?

A. Yes, sir.

Q. How will your depot facilities here in Detroit compare with the Michigan Central—I mean the new union depot here?

A. We will just be as well situated.

Q. A little better?

A. I think a little better.

Q. It will be a little better when the new post-office is constructed?

A. Just as well for freight and a little better for passengers; and

we will have a road running through a new country, with local

business to be brought here, all the way to Chicago.

O. You have been connected with the Wabash since they have run this line to Chicago. Will you state whether or not, with the passenger-house located at the foot of Twelfth street, the Wabash has been able to secure any considerable portion of the passenger traffic from here to Chicago?

A. They have secured some considerable, but nothing compared with what they would if they had other facilities, 247

and had their road built through.

Q. Is it not a fact that business men in Detroit who desire to go

to Chicago almost always go to the Michigan Central?

A. The large majority of them do. They can save a mile of traveling in an omnibus; they go there in preference to the Wabash.

Q. They go there because it is more convenient?

A. Yes, sir; because it is clos v.

Cross-examination by MI JICKINSON:

Q. You have spent parts of two sessions in telling the jury of various negotiations by which Detroit is benefited by railroads coming here, some of which have been successful and some of which have failed. You have shown the connections that have been made by the Wabash. You have shown the connections that have been given to the Canadian Pacific, and the western connections by that route. You have shown our relations with Chicago and the west. Now, will you please tell the jury what all that has to do with the choice of a route up River street from Twelfth street?

A. You mean as between two routes? Q. Yes; what has that to do with it?

- A. Not very much as to the mere choice between two routes.
- Q. Mr. Backus has never contended, and you have heard in my openings twice that he admitted the union depot was a great thing for Detroit?

A. I didn't have the pleasure of hearing your last opening. Q. But you know that Mr. Backus has never contended

that the union depot you are projecting was not a good thing for Detroit?

A. I never heard him say so.

Q. He has never objected that your connections here are not good things for Detroit and for him and for every one?

A. I have never heard it.

Q. You were present at another trial by Mr. Backus?
A. Yes.

248

Q. You never heard him make any point against the union depot?

A. I don't know that I have. Q. In testimony or otherwise? A. I don't know that I ever did.

O. And so far as the connections west or south or north are con-

cerned, it has nothing to do with, has it, in and of itself, the selection of a route up River street?

A. With regard to the different routes to reach it I don't think it has. With regard to the importance of the depot I think it has a

great deal to do with it.

Q. Has it anything to do, in the other aspect of the case, in case the jury shall reach it, as to what amount of damages Backus should have—if we reach that point, has it anything to do with that?

A. Not much.

Q. You don't pretend that, however great the public improvement may be, one dollar of damage can be done a private citizen who pays his taxes, or that his property can be depreciated at all, without compensation, under the constitution of the State?

A. No, sir.

Q. So that it really has nothing to do with the amount of damages Backus would suffer—all these great connections, or however great the necessity?

A. No, sir; all those things are said to show the importance of this depot. The necessity is one of the things to be passed upon by

the jury.

Q. But that has nothing to do with the question of compensating a man for what damages he has received?

A. No, sir.

Mr. BAKER: That is a question of argument.

Mr. Dickinson: Let me continue without interruption. I allowed you to go on in a wild way without interrupting you, and I wish to be allowed to examine this witness without interruption.

Mr. BAKER: I except to your statement that I went on in a wild

way.

Q. You are a pretty positive man in your statements, are you not?

A. Generally I am. I have pretty clear ideas, and I express them positively.

Q. You are certain?

A. Yes, when my mind is clearly made up.

Q. You have reviewed your testimony since you were here?

A. No, sir.

Q. Let me understand you now for one thing. If I understood you correctly yesterday, when you said that the reason, one reason, why the route could not run up the Michigan Central, was because it had destroyed your old union depot grounds?

A. One reason. We could not go through the middle of it.

Q. (Producing map.) The route as you have already laid it out is correctly shown there?

A. Yes, sir.

Q. It runs along the old union depot ground on the margin?

A. Yes, sir.

Q. Up to Twelfth street?

A. Yes, sir.

O. This is shown on this map?

A. Yes, sir.

Q. Will you please explain how you would have to run through the old depot grounds if you took the margin of the Michigan Central and ran up there?

A. We should not if we took the margin. We should not gain

anything in that.

Q. You would not lose anything, would you?

A. What I meant is this: Here are the old depot grounds; here we come here; if we were to go the shortest route we would go through the Michigan Central grounds and come there (pointing to map).

Q. But on this route at Twelfth street, as at present laid out, if you took the margin of the Michigan Central, you would not have

to change the route to Twelfth street at all, would you?

A. No, sir—but for a short straight route, we would have to run through the middle of both.

Q. But you have not a short straight route?

A. No, sir.

Q. And you have now run along the margin of your old depot grounds and run up to I'welfth street?

A. Yes, sir.

Q. Now, do you not, by the route you have taken, going into
251 River street, make an absolute deflection from the north of
your direct route, from what it would be if you ran along the
margin of the Michigan Central property?

A. Yes, sir.

Q. Then the route along the margin of the Michigan Central would be the most direct route?

A. No, sir; it would not be any more direct. We would have to

make a turn one end or the other.

Q. But you do that now?

A. But we have more turn to make now. We have to get up here (pointing to map). If we ran along on the Michigan Central grounds we would have to make a shorter turn here (pointing).

Q. We will leave that to the jury. Would you, if you had taken the margin of the Michigan Central ground, on your route as now laid out, and your route is on the north of the old depot grounds here at Twelfth street, would you have to change your route and your old grounds at all?

A. No, sir; we might not change.

Mr. Dickinson (showing map to jury): I wish the jury to see the route here that Mr. Joy said would ruin the property there.

WITNESS: If we went straight across the grounds, that was the

point I took.

Mr. Dickinson: This is the old depot grounds; this is the route of the union depot and the approach of the union depot now, on the north side along River street; they enter River street, and go through River street up here until they make the turn; the Michigan Central grounds are here.

Mr. BAKER: I object to Mr. Dickinson testifying.

Mr. Dickinson: Anybody can see that you can make a direct line along the margin of the Michigan Central, and nobody would pretend to ask for another route.

Mr. BAKER: I object to Mr. Dickinson testifying in this way. Is

that the route that you contend for along the margin?

No response.

Mr. Dickinson: You don't think that there will be any danger of any damage by cinders to Backus?

A. I don't think there will.
Q. No damage by smoke?
A. I don't think there will.

Q. No damage by obstruction to light?

A. I don't consider it so.

Q. No damage except by the posts in front?

A. They are some damage to him, but there is no serious damage, in my judgment, beyond that. I have said I had not considered

it much damage to Mr. Backus.

Q. There wouldn't be any more damage, then, would there, if the elevated road ran down Griswold street or Woodward avenue; none from smoke, none from obstruction of light, none from the ordinary uses of an elevated road like this; it would not hurt property to come down Woodward avenue?

A. I did not say it would not hurt property, but I think the property up there is not so valuable; it would be a larger damage

in proportion to the value of the property.

Q. But would there be any damage except from the posts, if it

came down Woodward avenue?

A. I don't think it would be a great damage there; I don't think it is a very large damage to property in New York, where the street railroads run.

Q. You think it makes a fair comparison with the street cars in New York using the elevated road, and this road with the cars that run over it, sometimes pulling passenger trains 1,000 feet long, as you said yesterday; you think it is a fair element to compare that structure here with the structures in New York?

A. I do think it is a fair comparison. It is the same kind of road, run in the same way, only the cars are not quite so heavy; but they carry ten thousand times more passengers than this will, and they are running every minute or two.

Q. Your union depot is built so as to accommodate, for passen-

gers, the Pennsylvania road, if it comes here?

A. Yes, sir, if it desires to come.

Q. The Pennsylvania is probably one of the greatest trunk lines in this country?

A. That portion would not be here.

Q. But it would be a part of the Pennsylvania system?

A. Yes, sir, if it is built here.

Q. And the Delaware & Lackawanna asked you to come here?

A. No, sir.

Q. Could either of those roads get into Detroit if you opposed it?

A. They would never come here.

Q. And the Pennsylvania road?

A. They may come here.

Q. With your present system of depot grounds and transit road, could they?

A. They could.

254

Q. Didn't you say on the other trial that they could not if you opposed them?

A. I don't think so; because the Pennsylvania is strong enough

to do anything, in my judgment.

Q. It could condemn its own right of way?

A. Yes, sir; but a new road coming into a city to condemn would not be strong enough, but the Pennsylvania is strong enough to do anything which it is willing to undertake to do, I think.

Q. Will you tell the jury whether you said that the Pennsylvania

could not get in here if you opposed them?

A. I don't think I said so.

Q. Let me see if I cannot find the testimony. (Mr. Dickinson looks over testimony taken at last trial.) I will look for it when there is an intermission; it is the testimony on the last trial I am asking about. I will come back to it afterwards. You have stated that in New York the elevated road does not frighten horses?

A. So far as my observation goes.

Q. In New York, in the business part of the town, horses are perfectly familiar with the elevated roads, are they not?

A. I presume so.

Q. They all pass more or less under them?

A. Yes, sir; I have seen them thousands of times, and never saw one frightened.

Q. That is because they have become familiar with them?
A. Very likely. They must pass under them frequently.

Q. Do you think that such horses would be in Detroit; that in the dealings with people down on the River road, all horses in Detroit would be so familiar with it that a man that went down there—a customer of Mr. Backus—his team would be so familiar with the elevated road as not to be frightened?

A. I don't think it would be in the slightest degree frightened in

the world.

Q. But as to whether horses are frightened or not depends upon whether they are accustomed to the elevated roads?

A. No, sir; but there might be such a thing as a very skittish horse.

Q. But it has something to do with the frightening of horses—whether they are accustomed to it?

A. As a general rule, horses that travel over such a street as that

are not frightened.

Q. The horses that travel under the elevated roads in New York are familiar with them?

A. I presume so.

Q. Who are your board of directors of the Fort Street Union Depot Company?

A. William W. Crapo is one, Mr. Shaughnessy is another, Mr.

Hayes of the Wabash is another, Doctor Potter of the Flint & Pere Marquette is another, and Mr. Heald is another.

Q. Where does Mr. Heald live?

A. In Grand Rapids.

Q. Is there any Detroit director?

A. No, sir.

Q. Are you a director?

A. No, sir.

Q. What official relation do you bear to the company?

A. Officially, I am the treasurer.

Q. But not on the board?

A. No, sir; I didn't care to be on the board, and declined to take

the position.

Q. You have given the history of some of the pieces of real estate below Backus, between there and the entry on Twelfth street, 256 below this road. Will you state to the jury what is the first case for condemnation you tried; in this matter of condemning River street, what was the first case you commenced?

A. Mr. Baker can tell you that better than I can.

Q. Was it not the Backus case?

A. Mr. Baker can tell you. I cannot tell the first case that was commenced.

Q. Do you know which was the first one you attended on this condemnation along River street?

A. I cannot remember that. Mr. Baker has the files and papers. Which was the first?

Mr. Dickinson: Will you admit it was the Backus case?

Mr. BAKER: No, sir; the first case we commenced was the Michigan Central; we tried the Michigan Central case.

Mr. Dickinson: But of the property-owners?

Mr. Baker: As to the property-owners, we commenced a large number of them and settled some of them. The first case we tried may have been the Backus case. We commenced them all about the same time.

Q. But you tried the Backus case before, didn't you?

A. It has been before a jury before.

- Q. And you remember that Mr. Backus on the first trial, for it was the first case of any case along the River Street road, took the position that you should go up the margin of the Michigan Central?
- A. I don't remember that. The position was taken that we should go across the Michigan Central grounds.

Q. Did you hear Mr. Mulliken's testimony?

A. I did. He testified that the shortest route was along the Michigan Central grounds, if I remember; that would be straight through the middle of our grounds, and straight through the middle of theirs.

257 Q. Oh, no; Mr. Mulliken said you should come right on that margin.

A. No, sir; Mr. Mulliken said the shortest route was across the Michigan Central grounds.

Q. Of course, the margin is across the Michigan Central grounds.

A. No, sir; and if you take that route it is not the shortest. Q. I never heard of any other route until you suggested it yes-

terday.

A. The whole testimony has been to go across the Michigan Central grounds; that is the way I remember it, and I think I am right, and I am very positive when I think I am right.

O. I don't think you stayed to hear any opening or argument of

mine in the Backus case.

A. I didn't have the pleasure of hearing your opening. Your closing argument I did hear all the way through.

Q. Do you remember that I pointed out to the jury that these

buildings were of no account, on the margin?

A. I don't remember that. I know the Michigan Central have testified in the other cases that they intended to build freight-houses along there.

Q. You have stated that an elevated road has been built by the

Louisville & Nashville road into Louisville?

- A. The Louisville & Nashville into Louisville-I won't say it is that, but I think it is that road—that an elevated road is built there, and I think built by that company, but I am not certain whether it is that company built it or not; but the elevated road I have seen.
- Q. There is no doubt that there is an elevated road there. Did you understand when you gave that testimony that there 258 is any objection to an elevated road especially?

A. There?

Q. Anywhere?

- A. I know the people are trying to get damages for building them.
 - Q. You know you are bound to pay damages for building them?

A. Yes, sir.

Q. As you pay damages for building a surface road?

A. Yes, sir, as the jury think we should pay.

Q. Do you understand that an elevated road is especially objected to as an elevated road?

A. I don't know that; I never inquired about that.
Q. Do you know that the Louisville & Nashville road did build an elevated road and occupied two blocks of street in building it?

A. That I don't know.

Q. Where did you see the elevated road?

A. Along the levee, in front of the buildings there.

Q. You don't say there is an elevated road right in the city of Louisville?

A. That is in the city of Louisville.

Q. But in the body of the city?

A. It does not run through the body of the city, but close to the front of the buildings along the levee.

Q. For two blocks does it not run along a street in the city of Louisville, in making the approach?

A. That I cannot tell you; I didn't go down there.

Q. You have testified in regard to it. Don't you know so far as it runs across two blocks in the margin of the street there. 259 as it approaches the elevated road, along the levee, they have the council's permission to do it; did you know that?

A. I didn't know it.

Q. Did you know that they paid for the property on both sides of the road what it was worth in the market, before they could do it?

A. I didn't know it.

Q. You also said about the building of the Jersey City road?

A. Yes, sir.

Q. By the Pennsylvania?

A. Yes, sir.

Q. The Pennsylvania have been into Jersey City at grade for many years?
A. Yes, sir.
Q. How many years?

A. They have been there and done their business ever since the Pennsylvania acquired its line to New York.

Q. When Jersey City was a comparative village?

A. It was quite a town then.

Q. And they acquired the same route; they acquired the route to the North river, didn't they?

A. They bought the road that owned that route; when they

bought that they owned the route to the North river.

Q. Have they done anything more in building the elevated road than to use their own right of way and to make it an elevated road instead of grade?

A. They occupy the same route.

Q. Where their tracks lay at grade before?

A. Yes, sir.

Q. Tracks along the streets—they have elevated their tracks? 260 A. Yes, sir, right on the same route.

Q. They owned the right of way?

A. I don't know whether they have condemned property or not.

Q. They acquired it about 50 years ago?

- A. I don't know that; they have been there a good many years; whether they paid any damages by reason of elevating the road I don't know.
- Q. Was there not along the entire route of the Pennsylvania road, in Jersey City, along the elevated road, as it was along the old route on grade, a public highway on each side uncovered by the elevated road?

A. I don't know about that.

Q. You have been over there from Washington, time and time again?

A. Hundreds of times.

Q. Don't you know that on each side of the old road as it came through there, there was a public highway, uncovered by any-

thing'

A. I think there was by the old road; it ran along the middle of the street, and I think there might be a highway on each side of it; but I think the elevated road spans the street, and I think it leaves the street under the elevated road.

Q. You won't swear to that-that there is not an open road on

each side of that elevated road?

A. I won't swear to it.

Q. When were you there last; have you been there since the elevated road was there?

A. It is not finished.

Q. Oh, yes; I was over it.

A. I have not been there since it was done, if it is done.

Q. But you do remember that when you were there, that on each side of the railroad tracks, switches and everything, there was a broad highway for teams and sidewalk for passengers?

A. I don't know anything about the switches, but I think the road ran along in the middle of the street, and I think there was a passageway for teams on each side of it.

Q. You acquired the old depot grounds under another organiza-

tion, didn't you?

A. No, sir; we bought them before the organization was made.

O. But they went into the hands of the Detroit Depot Company?

A. Yes, sir; another company.

Q. Then you condemned the approach all the way down for your transit road?

A. Yes, sir; part of it.

Q. And that transit road runs about four miles away, to Delray?

A. Something about that.

Q. Did your Detroit Union Depot Company form an organization under the laws of the State to acquire and build a passenger depot upon those grounds?

A. Upon the grounds they have acquired on Third street.

Q. But did the old union depot company form an organization to build a passenger depot?

A. They formed an organization to acquire station grounds, and

to build such buildings as may be required.

Q. Did you form an organization under the union depot passenger depot act?

A. Yes, sir.

Q. How much of a passenger depot did you put up on the

old grounds?

262

A. A very small one, because the three companies who failed to come there defaulted and would not come; and there was nothing but the Wabash there and we put up a small passenger-house, which we considered a temporary one, until other companies would come there, and their necessities made a large one necessary.

Q. If, without injury to your union depot grounds, maintaining your present route across there for your bridge to the Fort Street

union depot, and understanding it now that you could acquire the margin of the Michigan Central, and come up the margin of the Michigan Central, would it be a proper route?

A. If we could acquire the grounds of the Michigan Central, and enough for two or three tracks we want there, we could build on

their grounds undoubtedly.

Q. If you could acquire the same amount of ground that you have taken on River street along the margin of the Michigan Central, would it not be a good route?

A. I have no doubt it would.

Q. You spoke yesterday of having some hostility to the Michigan Central?

A. No, sir; they have been hostile to these enterprises.

Q. Mr. Baker asked you if they had not been hostile since you

went out of the presidency.

A. I think the hostility has grown up from the time we wanted to bring the Wabash into the city. Before that time I think the Michigan Central was entirely friendly to me.

Q. You remember, some three weeks ago, I made an argument before the legislative joint committee in Representative hall, Lan-

sing?

263 A. I was there.

Q. Insisting upon the Michigan Central paying local taxes?

A. I heard you there.

Q. Who replied to me in behalf of the Michigan Central?

Q. I appeared there for the city of Detroit and made an argument of taxing them, their large railroad holdings?

A. Yes, sir.

Q. And you replied for the Michigan Central?

A. I did.

Q. There is no particular hostility then?

A. I told you there was no hostility on my part toward the Michigan Central.

Q. Who was associated with you?

A. Mr. Pond was there, but I was not associated with him. Q. The present general counsel of the Michigan Central?

A. I was a mere volunteer there. I had to do with the organization of the Michigan Central. I made the contract between the Michigan Central and the State and knew the motive which governed them, and knew its whole history; it had been largely under I went out to the legislature without the remotest idea of saying anything upon that or any other subject, but I went into hear your argument, and I cannot sit still when a contract which I made, and which at the time it was made was of the utmost importance to the State, and which the State pledged its solemn honor it would carry out-I could not sit still when the legislature sought to evade that contract, and I had to get up and give the whole his-

tory of it to the legislature. I did it, not because I care for 264 Mr. Vanderbilt-I don't care a farthing for him-but I have no hostility to him nor to the Michigan Central road, but

when injustice is sought to be done by the legislature or any other party, I thought it was my duty to defend it.

Q. You heard my speech there?

A. Yes, sir.

Q. Didn't I say the property acquired outside of the charter, and was not covered by the charter, could be taxed?

A. That is so.

Q. Do you think it is injustice, where the State has no contract? A. I think it is an unjust thing to pass an act repealing an act that should not be repealed.

Q. Did you hear the argument?

A. Yes, sir.

O. Didn't I insist that the charter didn't cover the after-acquired real estate?

A. That is another point.

Q. Did I not insist that the charter was binding on the State? A. You insisted that the company might accept the charter.

Q. They might accept it if they chose?

A. But you argued for passing it, and that would lead to litigation, and they would have to go through the courts to get a decision that the act would be void; in the meantime the credit of the Michigan Central would be injured in all the markets of the world, and it would be the most injurious thing in the world, and I could not sit by and see it done.

Q. What did you go out there for?
A. To look on; I knew the question was coming up be-265 fore that committee, and I wanted to see what they would say all round.

Q. At all events, you were not particularly hostile to the Michi-

gan Central or to the general counsel on that occasion?

A. I was not hostile to him at all; I am not; but I tell you they have no right to get in my way, and when I have to defend our enterprises against them, I have to meet them as I can, but as to having hostility to them, I will defend them before the legislature or anywhere else as quick as I would any other friend of mine. look upon the Michigan Central as a sort of pet of mine; I was at its birth and have been familiar with it ever since, and I could not help defending it.

Q. I will ask you whether your administration of the Michigan Central's affairs, including the building of the new feeding roads, has not been entirely vindicated by events, although you were very

strongly censured at the time?

A. I cannot tell you about that, but I know everything was sanc-

tioned by the board of directors when it was done.

Q. But you know there was cavil and censure about it at the time?

A. Yes, sir.

Q. And events have fully vindicated your judgment?

A. That may be so and it may not. I remember one of the directors at one time in conversation with me, after the panic, at which time there was some fault found with the building of those

roads—he was not a man of that sort, though, but I saw him down here one evening, and he said, "The Michigan Central's affairs look pretty bad, Mr. Joy." I said, "That is all true." Mr. Van-

derbilt was buying the stock at that very time at from 30 to

40 cents on the dollar; and he says, "It is all owing to that damned Joy." Whether I have been vindicated or not, that is another thing.

Q. I know you have. I will testify to that myself.

A. I did the business, and under the circumstances I had to take the consequences.

Q. When you came to condemn, although the Backus was the first trial except the Michigan Central, when you came to condemn the rights of the Michigan Central on River street, you must come up from the union depot to your passenger depot; when you elected to condemn the rights of the Michigan Central and came along River street, the Michigan Central did not urge the question of necessity very much, did they?

A. They argued the case in every possible form. They brought up the question of necessity; it was before commissioners, and Mr. Pond and Mr. Russell raised the question of necessity, and assumed that they were going to win on that question. Mr. Hecker, who was the chairman of commissioners, and the other commissioners said. "Mr. Pond, we don't want to hear you on that question; as to the necessity of this thing we are satisfied."

Q. That is the union depot?

A. Yes, sir, "and it is going along this street;" they took the ground that they had a right to bring up the question of route; it was on the question of route and necessity too, the necessity of that Mr. Hecker said to him, "I don't want to hear you on that question; we are satisfied of the necessity of this thing; we are satisfied that it is going there, and that it ought to go there, and we won't hear that question; we are satisfied of the necessity of the thing, and we are satisfied of the necessity of the route."

267 Q. They were satisfied of the necessity of the route much

better than by going along their grounds? A. There was no possibility of going there.

Q. Did you ever ask the Michigan Central to give you entrance and not take any public street?

A. No, sir; we knew perfectly what the answer would be to that.

Q. You knew they would fight you? A. I knew they would, of course.

Q. And charge you all they could get out of you to come up there?

A. Yes, sir, it is their nature.

Q. Did the commissioners allow the Michigan Central anything for the property they took for a public causeway for teams, of their property?

A. Down at the corner, you mean?

Q. No; I mean for taking the causeway for teams on the Michigan Central grounds.

A. I don't understand what you mean by that.

Q. You know there is to be a viaduct for teams along the south side of the elevated road structure, according to the plans. Did the commissioners before whom the matter was tried, allow the Michigan Central anything for the viaduct for teams, for the ground taken for the viaduct for teams?

A. They didn't; I don't suppose we could have taken it at all.

Q. They expressly said they didn't find anything for it?

A. I know it; we didn't ask for it.

Q. But the commissioner of railroads ordered it taken?

A. But not in that proceeding, and the commissioner I take it could not grant power to do it.

Mr. BAKER: The Michigan Central was ordered to do it as 268 much as the depot company.

Q. The Fort Street union depot will accommodate all the passenger trains of these four roads, won't it?

A. I think it will.

Q. And will also accommodate on the same grounds the freight trains of two roads, the Detroit, Lansing & Northern and the Flint & Pere Marquette.

A. Not on the same ground, with the passengers.

Q. On the grounds you have acquired for your Fort Street union depot; it is on a part of the same ground? A. Yes, sir.

Q. It would do that, and you think they will be fully accommodated there?

A. It will be a close fit, I think.

Q. How can you take in the Pennsylvania road then? A. When I speak of a close fit, I mean for length.

Q. But you can accommodate them? A. Oh, we can take them in there.

Q. And you can accommodate the Pennsylvania? A. I think we could, and another company besides.

Q. And have an abundance of room?

A. I think we could so far as passengers are concerned.

Q. And how many acres are there in that piece that you have acquired for a depot?

A. I think there are about five acres.

Q. Including the freight part?

A. I think five acres. I must explain that position: When I say that we could accommodate other passengers coming there, when you have a passenger ground for any railroad company, you have to

have 1,000 feet long at least, you have to have tracks for that company, even one company; now a passenger train comes 269in and runs out, it does not stay on the passenger grounds half an hour at any time, and while it is going out another may be com-

ing in, and the same track which you are compelled to acquire for one, or two or three companies, on the same ground, which you must have to do their business, you can do the business of twenty, simply because one will come in for half an hour or 15 minutes, and go out, and they may come in and go out every 15 minutes in the day, and on those sort of grounds we can accommodate a good

many

Q. There is no doubt about that at all. You spoke yesterday of the elevated-station grounds in London. I suppose you have been at the Charing Cross station, the Victoria station and the Ludgate Hill station?

A. Yes, sir.

Q. They are passenger depots mainly, with hotels?

A. Yes, sir.

Q. How many acres are occupied by those depots in the city of

London—Charing Cross, for instance?

A. I don't know. I never measured them, but where they come in at Ludgate Hill they have considerable grounds, but their freight business is generally outside.

Q. But there is not over five acres at Charing Cross?

A. I don't know that.

Q. At Ludgate Hill how much, according to your estimate?

A. I should think there was more than that, but I never measured it.

Q. Have you been to Victoria station?

A. Yes, sir. Q. How much was occupied?

A. They have all the grounds they want for their business, but I don't know how much.

270 Q. When the Michigan Central acquired its grounds below here, how much of a city was there down there at Third street?

A. There was nothing there.

Q. They went from about here? A. Right from this spot.

Q. And the city had not gone down that far then?

A. The city had not gone down on the river that far; a little before that General Cass had sold his front to a parcel of gentlemen who wanted to make a speculation; they filled in the river front on the Cass farm; I said yesterday that where the Michigan Central grounds were was all river; it was not all river quite when they went there, but that part of the ground that was on the Cass farm had been partially filled by these gentlemen, but it was all in the river where they filled.

Q. Where was the old depot in the city of New York, which is

now at Forty-second street?

A. It was a migratory depot. When I first knew it, it was on Chambers street.

Q. Then it retired to Thirty-fourth street, didn't it?

A. It retired northward; to what street I don't now remember. Q. Then it retired to one other place before it went to Fortysecond?

A. I think it did.

Q. And it retired before the approach of the business and population, didn't it?

A. Well, no, I don't think that was the object of its retirement.

Q. But it did retire as population went up?

A. It did retire, but it retired because it united finally with the New York & Harlem road, which was an old road which was built into New York before New York was built up.

Q. Why did it have to go there to unite; why not have an ele-

vated road down in New York?

A. They went up there because they could get grounds at the ime.

Q. Have they not more grounds at Chambers street than they

have here?

A. I could not tell you that, but they went up there because they could get four companies to unite to form a union depot; the New York & New Haven and the Boston & Albany came in there; all the roads to Boston came in there; the New York & Harlem and the Hudson river came there, and they got together strength enough to come in those grounds.

Q. They all come in that side of the island?

A. Yes, sir.

Q. You don't know of a railroad that crosses the city of New York from the North river?

A. There is no occasion for one. They cannot get there?

Q. They do cross the island, don't they?

A. Street railways do. They run across the Harlem river in New York and run across the north side of it.

Q. But they get down on the east side of New York?

A. The New York Central runs down on both sides; runs its passenger trains across above the Harlem river and comes down in this passenger-house; it runs its freight trains down the other side of the city, clear down to St. John's park.

Q. But it does not come across the city anywhere?

A. No, sir; it crosses above the city.

Q. How many acres does the union depot of New York occupy?

A. I cannot tell you; but it occupies a good many acres.

Q. About how much?

A. I could not tell you.

Q. Six and a quarter acres?

A. I should say it was more than that. They have bought an addition all along one side of it, to build a new passenger-house.

Q. But that is included in the six and a quarter acres?

A. I don't know how much.

Q. Would you say it is over six acres?

A. I should say it was, but it is a guess. I should say it was considerably more than six acres of land there, by a rough guess, but I don't know, I never measured it.

Q. You have spoken of the Chicago, Burlington & Quincy; that

comes into Chicago with several other roads, does it not?

A. Yes, sir.

Q. What is the name of the depot that it enters?

A. I don't believe I can give you the name of the depot. It is on the west side of the river. It is occupied by the Alton Com-

pany, the Chicago, Burlington & Quincy, and the Chicago, Milwaukee & St. Paul.

Q. Is it the Canal Street depot? A. It may be. It is a union depot.

Q. How many acres are occupied by that union depot?

A. I should think about what we occupy here.

Q. About five acres?

A. About that.

Q. And all those roads come in there?

A. Yes, sir.

273 Q. How far is the freight business done from the Central depot in New York, the union depot, the Forty-second Street depot?

A. It is clear down on the other side of it—on the river.

Q. How far is the freight business done from the Canal Street depot for the Chicago, Burlington & Quincy?

A. I should think it was a mile.

Q. The Canal Street depot is down in the flat, below the level of the city?

A. Yes, sir. Q. Where does the Wabash go in in the city—where six other roads and the Wabash come? Is it into the Dearborn Street depot?

A. Yes, sir.

Q. How many acres are occupied by that?

A. A good many acres.

Q. Dearborn street, for the passenger-house—the passenger union depot?

A. For the passenger-house it may not be any more than here.

Q. Where do they do their freight business?

A. Further south, just about as far south of the passenger-house as the old depot here would be from this passenger-house here.

Q. Do you know how many trains come into the New York Central depot?

A. I don't.

Q. Is it 238 or 240; would that be out of the way, per day?

A. I could not tell you.

Q. How many come into the Dearborn Street depot?

A. I don't know.

274 Q. Would 140 be out of the way?

A. I should not think it would, but I don't know.

Q. And the Canal Street depot-how many trains, 195?

A. I could not say.

Q. Are you familiar with the depot at St. Louis?

A. Perfectly.

Q. You know that all the roads use that union depot?

Q. How many acres are occupied by that-for that union depot?

A. I have no knowledge of it.

Q. About 12?

A. I could not tell you.

Q. 240 trains a day?

A. I could not say. They have grounds to accommodate the trains well—to do the business.

Q. Would you say about 12 acres?

A. I could not tell. I have been there to take the train a good many times, but I could not tell you.

Q. They don't pretend to do their freight business in that place?

A. No, sir.

Q. How about the Minneapolis depot?

A. I never was there.

Q. Omaha?

A. I have been there.

Q. Can you give us an idea of the amount of acreage at Omaha, new city as that is?

A. I could not say.

Q. Would you say it was to exceed six acres?
A. I could not tell you; I never measured it.
Q. Are you familiar with Kansas City?

275 A. Yes, sir; I bought the union depot grounds there.

Q. About how many acres are used for the union depot grounds there?

A. I don't now remember. It is 30 years ago since I bought them. I bought a pretty good tract of land there, but I don't remember how much; and quite a number of trains come upon it.

Q. About the acreage of the Michigan Central here; it is about 30 acres down here on this space between Third street and Twelfth

street.

A. That includes freight and passengers; say 38 to 40 down here, 100 out yonder, and 150 feet wide out here, that they use for a yard.

Q. They used this yard for freight business, down here on the

river?

A. For such freight as they have to do there.

Q. They do use it for freight business and passenger business as well?

A. Yes, sir.

Q. How much has the Grand Trunk?

A. I have never measured it.

Q. 23 acres?

A. I don't know; I cannot give you an estimate. I never looked at it with a view of estimating it.

Q. And the old depot ground down here, according to the present holding, is about 40 acres?

A. About 40 acres?

Q. About how many trains come in on the Michigan Central here?

A. I don't know.

Q. Is 68 out of the way?

A. I could not tell you anything about that; I have not counted them.

Q. How much did they use to be?
 A. I don't know; I cannot remember.

Q. How many trains come in and out on the Wabash; how many did you say yesterday?

A. I cannot tell you that without looking at my paper; I made

a memorandum of those.

The witness refers to his memorandum and says:

A. There are 10 trains on the Wabash.

Q. You don't know how many on the Grank Trunk?

A. No, sir.

Q. Do you know the amount of acreage of the union depot at Indianapolis?

A. I don't. I have been through it over and over again, but I

cannot tell you how many acres they have got.

Q. In your estimate that you have put before the jury of the number of engines, of the number of trains that would pass with locomotives, you have not given the time that it would take a train to pass, of a thousand feet long, as you have stated, for the cars?

A. It would take each car in that train so many more minutes,

Q. You have a switch in front of Mr. Backus' property?

A. Yes, sir.

Q. Have you taken into consideration the length of time that the engines would be upon the switches?

A. That would not make a difference. The switches are merely for trains to run through; there will be no switching there.

Q. With switches there, would you be entitled to switch?

A. We are entitled to switch-

277 Q. You are entitled to have your trains stand on the elevated road?

A. No, sir; they would not stand there.

Q. Where do you get the prohibition against a train standing on

your own right of way, or a switch-engine or a locomotive?

A. There is a difference between a right of way and a yard. In our own yard we can stand our own engines and cars as we have a mind to; but on the ground obtained for the right of way of a railroad, we cannot allow them to stand if the adjacent owner objects.

Q. Where do you get your rule for that?

A. In the decisions of the courts.

 Q. Name one.
 A. The Pennsylvania Central road, in a case at Camden, N. J.; I cannot tell you the volume. I have got the brief in my office, which I can furnish to you; and two cases in New Jersey where they laid their station across a highway.

Q. At grade?

A. Yes, sir. Another case in Vermont, where they brought up the point, that what is obtained for a right of way cannot be used for a yard if adjoining proprietors object.

Q. Those were cases at grade, where they obstructed the streets,

were they not, all of them?

A. Certainly.

Q. Do you know of any rule that prevents your standing on your right of way, in the country, in transacting business?

A. These were decisions in the country.

Q. I mean in the country, away from any road?

A. Oh, where there was no road, and nobody objects to it, you can take a license, of course.

Q. You have a right to stand on this switch, have you not, when trains pass?

A. They would not stand there.

Q. But you have a right to wait for anothor train and then back up and go ahead on the switch?

A. I don't think they would.

Q. Have you not the right—is there anything in the law anywhere to prevent your standing on the elevated road?

A. On the right of way?

Q. Yes.

A. Yes, we could not do it.

Q. Name the law.

A. I have given you three cases. It does not make any difference whether it is on an elevated road—the right we get under the law.

Q. Did you take into consideration, in your estimate, the probability or the possibility of the Pennsylvania road or any other roads coming here?

A. Estimate of what?

Q. Of the number of locomotives that would pass?

A. No, sir; I speak of those that now pass. Then on my supposition that if there were twice as many, and then if there were four times as many, how much it would be; and that would include all that would ever run there, and more, too.

Q. You acknowledge that the true rule in estimating is what the

maximum would be?

A. What the maximum would be in 100 years would not be right now.

Q. But a reasonable time ahead, to take the maximum?

A. There is no doubt about that.

Q. Are you acquainted with the laws of light?

A. I am 80 years old, and I have traveled in light and darkness a good many times.

Q. Have you studied the law of light at all?

A. When I was a boy I studied what they called philosophy—light and other things.

Q. Have you looked at it since you were a boy?

A. I have read occasionally since that time.

Q. Let me ask you this question: Whether it is not an axiom of the law of light that the light is graduated by the degree of obstruction to your view of the horizon of the sky—of the atmosphere?

A. That is a little broader question than perhaps I can answer.

Q. Have you ever studied it? Is it not an axiom of the law of light that your light is graduated by your own view, by your sight

of the atmosphere?

A. I cannot get so much light out that way than I can this way (illustrating).

Q. Now here is a pretty broad space here; suppose there is a 21-55

building 40 feet away from here, so that you cannot see the horizon at all; does it obstruct the light?

A. If it was so high that it stood between my eyes and the atmos-

phere, it would obstruct the light somewhat.

Q. Is it not true that as your vision of the atmosphere is obstructed, a shadow is cast?

A. The shadow is cast if the sun is the other side of it. Q. Suppose a day like this, when there is no sun.

A. There would not be much shadow.

Q. Let me illustrate. (Counsel takes two law books.) Suppose that is a window, and suppose a building is here?

A. If it stood there it would obstruct it.

Q. If you stood so that you could not see out of the window?

280 A. It would obstruct it.

Q. How would the light be, if obstructed at all-how would the degree of darkness be, as between a point near the window and back in the room; would the darkness be greater or less as you re-

treated from the window?

A. I don't think it would make much difference; if you put that 40 feet off away from the window, and the window was 40 feet away, and the space as wide as five feet placed in front of the window 40 feet away, I don't think it would affect it very much, but it would some; if you wanted to look straight through that into the street, you could not see it.

Q. Have you been in the streets of New York where there is obstruction, where the elevated road is in New York, say on Water

street?

A. I don't remember Water street particularly.

Q. Don't you know that will not differ, except at the hour of high noon, when the sun shines down in the street; that they burn gas in their front windows, and in the front part of the stores along there?

A. They burn gas in their office generally, where there is a narrow street, with high buildings on both sides; in the lower story they have to use gas in their offices.

Q. Do they do that because of the elevated road?

A. No, sir, they do it on any street.

Q. And the elevated road has not affected it some?

A. I would not say it has not affected it some, but they do it on any street there.

Q. They have to burn their gas in the back part of the store any-

way?

A. Yes, sir; that is generally where their offices are. A store in the city, on a wide street, which has no window in the rear, the street 125 feet wide in front of it, they will have an office in the back of it, and they keep gas burning there.

Q. This elevated structure is to have a causeway on one side fo

teams, besides the elevated structure?

A. That remains to be seen.

Q. It is on the plan?

A. Not on this plan here.

Q. But it is contemplated so?

A. That would depend upon the Michigan Central.

Q. But it is contemplated?

A. It may be done.

Q. And on the other side you have got to have a footway, on the north side?

A. Yes, sir.

Q. How wide is that to be?

A. I don't remember.

Q. A foot passenger is not going to jump from tie to tie; that is going to be a solid walk for foot passengers?

A. I don't know about that. You have had the engineer of the

plan here; I am not the planner of it.

Q. Then you put on top of that structure a train. Don't you

think that it will obstruct the light to some extent?

A. A train would be perhaps a minute passing there; it would be 40 feet away, and I don't think it would obstruct the light very much passing there; it would not obstruct it anything like as much as a high building on the other side of the street, which the Michigan Central has a perfect right to build there.

Q. Do you know the original purpose of putting streets in cities,

besides the matter of locomotion and passage?

A. Public convenience.

Q. Do you know what consideration enters into the width 282 of the streets?

A. In some cities they provide that no buildings on streets of a certain width shall be over a certain number of feet. The object of that is as to danger of fire; the building may be so high that a stream of water would not reach it from the fire-engines.

Q. Has light for houses anything to do with the putting of streets

in cities?

A. The wider a street is the lighter it will be. Everybody here lays out streets to sell his lots.

Q. You are familiar with Paris? A. Yes, sir.

Q. Do you know anything about the building of the boulevards by Baron Haussman?

A. I have been through them.

Q. You are interested in French literature, I understand?

A. Yes, sir.

Q. Have you read Baron Haussman's argument in favor of boulevards?

A. I don't think I have.

Q. To widen the street and clear it of obstruction?

A. I don't think I have. He laid the Boulevard Haussman by cutting right straight through.

Q. But he made a large number of other boulevards by widening the streets and cutting down the blocks?

A. I could not tell you about that.

Q. Was not one of the objects of that to give light?

A. Not so much to give light. Baron Haussman and the Em-

peror Napoleon knew perfectly well that Paris is largely supported by the large number of people who go there to enjoy that city, and they wanted to make it as pleasant a place as they could make it.

Q. But I want to know whether you have read the reasons, and

whether one reason was not to give light in the houses?

A. I have not read the argument of Baron Haussman.

Q. And you think you can put a structure like this, and over which you propose to run four great lines of railroad, under which you put solid pans to catch the cinders, and spanning the entire roadway of the street—you think you can put up such a structure as that without obstructing the the light of the adjoining buildings?

A. I didn't say that. I said to some extent it would obstruct it;

but it is forty feet away.

Q. Part of his building is within ten or nine feet-of Backus?

A. But there are no windows in it.

Q. The dust-room?

A. Yes, sir.

Q. But has he not a perfect right to enlarge his mill and build it up to the line?

A. Undoubtedly.

Q. Build it all up to the line?

A. Undoubtedly. So has the party on the other side the right to

build high buildings on the other side.

Q. Are you familiar with the deal between the Detroit, Lansing & Northern and the Michigan Central by which the freight sheds were acquired on River street? Were you familiar with the deal by which the Michigan Central bought the front of the property there when the Michigan Central bought them of the Detroit, Lansing & Northern?

A. As far as those sheds were concerned, I had nothing to do with

the deal.

Q. Do you know anything about how much a foot they

paid for it, for 200 feet?

A. They didn't buy the lands where these sheds were; they bought 160 feet—150 feet of the Lansing road, running through from River street to the river; there was 160 feet; I owned it once; I sold it to the Michigan Central.

Q. Just tell the situation; between what streets it is.

A. It is just below the Michigan Central, and part of the course of the Michigan Central as it now is is on it; it is just below the Michigan Central tracks, except that they ran over one corner, I think; that is 50 feet wide, I think; the tract of land they bought I forget how wide it was; it is on River street, fronts on River street, but I sold it to the Michigan Central for \$50,000; that was pretty soon after the war; there is 10 feet more which is reserved for a sewer under it, so that there is, in the whole, 60 feet, with a solid sewer under it, and whoever buys it has the right to use the land above it, subject to the right of the city to repair that sewer when it gets out of order, as it does occasionally. That property has been

sold by the I ansing road to the Michigan Central road, and that is all that has been sold. Their freight sheds are not on it.

Q. For how much?

A. I think \$80,000; running through about 300 feet to the river, with a river front and a front on River street.

Q. Does that run through to the Michigan Central?

A. It was put into the Michigan Central grounds by the Lansing Company; it goes right straight across what is now the Michigan Central grounds, from River street to the river.

Q. How much front on River street?

A. I forget the frontage. I should have to look at a deed to tell you the frontage. I can tell you tomorrow; I forget now.

Q. When you bought on the corner of Twelfth street you wanted about 12 feet to add onto Twelfth street for the use of the railroad?

A. Twelve or 15 feet; not for the use of the railroad but to give a wide, spacious street as an approach.

Q. And for the 72 feet you paid \$27,000.

A. About \$27,000.

Q. And how far back does it run?

A. Seventy-two feet back from Twelfth street; it runs from River road to Fort street, includes the front on Fort street, the front on River road and the front on Twelfth street; it is something more than 300 feet from one street to the other, there.

Q. You think you paid too much, do you?

A. I know I did. I have done that a good many times in my life, when I must have a piece of property and cannot get it without

paying what the party asks for it.

Q. You know that in the rear of the Backus property, except for the small front that he has for an office, on built-up ground there, you know that his property runs against the stone wall of the Michigan Central?

A. I think it runs against the Michigan Central part way.

Q. Their stone wall?

A. Part way.

Q. The stove works, that have been spoken of here, have just as much front on Fort street as they have on River street?

A. I think now it is about the same.

Q. They have an access to Fort street on a level with the street?

286 A. Yes, sir.

Q. On all the great stove-works property?

A. Yes, sir.

Q. And they can use that for shipment, if they please?

A. Yes, sir.

Q. Their storehouse is along Fort street?

A. Yes, sir.

Q. Do you know the situation of the Backus plant, including his lumber yard?

A. I know of the situation of his mill, and I know the situation of his lumber yard.

Q. And of his storehouse on Fort street?

A. Yes, sir.
Q. He has a large property there on Fort street as a storehouse?

A. Yes, sir.

Q. With his mill, manufacturing various kinds of material, situated at this point, in front of which you wish to condemn?

A. Yes, sir.

Q. Then another part of the same plant is the seven acres down on the river-the docks?

A. Yes, sir.

Q. You know that he ships or takes his raw material from his docks and from the storehouse—the rough lumber—to his mill?

A. Yes, sir.

Q. Do you know the amount of business he does in a year?
A. I don't.

- Q. Have you ever been through his storehouse to see his manufactured articles?
- 287 A. No, sir. I have looked at it as I went by; that is all. Q. That is quite a large piece of property on the north side of Fort street?

A. Yes, sir.

Q. And his other piece of property on the river there is about seven acres?

A. It may be so.

Q. And his mill, which is between the two on River street, on which you condemn, is how many acres?

A. I don't know.

Q. You know this is all one plant and one business?

A. I know he is working them together.

Mr. Dickinson states that he wants to ask the witness something about what he testified on the other trial, but he will do it after the direct examination. Mr. Baker thereupon asked the following question:

By Mr. BAKER:

Q. In locating this line along River street, did you have occasion to consider the legal question, whether you could condemn a right of way through or along the margin of the property of the Michigan Central?

A. We did.

Mr. Dickinson then says that he has found the testimony of the witness on the other trial, and will resume his cross-examination.

By Mr. Dickinson:

Q. Please state whether you testified this on the other trial. I am not going to impeach you, but to refresh your memory. I am going to show that you didn't think the Pennsylvania road could get in if you opposed; that is what you said. Your testimony reads as follows: "Q. With the Michigan Central occupying the

place it does, with your union depot extending forty acres below, or the distance it is, and with your line of depot run-288 ning four miles out from the end of your depot ground, what way do you think the Pennsylvania road would take to get in here and get depot facilities, if you opposed it? A. I cannot tell you:

I don't think they could get in here if we opposed it."

A. I didn't think I said that, but I will not deny it if you have got that down there. The motive of it is this: No railroad company will build into a city where it will cost more to build than the business which it will get in that city will pay the interest on. Now, the Pennsylvania road would get some business in this city if it were built; if it were built here it would be of some importance to this city, but the Pennsylvania Central railroad coming here alone and trying to get into the business part of this city, as close in as we are, it would cost the Pennsylvania Central a vast deal more than it would pay to come into the city of Detroit; therefore they could not get here. That is what I mean by that. Whether we opposed them or not would have nothing to do with it; if we opposed their coming into these depots here, perhaps they could not get in here. But I never said we should oppose them there, but if we opposed them, would not allow them to come there, then they could not afford to come here, and they could not get here, because it would cost them too much money. That is all I mean by that, and I say the same today; but I told the Pennsylvania road if they would come here they would have free access to this depot, and I went to Philadelphia on purpose to tell them so.

Q. You have made some statements to which I wish to call your attention. What time did you organize your original union depot

company?

289 A. I cannot tell you exactly, but some time about 1880 or 1881.

Q. 1881?

A. Yes, sir.

Q. Was the legislature in session?

A. I cannot remember. The legislature was in session when they passed the bill.

Q. Did you draw this act that I will read to you (referring to act in Howell's Statutes)?

A. No, sir; I didn't draw it.

Q. You thought you did on the former trial?
A. I didn't.

Q. You said you thought you did on the former trial?

A. I don't think I said so.

Q. Do you know the act I propose to read?

A. I suppose it is the union depot act.

Q. Oh, no; this is the one you said you thought you did draw in 1881: "When any part of the land of any railroad company of this State in or adjacent to its depot grounds is not in actual use for depot o other purposes pertaining to the operation of a railroad, and such land is not needed by such railroad company, for the purpose of depot or other terminal facilities, it shall be lawful for any

other company organized as aforesaid, needing such land for the purpose of a depot in terminal facilities, to acquire the same in the same manner as may now be done for such purposes by individuals, the question of actual use and of necessity, for the aforesaid purposes by the company so owning and not using said land, shall be determined, in addition to the other questions, as provided by law in cases of condemnation of land for the purposes aforesaid, and

the same proceedings in all respects as near as may be shall be had for the purposes aforesaid, as now provided by law where land is acquired for such purposes by individuals."

A. I think it possible that I did draw that act. I have drawn so

many of them that I don't remember them all.

Q. That is in 1881. The question of whether a part of the Michigan Central grounds which would be needed for your company, the question being upon whether it is actually used or needed by the Michigan Central Company, and you say it is all actually used and needed for the Michigan Central Company?

A. Yes, sir.

Q. Before whom did you provide that the question whether they did actually use or need it should be tried, in that act. Read the act and see before whom you proposed to have the trial?

A. I don't care about reading it. If it is actually used no tri-

bunal could try it.

Q. What did you mean by this, then: "The question of actual use for the aforesaid purposes by said railroad company so owning and not using said land shall be determined, in addition to the other questions, as provided by law in the condemnation of lands for the purposes aforesaid, and the same proceedings in all respects as near as may be, shall be had for the aforesaid purposes as now provided by law where land is acquired for such purposes by individuals"?

A. I suppose when I drew that law I could not imagine, to save my soul, that anybody would ever ssk that a question should be tried whether the Michigan Central would be using its depot grounds.

Q. Why did you put into this act that the question of actual use

or not should go before a jury?

A. It is perfectly absurd to ask that about the Michigan Central.

Q. But who is to decide that question?

A. You or I could decide that.

Q. Did you provide for a tribunal? You swear to law here.

A. I do swear to law.

Q. What tribunal did you provide in that act should pass upon that question?

A. You or I could decide that. I suppose I drew that bill, but I don't now remember, but supposing I did, it was drawn with reference to existing circumstances—

Q. I want you to answer the question; what tribunal was to pass upon the actual use or need of the Michigan Central property?

A. It is not a question of need. They have got to pass upon the question of use.

Q. Who pass upon it?

A. A jury of course might if there was any question, but that was drawn with this view; I had once a controversy of that sort; sometimes a company owns a great deal of land that they don't use nor won't use, but they don't want another company to have it.

Mr. Baker: That law supposes a case where there is a dispute

about it.

292

A. Yes, sir, and where there is a large tract of land which one company owns and which it does not want to use itself, but which it does not want another company to have. Suppose the Michigan Central owned all this land we have down there for the old depot ground, and were not using it at all, and we were going there for a depot ground, and that was not in use, I could then get a jury and

impanel them to condemn that property and ascertain whether it was necessary for the Michigan Central Company to use it

for the future?

Q. If it was not in use?

A. Yes, sir; but if it was in use like the Michigan Central grounds, no man would be fool enough to ask any questions of that sort?

By Mr. Dickinson: But do you not provide that a jury shall pass upon the question of whether it is needed by the Michigan Central?

A. The law tells that.

Q. And the question of need goes to a jury, just as you condemn the other proceedings against individuals?

A. It is not a question of need, but of the actual use of it.

Q. And that question goes before a jury; you never took any preceedings against the Michigan Central?

A. No, sir.

Q. You say they have 36 acres of land down there?

A. Yes, sir.

Q. Right here in this city?

A. Yes, sir, but they have not got as much as they need.

Q. But they have got some ten times more than your union depot with four roads?

A. Not for a passenger-house. Passengers do not require but a small space. We have got for the same purpose down there forty acres, down below.

Q. And you have shown, for every other city that you have testified about, that they do their freight business outside of their union depot?

A. Not entirely outside of their passenger union depot, but they have freight union depots in the city, and they have freight yards outside, because they cannot afford to own enough in the city.

Q. Of course they cannot. I will shake hands with you on that. Now suppose that you built an elevated road. You have shown, I think, by your engineer, that a switch running up River street on the north side, that to these factories, the Union mills and the stove works, could be operated with a train of cars

and a locomotive of the largest kind, with perfect freedom under your elevated road—is that not so?

A. I have not said anything about that.

Q. Mr. Ellis said that, and you think it can be?

A. I think it can be if the public will allow it to be done.

Q. You think it can be operated under an elevated road perfectly well?

A. Yes, sir.

Q. What do you think a jury would say as to the Michigan Central, if you offered to build an elevated road along that margin, where you could operate a line under the railroad track, if the Michigan Central told a jury they needed that?

A. The question in the first place would be whether the Michigan Central is actually using its land; if it is actually in use, you cannot take it under that law. An-body could decide that, as you

see it is in actual use.

Q. But if such a question came up, do you not provide there that that question shall be decided like every other one, by a jury? You know what it would be; you know what the jury would say?

A. Yes, sir, we know that the Michigan Central is occupying every inch of that ground; and when that would come before the jury, the jury could not help saying that they did.

Mr. Baker: I desire to put the question right to you here, Mr. Dickinson, whether upon your honor as a lawyer, as counsel in this case, you claim that we could condemn a right of way across the Michigan Central?

Mr. Dickinson: I have not the slightest doubt of it; I think it should be done, and you can get every disinterested man in this

town to tell you so.

Mr. BAKER: You cannot; and I put the question to you now, whether you are going to insist upon any such thing, so that I can bring it to the attention of the court?

Mr. Dickinson: I have insisted upon it from the beginning. I have insisted upon it since January, 1891. Your statement is mere

buncombe.

Mr. Baker: There is no buncombe about it. We claim that under that act we could not condemn a right of way across the Michigan Central property. There is no reputable lawyer in the State would say so.

Mr. Dickinson: You will find all the reputable lawyers will

say so.

Mr. Baker: You cannot bring one here to go upon the stand and say that you could do it, under that statute.

Mr. DICKINSON: I think we could bring them.

By a JUROR: What is the height of a freight car?

A. I should say it would be ten feet. I could not say exactly.

Q. On the south side there, to have one of those pillars start from the south side of River street, and to extend into the Michigan Central yard, for your freight cars, could they not back up on that structure just as well? A. Not as well. They might if we built to span only one track, but the difficulty about that in addition, would be this: The Michigan Central claim they are going to build freight-houses on the front of their ground.

Q. But independent of what they pretend, the question is whether you can back up cars up onto that structure?

A. They could not very well; they would have to curve to get in.

Q. River street is perfectly straight.

A. I understand that, but if you look at the Michigan Central yard you will see their track has to curve.

Q. Not on River street. It is perfectly straight alongside the

fence.

A. They have to get in there by a curve.

Q. But it is a perfectly straight line.

A. When you get this side of it it is occupied by freight.

Q. What is the width of a freight car?

A. You have to have about 13 feet; if you have two tracks they have to occupy 13 feet for one car, and then the other one 13 feet.

Q. Then they could back out onto that structure, which is to be 35 feet; they could easily, taking the base of the span, back up abreast?

No answer.

Mr. Dickinson: Have you not stated yourself, Mr. Joy, that in London they run in three stories of cars, right over each over, into

depots?

A. One railroad company runs over another, and high enough to span it, but not lengthwise; they come into the city; one train comes in one direction and another in another, one crosses another so high up that it cannot interfere with the one below, but there is no two roads run along above another so that the trains run along lengthwise of the road, right above another, that I ever saw.

Mr. Baker: I want to make one statement to the jury here.
Mr. Dickinson may have thought that when I said that no
reputable lawyer in the city would sustain him in his posi-

tion, that I was personal. I did not mean to say that Mr. Dickinson was not a reputable lawyer. Mr. Dickinson stands very high in the profession, but he is very enthusiastic, and my proposition is that you cannot bring a reputable lawyer from the Detroit bar who will claim that we can condemn a right of way through the Michigan Central Railroad property as it is now situated, unless the Michigan Central railroad would consent to it, which they will not. That is the proposition that I make to this jury.

A JUROR: One thing we will have to have settled before we get to our deliberations, and that is whether there is a law which could

do so or not.

Mr. Baker: In regard to that, our supreme court has decided, in an opinion by Judge Campbell, that you (the jury) are the judges of the law and the fact, but that you can take the advice of the circuit judge if you desire to, so that we will ask you, as they make such a point as that, to call in the circuit judge and take his advice and judgment as to what the law is upon that subject.

A Juron: On that point we shall need him.

Mr. Baker: And I am perfectly willing to leave it to the circuit judge to decide, and if you agree with me that you would like his opinion, you can get it.

Mr. DICKINSON: I am sure I don't know what the opinion of the

circuit judge would be.

Mr. BAKER: Neither do I, but I am willing to leave it to him.

Mr. Dickinson: I do know that Mr. Baker rather insisted upon having a circuit judge give an opinion to a jury before, and that I insisted that the jury were the judges of the law and the facts, that a jury can read plain English, that the constitu-

tion did not contemplate that this jury should need any direction, because it is a tribunal of itself and can make up its mind, if it can read the English language, and if it takes advice, the supreme court of the State have held that the circuit judge has no power over you to give you a direction; if you take advice you do as you like, the jury is not to be charged.

Mr. Baker: That is a subject that we will bring up here hereafter, and I would not have much doubt, after you look the whole thing over, as to how you would decide it yourselves.

A JUROR: We will have to look up the law ourselves.

Mr. Dickinson: There is the plain English of the law.

Mr. Baker: When he says there is the plain English of the law, there is no strength and no truth in his position whatever, and he cannot even make an argument to sustain his theory of it.

Redirect examination by Mr. BAKER:

Q. You were counsel for the Michigan Central a great many years?

A. Yes, sir.

Q. And you have been familiar with railroad legislation in this State all that time?

A. Yes, sir.

Q. If you had the power to condemn a right of way across the Michigan Central Railroad property, would you have any objection to condemning a right of way along the margin of their property?

A. Any objection for what reason?

Q. For any reason.

A. I will tell you. The Michigan Central Company have a right to the use of all their grounds; their business is growing all the time; they say they are going to build freighthouses all the way along their grounds down to where they cross, within a reasonable time now. That is an objection to that, to our acquiring any of their depot grounds, even for that highway; they have a right to occupy their full front in any many many that

have a right to occupy their full front in any manner which they require, and if they need a freight-house on any part of these grounds they have a right to put it there. They may need every inch of it, and the law intends to secure every inch of that to them. They have put off of it their car shops and their freight shops, off

that ground, for whatever they wished to use it for, whether for

freight sheds, on the east or west side, they have a right so to use it; we have no right to interfere with it.

By a JUROR: As I understand the case, this viaduct for teams is a part of this condemnation of the Michigan Central?

A. No, sir; it is not.

Q. It is shown us as part of the plan.

A. That is no part of the matter before this jury. That may never be built. When we did talk about that—we did talk about it at one time—the Michigan Central refused to allow any land to be used, and they proved, as they thought, before that commission, that to take that little piece of ground below where the track comes across River street, down to the end of it, was worth to them \$200,000; where there was a single track, they proved it was worth to them \$200,000.

Mr. BAKER: On the south side of River street?

Mr. Baker: I desire to call your attention to that case. The railroad commissioner, or the State railroad crossing board in the first instance, and the railroad commissioner in the supplementary order, ordered the two companies to build a viaduct for teams?

299 A. Yes, sir.

Q. In the condemnation case brought by the union depot company to condemn a right of way for its elevated road in front of the Michigan Central property, was not this the position of the two companies; the Fort Street Union Depot Company desired to condemn a right of way for its elevated road?

A. Yes, sir.

Q. To build that in front of the property of the Michigan Central Railroad Company, and to build it in the street?

A. Yes, sir.

Q. The Michigan Central Company claimed that inasmuch as the board had ordered this viaduct for teams to be constructed, they were entitled, as a part of their damages, to compensation for the strip of land that would be necessary to take across the crossing there off of their property for that purpose; but that question was argued and submitted to the commissioners, and they decided that in the condemnation proceedings the Michigan Central Railroad Company was not entitled to any compensation for building the viaduct for teams?

A. They didn't consider that.

Q. They didn't award any damages for that?

A. No, sir.

Q. So that the depot company condemned a right of way to build its elevated road?

A. And nothing else.

Q. If this viaduct for teams is erected it is to be erected under the order of the city authorities, at the expense of both?

A. Yes, sir.

Q. That is, it is a burden upon the Michigan Central just as much as it is upon the depot company?

300 A. That is the position exactly.

By a Juron: Do I understand that the commissioner has condemned that driveway on the Michigan Central, if necessary?

Mr. Baker: No, sir; they do not condemn it at all. They just cover a right of way to build the elevated road there. The railroad commissioners and the railroad crossing board have ordered both companies to put that viaduct in there. They have ordered the Michigan Central to do it, and this company. It is an enterprise of their own; it is separate from this.

A JUROR: Was not that one of the conditions of the crossing

Mr. Baker: Certainly. The crossing board has ordered that to be done, and the supreme court has sustained it; but the only consequence it is here is that we show the completed plan, how it is to be constructed; but when that comes to be built it is to be built by these two companies, under a contract let by these two companies, and in which the two companies jointly will be required to pay any damage that will be done by the viaduct. Nobody claims it could be done without the viaduct; that is to be done, but it is not to be done by the union depot company a one; there is somebody else that has got to pay one-half of every dollar that it costs, one-half of every damage that it does.

Mr. DICKINSON: That is a fair statement of Mr. Baker.

A JUROR: If it had to be done as one of the conditions of the crossing.

Mr. BAKER: It is not put in that shape; he simply grants an order that it be done, and at the same time approves the map.

Mr. Dickinson: It is made a condition of the elevated structure.

Mr. Baker: It is not made one of the conditions. The Michigan Central railroad insisted upon having a crossing of that kind, and they signed an agreement; that has not been put in evidence yet, but they signed an agreement that this could be used and all that sort of thing, and they are undoubtedly under a legal obligation; in fact the supreme court has decided that that has got to be built by these two companies; there is no question about it; but it is no part of this case, it was no part of the case before Mr. Hecker and the other commissioners, and when they looked it all over and examined it fully, they excluded it.

Judge Chipman: Where is that agreement?

Mr. Baker: It is in existence. It is in the petition and in the proceedings.

Judge CHIPMAN: Will you bring it in here?

Mr. BAKER: Yes, sir.

Mr. Dickinson: Let us have that in the morning?

Mr. Baker: Yes, sir.

(By Mr. BAKER:)

Q. Upon what basis or for what reason do you say that this elevated road will compare with the New York elevated street railways?

A. It is for passengers largely, and has its locomotives, uses loco-

motives, uses passenger cars, does the same kind of business very largely, runs along a street as they do, burning coal, in every respect a railroad, a railroad with locomotives, cars and carrying passengers, just like this.

Q. It is the same gauge?

A. Yes, sir.

302

Q. Only the locomotives are a little larger here?

A. They are a little lighter there.
Q. And the cars are not so heavy?
A. They are not quite so heavy.

Q. But they are locomotives?

A. Yes, sir, burning coal as we do, in every respect.

Mr. Dickinson: You don't mean burning the same coal; they use anthracite?

A. Under the law, we have got to use anthracite here.
Q. But they don't use it yet, they use bituminous coal?

A. Not vet.

Q. They use bituminous coal on all the lines that enter here?

A. They do now, but they won't.

Q. In New York they have never used anything but the anthracite, have they?

A. I don't think so.

Mr. Baker: The ordinance there requires them to use anthracite coal?

A. Yes, sir.

Q. And they have an ordinance here which will compel you to do the same here?

A. Yes, sir, we will have to do it here.

Mr. Dickinson: There is not a word about anthracite coal.

Mr. BAKER: But that is the result of it.

Mr. Dickinson: They have an ordinance in New York providing that they use anthracite coal; it is in their charter; but your charter does not provide it, nor does the ordinance here.

Mr. BAKER: Under this ordinance, would it be possible to operate

this road without using anthracite coal?

A. I don't think it will.

Q. That is, it will be a violation of the ordinance to use bituminous coal on your elevated road?

A. Yes, sir, and we should be liable to a \$100 fine for every time we used it, and perhaps imprisonment to the men.

Q. There is some difference between these roads as to the amount of traffic; the trains are almost constant in New York?

A. I think they run every minute or so there.

Q. It will be some years before there is such a traffic on this road?
A. Yes, sir. The elevated roads, with the five-cent fare, Mr. Gould told me, earn more than the entire business of the Pennsylvania Central road, on the whole system.

vania Central road, on the whole system.

Mr. Dickinson: Why is there a mortgage for \$40,000,000 on it?

A. I cannot tell you that. It earns more money from passengers than the entire system of the Pennsylvania Central Company earns from passengers, and they run all day.

Mr. BAKER: That is the elevated street railway in New York?

A. Yes, sir.

Q. In testifying about the Pennsylvania Central coming in here, as I understand you, the Pennsylvania Central is an old road and a very rich one?

A. Yes, sir.

Q. As far as the mere matter of expense is concerned, they could build a line—they could raise any amount of money?

A. They could raise any amount of money.

Q. But as a practical railroad scheme, would such business as the Pennsylvania Central could obtain here justify any such enterprise on their part?

A. No, sir; they never would do it unless they could get into the

union depot; they would never come here.

Q. If the Pennsylvania Central comes here, must it not be in some union depot provided for them?

A. Beyond a'l doubt.

Q. On the other trial did you hear any particular contention on the part of Mr. Backus or his counsel, that the margin of the Michigan Central property could be taken?

A. I don't know as I did; I don't think I did.

Q. They contended generally that you ought to come up there through their property?

A. Up through the Michigan Central grounds.

Q. But the exact location of the ground was not insisted upon?

A. It was not mentioned at all.

Q. Do you know anything about the elevated road purchasing property down in Louisville—the Louisville & Nashville road?

A. No, sir; I don't.

- Q. All you know about it is that an elevated road does run along the street there?
- A. Yes, sir; and right in front of the stores and buildings in the street.
 - Q. Does business go right on along that street?A. Yes, sir; under it, on the levee, all the time.

Q. What kind of property is situated along the street?

A. Business property all along there. I cannot tell what business they do, but stores are occupied all along there.

Q. It is store property?

A. Yes, sir; I don't think I noticed any manufactures there, but it is occupied with brick buildings all along, and they run right close in front of them, but it is all open underneath.

Q. The Pennsylvania Central railroad comes into Jersey City on a public highway, with a line of railroad, a track or two in the center of the highway?

A. Yes, sir.

Q. And with a passageway on each side?

A. Yes, sir.

Q. And houses on each side?

A. Yes, sir.

Q. And a large number of cross-streets?

A. Yes, sir.

Q. They come right up along the New York harbor?

A. Yes, sir.

Q. And right through the heart of the city?

A. Yes, sir.

Q. Right across the main business street?

A. Through the center of the city, like running down Woodward avenue, right in the heart of the city.

Q. That necessitated a large number of grade crossings?

A. Oh, yes, a hundred and more; there must have been more than a hundred.

Q. And the elevated road that has been built there has simply raised the road up in the highway, so that those grade crossings are avoided?

A. Yes, sir; they all go underneath.

O. They leave height enough there so that traffic can go right

on under the elevated road?

A. Yes, sir, and my impression is, and I don't think I am 306 mistaken, that it spans the whole street, so that the street, the same as it was before, is used there.

Q. And it may be as in some of the streets in New York, if it is a wide street, there may be a passage on both sides in addition to the passage of the elevated road?

A. It might be so.

Q. That is, the elevated road does not span the whole street; the

posts are set 40 feet apart, there is a street on each side?

A. Yes, sir. On some they could not span the whole street, but where they can span the whole street and leave the whole street open, they do so.

Q. You have not been an officer or connected with the Michigan

Central railroad for a number of years?

A. Twelve or 14 years.

Q. Were you employed by them to argue this tax question for them at Lansing?

A. No, sir, not at all.

Q. Did they know you would make any argument?

A. No, sir, I didn't go there for that purpose. Q. How did you come to make an argument?

A. Simply because I sat by there and heard the arguments made on the other side, and it struck me that there might be some danger of the Michigan legislature passing an unconstitutional law, which they have agreed not to do, involving the Michigan Central in litigation which they ought not to he involved in. I did not think it was right, and therefore I expressed myself so.

Q. Did you go on and state the early history of the Michigan

Central?

• 307

A. I stated the whole history of the Michigan Central from the beginning, how the clause relative to taxation happened to be placed there, and the necessity the State were under for selling the road; I gave the whole history of it and the whole negotiation.

Q. Will you state in that connection, whether or not it was an easy thing to get the money with which to buy the Michigan Central of the State?

A. It was with the utmost difficulty in the world. We got the charter in the best shape in which it could be obtained. We then went east to consult the parties whose names were in the charter, whom we had supposed would take it. We had regotiation with them, out when they came to look at the charter and see what they had to do, they declined to do it. We had then to get up another company and a different set of men.

Q. How long a time did the legislature give you?

A. Six months, and it took us the whole six months to do it, and it was not until the last day of the six months that we got the stock taken. The new company came in; we discussed it with the old ones and the new ones; we got finally a new company with whom we thought we could carry the thing through and get them to take the stock, and we then arranged with the old company to subscribe to the stock as originally intended, and assign it to the new parties who agreed to take it; and it was with the utmost difficulty that we could get it taken then; we could not have got it taken at all but for the tax clause, which left them not to be taxed in any municipality and town through which they might run.

Q. How big a town was Detroit then, in 1846? A. About seven or eight thousand people.

Q. How big was Chicago?

A. It was not so large as Detroit at that time. In 1838, I
308 was in Chicago when there was about 2,500 people there, not
more than that. Up to 1846 Detroit was in the lead. By
1849 or 1850 Chicago was a little bit larger, but before that time
Detroit was ahead of it.

Q. Did anybody dream at that time that in a few years there

would be the great city of Chicago?

A. No, sir. I will give you a little history. Mr. Brooks, who was the engineer who built the Michigan Central road, lived in Detroit; he and I together were in charge of the Michigan Central here and everything connected with it. The Michigan Southern road was built out somewheres in the vicinity of Hillsdale, which was by its charter to have been extended, to connect with the Michigan Central at Niles. We were afraid that some other company would take that road and build a rival road around to Chicago, and we could buy the property for \$500,000; that was the price the State asked for it. Mr. Brooks and I conceived the idea of inducing the Michigan Central road to buy that road for the purpose of obviating a rival road at an early day around Chicago. I got Mr. Brooks, who was the engineer, and who had become well acquainted with this country, to write a letter to the officers of the Michigan Central road in Boston, and I agreed to take that down to them and advocate the buying of that road. Mr. Brooks in that letter as one of the arguments why they should buy that road, made use of this

expression in regard to Chicago: "Chicago is not a very large city now, but within 20 years there will be 200,000 inhabitants in Chicago." That was one of the arguments I had to use in favor of our controlling the travel between Chicago and the East. Well, I got the stockholders together. One of them, an old gentleman by the

name of John C. Greene, who lived in New Jersey—I had to go to see him in New York—when I came to that clause in the letter he said, "Mr. Brooks is as wild as a hog; it destroys my confidence in his judgment," and we could not get a dollar of his to buy the Michigan Southern road.

Q. It discredited it all around?

A. Yes, sir; because it made that prophesy. He said, "He is perfectly wild, it has destroyed my confidence in his judgment," and I could not do anything with him. But soon after a company did take it and we did build another road around to Chicago.

Q. From your knowledge of these depot grounds in Chicago and St. Louis and other places, could you tell us whether five acres is

any more than a company ought to have?

A. For passenger purposes, no, sir; it is a small ground.

Mr. Dickinson: There is no doubt about that. We concede that

five acres is about right.

A. I am acquainted with a great many station grounds, and, while I have not measured them, except with the eye, and while I know them very well, and some of them I bought the grounds for, I don't think there is any passenger ground in any city in the world, and doing a business that we shall do, that has a depot for passenger business less than we take, and there is no company in Kansas City or Chicago or any large city that has not as much ground for freight and passenger purposes, and they must have it.

Q. Some reference has been made to the fact of the depot on Forty-second street, that the depot of the New York Central road in

New York was formerly downtown.

A. That never was any further downtown. They use- to haul their cars down with horses to below the tunnel.

Q. That is Chambers street?

A. I forget the name. That was done to the Madison Square Garden. I think what afterwards became the garden there.

Q. Did a railroad ever run down there?

A. No, sir; but a track was laid down there and horses use-to draw the cars back and forth.

Q. Locomotives did not go down there?

A. No, sir.

Q. When that depot was built, would it have been practicable or a reasonable railroad scheme in New York to have built an elevated road and put that depot away downtown, considering the value of

the property there and the situation of the town?

A. As I take it, the New York Central, with the business that they do, could never have a station high up in the air to do it, and they could not go down there on an elevated road and run down into a passenger depot or a freight depot.

Q. Do you think that the growth of this city has been such that the Michigan Central depot ought to be moved further out?

A. It would be fatal to the city and to the road to move it further

out.

311

- Q. Is it a reasonable proposition, as far as the city is concerned and these companies are concerned, to locate a depot on Third
- A. Yes, sir, it is reasonable and right. It is a thing for the interests of the city and the interests of the country, and for everybody that wants to come in from the country, or go from the city into the country.

Q. Has this property down there got the value of Woodward Ave-

nue property.

A. No, sir, it is cheap property down there.

Q. The plans in evidence here provide for two tracks in front of the property of Mr. Backus, and then for three tracks?

A. Yes, sir.

Q. Will you state what use can be made of a third track from

that point in?

A. Sometimes it occurs that there comes in here a large number of people on excursions from the country. When they do come on a large excursion there may be 15 or 20 cars; they have to be divided into sections, and one section may run in on one track and another section on another track; at the same time there may be a passenger train in the depot that wants to go out; therefore when you get up there you need three tracks, not because you want to use three tracks all the time, perhaps, but because when trains come in there may be some going out on that section, and you may have to run in on one track and another and divide your trains, while one is coming out on the third.

Q. Is that the use that will be made ordinarily of the third track?

A. That is all.

Q. It will not be used as a part of the railroad yard where you make up trains and do switching?

A. Not at all.

Q. This strip of land that the Detroit, Lansing & Northern sold to the Michigan Central, is it a strip of land which ran through the Michigan Central road?

A. Yes, sir, through the middle of it now.

Q. And it had been originally acquired by the Detroit, Lansing & Northern, when they commenced to use the property of the Michigan Central? 312

A. Yes, sir; I sold it to the Detroit, Lansing & Northern

myself; I think it is 60 feet.

Q. We will find out just how many feet it was from some other source. But the Detroit, Lansing & Northern having decided to join this enterprise and come into this depot, had no further use for that, and they sold it to the Michigan Central for \$80,000.

A. Yes, sir, I think that is the price.

Q. It is the river-front property, and extends from River street through to the channel bank, like all other river property?

- A. Yes, sir, something more than 300 feet deep, 350 perhaps.
- Q. That is to the margin of the river?

A. Yes, sir.

Recross-examination by Mr. Dickinson:

Q. At the time you organized the original Detroit Union Depot Company, you were contemplating then that the Grand Trunk would come in with you?

A. Yes, sir.

Q. And subsequently, after you organized the Detroit Union Depot Company, the Grand Trunk bought the Detroit, Grand Haven & Milwaukee station ground?

A. They bought the Great Western road in Canada, and that be-

longed to the Great Western road and came in with the other.

Q. That was then about 1885?

A. I don't remember the time.

Q. It was subsequent to the formation of your company when the Grand Trunk refused to come in?

A. It was subsequent to the time we got interested in it

and bought the property.

Q. Up to the time the Grand Trunk road bought the Great Western, the Grand Trunk road, with all its business, came into the Michigan Central grounds, didn't it?

A. No, sir: the Grand Trunk then did a through business by the way of Port Huron, and they used to come in at the junction

to Detroit; the through business all went the other way.

O. So far as it came to Detroit, it came in the Michigan Central

ground and left there?

A. Yes, sir.

Q. At the same time the Flint & Pere Marquette used it and came clear in at that time?

A. No, sir; the Flint & Pere Marquette used to use the Detroit & Milwaukee depot.

Q. But at this time?

A. They came in there while I was president of the Michigan

Central road, they were there.

Q. At the time you formed the old union depot the Grand Trunk road was to come in with you; have you not said in your direct examination that the reason they did not come in here is, because they bought these grounds up here, and before that were they not coming into the Michigan Central?

A. They were; we had progressed a good way with the old

union depot company before we got the charter.

Q. I only want to show that they came in there, the Grand Trunk and the Flint & Pere Marquette.

A. Yes, sir; they did.

Q. And the Detroit, Lansing & Northern did?

A. Yes, sir; the Flint & Pere Marquette and the Detroit,
Lansing & Northern and the Michigan Central and the
Great Western all came in there.

Q. And the Grand River Valley?

A. That is a good way out.

Q. But the passenger business came into the Michigan Central?

A. Yes, sir.

Q. And the Grand Rapids & Indiana, so far as they ran trains here?

A. They didn't come into the city.

Q. Where did the Eel River road come in?

A. Not at all.
Q. Where did the Butler road stop?

A. It agreed to run around the Detroit & Milwaukee.

Q. And they found that it could not come in there conveniently?

A. That was the reason they formed this organization.

Q. The reason it was discommoding the Grand Trunk was because the Grand Trunk had one track?

A. I think it was because they had not ground enough to accom-

modate it.

Q. But they had but one track running out to the junction?

A. That is true, they had but one track.

Redirect examination by Mr. BAKER:

Q. You say the Wabash ran around there?

A. Yes, sir.

Q. Could it do business satisfactorily around there?

A. No, sir; not at all.

Q. Why?

315 A. Simply because when they got around there the road was so embarrassed by the number of trains that ran over it and the number of cars they had to handle around there, that they would not allow the Wabash trains to run in at all, but they would run to the horn, as it was called, and when it was convenient for them to haul cars in they would send out a switch-engine.

Q. The Wabash had second place all the time?

A. They had not a place at all.

Q. But their interests were subordinated?

A. To everything else.

Q. Do you know whether the Detroit, Lansing & Northern and the Flint & Pere Marquette have ample facilities now on the Michi-

gan Central?

A. The Michigan Central have always said they could not accommodate them and they must get out; they have said that for years, and they have been in a perpetual difficulty down there nearly all the time.

Mr. Dickinson: They are competing lines with the Michigan

Central?

A. Yes, sir.

Mr. Dickinson: Mr. Joy, I wish you would bring up or send up the agreement of the Michigan Central with the union depot company?

Mr. Baker: I will put all that in evidence.

Adjourned to Thursday, June 18, 1891, 2 p. m.

316

THURSDAY, June 18, 1891-2 p. m.

THOMAS J. HATSWELL, sworn in behalf of petitioner.

Examined by Mr. BAKER:

Q. Where do you live?

A. Saginaw, east side. Q. How long have you lived in Saginaw?

A. Nineteen years.

Q. What is your business?

A. Master mechanic of the F. & P. M. road.

Q. How long have you been the master mechanic of that road?

A. Fifteen years.

Q. As master mechanic, is it your duty to look after the locomotives on the road?

A. Yes, sir.

Q. Do you know how to build a locomotive?

A. Yes, sir.

Q. Do you know how to operate one?

A. Yes, sir.

Q. Will you state as briefly as you can to the jury the present devices that are used upon locomotives for the purpose of avoiding smoke and cinders; go on in the first place and state how you construct a locomotive in reference to that part of it?

A. We consider at the present day what we call the extended smoke arch to be the best preventive against the throwing of

cinders.

317

Q. Where is that smoke arch?

A. On the front end, and to decrease the smoke to as low a minimum as possible, we use in the fire-box of the engine a brick arch; it is carried on arch pipes; the water circulates through the pipes; we put that brick arch from the flue sheet over

the fire, so that from the top of the brick and what we call the crown sheet or roof of the fire-box, it varies according to the size of your engine; in the case of the engines we use on our road we have from fifteen to seventeen inches from the top of the brick to the bottom of the crown sheet.

Q. The fire-box is at the rear end of the boiler?

A. Yes, sir.

Q. Usually in a square form?

A. A rectangular form.

Q. And in the bottom of that fire-box is where the coal lays when it is being consumed?

A. Yes, sir.

Q. About how deep is a fire-box up and down?

A. They vary from 50 to 64 inches.

Q. How wide are they?

A. Thirty-four inches wide.

Q. This fire box is situated at the rear end of the boiler?

A. Yes, sir.

Q. How long is the boiler usually on an ordinary engine?

A. The boilers without the smoke arch are 16 feet 18 to feet long.

Q. Is the boiler in cylinder form usually?

A. The barrel of the boiler forward of the smoke arch is in cylinder form.

Q. Does that boiler consist of quite a number of flues that run through it?

A. Yes, sir.

- Q. About how many flues are there in an ordinary locomotive boiler?
- 318 A. The testimony I am giving in regard to the dimensions of locomotive boilers is the dimensions in use on our road.

Q. They make them of different dimensions?

A. Yes, sir; the dimensions I am giving are about the general dimensions that we are using on our road.

Q. Take the ordinary locomotive on your road, how many flues

are there that run through it longitudinally?

A. They vary. We have some boilers with 117, and some with

Q. Do those flues exceed the passages through which the smoke and fire proceeds, with which you heat the water?

A. Yes, sir.

Q. How is the brick arch constructed in the fire-box? Just describe that if you can.

A. The fire-box is in a rectangular form.

Q. Here is a cross-section of it (showing diagram).
A. That is a section, through the fire-box; this represents the brick; the brick we use are four inches thick and eight inches wide. You see that runs up there 32 inches, and there is 28 inches, and here is the bottom flue; this is a place to represent the fire-door where the coal goes in; the grates in the fire are here; all the fire goes up from here and passes over this brick arch, and has gone through the flues

Q. Are there any flues below that arch?

A. Not any.

Q. The arch commences, then, at the bottom of the boiler?

A. The top of the arch is supposed to be four inches below the bottom of the lower flue; that is our standard for putting it. 319 Q. So that the entrance to the flues is all above that arch?

A. Yes, sir.

Q. (Using two books.) Then, as I understand it, suppose those two books-the space between those two books-represents the firebox, and the end of the boiler stops here; this brick arch is situated substantially, not exactly, but substantially in that form?

A. Yes, sir. Now the jury can look at the back end of the boiler;

that is the position of the brick arch.

Q. Here is the fire-box where the fireman throws in the coal?

A. About there.

Q. And the fire starts here and comes around this arch here to go into the flue?

A. Yes, sir.

Q. What is the object of that brick arch extending out over the

coal, over the fire? I show you a diagram; it is a cross-section of it looking at it from the side.

A. Yes, sir.

Q. This represents the ends of the brick cut right in two?

A. Yes, sir.

Q. And it is supported, as I understand you, on tubes in which water circulates?

A. Yes, sir.

Q. What is the object of having that arch there?

A. To prevent an accumulation of smoke in the front end; we have then to beat up the cinders; as the engine is working the coal is consumed; the cinders that are formed in the place passing in a

direct line through the flues, impinge against this brick arch, 320 and the brick arch, when it becomes hot, helps to ignite the gases, and it does away with and helps to consume this dense smoke, and it retards the direct action of the smoke through the flues, so that the longer we can hold the heat in going through the flues, the better combustion we arrive at and the better results we get from our fuel.

Q. Do you have a draft that comes through the coal in the bot-

tom?

A. We have a damper in the front here and back, that lets the

air through the grates and through the coal.

Q. In addition to that, is any air emptied for the purpose of increasing the combustion as the smoke goes around that arch?

A. We don't.

Q. Can it be done?

A. It is done.

Q. By leaving the door open do you increase the consumption? A. We have a device on the passenger engines that acts as a deflector; in the ordinary locomotives the door is swung open on a foot-board, the coal is put in and the door is closed; now I use a device, experimenting with it, and it works very satisfactorily; the door is hung on the inside of the fire-box and closed on the inside, and opens right in the fire-box; the shape of that door makes a deflector when it is open, so that it throws the air right down onto the coal, and we think that by introducing that oxygen in there it ignites with the gases, and we do away with that black smoke.

Q. Now, that is the fire-box part of the engine. Will you tell us now what devices have been adopted at the other end of the boiler, after the smoke goes around this arch and goes

through the flues 15 or 18 feet, whatever it may be, to the end of the boiler; will you tell us the present method of construction, with reference, of course, to the subject of disposing of the smoke and cinders?

A. We have what we call a deflecting plate; of course the boiler is round, and we have a deflecting plate that comes off from 12 to

20 inches, from the end of the flues.

Q. Let me ask you a question right there. Here is the end of the boiler; supposing it is round, is that deflecting plate anything

more than a piece of iron or plate, that hangs down over the front of the boiler like that?

A. We make it of No. 10 iron.

Q. It is a sort of plate that hangs like that, just beyond the end of the flues?

A. Yes, sir.
Q. What is the object of that?

A. To stop the direct action of the cinders going through and to squeeze the draft through the flues.

Q. As cinders come through the flues do they strike a bit against this deflecting plate?

A. Yes, sir.

Q. They go down under the edge of that plate?

A. Yes, sir, they come down under the bottom of the plate.

Q. Do they open into a box at that place?

A. Yes, sir.

 Q. About how big is that, on your locomotives?
 A. We have from 44 to 56 inches in diameter, and 40 inches long, and the netting will take up about one-third.

Q. I have not yet come to that. As the cinders come out and strike against this deflecting plate, they revolve round and get into this box?

322 A. Yes, sir.

Q. Does the smokestack go out of that box?

A. On the top of it, yes, sir.

Q. At the front end of it, or close to the boiler?

A. Close to the boiler.

Q. Is there anything in that smokestack for the purpose of increasing the draft, or that is used for that; what have you in there to create a draft?

A. The exhaust pipe of the engine.

Q. Is there anything in that box; what, if anything, is put in that box, and where is it placed, for the purpose of arresting the

sparks and cinders?

A. We use what we call a three and a half by three and a half mesh netting, No. 12 wire gauge; there is angle irons riveted onto the sides of this smoke arch from the deflecting plate forward, and this netting is bolted onto those angle irons.

Q. Does that cover the entire — of that box?

A. The entire surface of the upper portion of that box.

Q. That is between the deflecting plate and the outer edges of it?

A. Yes, sir.

Q. How far from the top of that box is it with reference to the bottom; is it in the middle, or two-thirds of the way up?

A. About two-thirds of the way up.

Q. So that it extends from this deflecting plate to the opposite side of the box, so that no smoke can go through there without going through this netting?

A. No, sir.

Q. What do you mean by three and a half wire?

A. Three and a half inch mesh, that there is three and a half meshes to an inch: and then there is No. 12, that takes out 323 four wire-, No. 12 wire gauge, out of the inch, and that leaves the opening about three thirty-seconds of an inch square.

Q. What effect does this wire netting or sieve that extends over

this box have upon the cinders that come through the flues?

A. They arrest them.

Q. Where do they fall or stop?
A. They are deposited in the bottom of the box.

Q. Do they accumulate in any particular part of the bottom? A. All through the whole bottom; they commence more on the front of the boiler and bank up like that (illustrating).

Q. That is, they fill up in the corner?
A. They fill up forward in the front of the boiler, like that.

Q. (Showing a diagram.) Is the diagram I now show you a cross-section of the front part of a locomotive?

A. Yes, sir.

Q. Looking at it from the side?

A. Cut right in two.

Q. Is the lightest mark on this diagram the deflecting plate? Just point out the deflecting plate.

A. There is the deflecting plate there; it runs from there right

down.

Q. It is the lightest mark extended?

A. Yes, sir; from there, the top of the smoke arch, down. Q. Do these heavy marks at the left represent the flues?

A. Yes, sir.

Q. So that the smoke and cinders come out and strike 324 against this deflecting plate?

A. The cinders come out through the flues, strike this deflecting plate, pass down there, and then up out here.

Q. What does the semicircular marking represent?

A. The netting.

Q. The course of the netting?

A. Yes, sir.

Q. And this is open space here?

A. Yes, sir.

Q. What is this at the bottom?

A. A spark trap; that is for emptying the cinders that collect in the smoke arch.

Q. Do you mean that when the engine is in operation the cinders that are arrested in this netting accumulate in this corner?

A. Yes, sir; right there.

Q. And they gradually increase until it is necessary at some suitable place on the road to open that trap and let them out?

A. Yes, sir.

Q. Where is the exhaust on that? A. There (pointing).

Q. Discharging directly in the smokestack?

A. Yes, sir.

- Q. What effect has that upon the air in this box, in the flues and in the fire-box?
 - A. It creates a vacuum and a draft. Q. Through the entire locomotive?

A. Through the fire-box and the tubes.

Q. To what extent do these devices stop the emission of smoke and cinders from the locomotive?

325 A. They reduce the emission of smoke and cinders from a locomotive to the lowest minimum. That is the object of it.

Q. In the Saginaw country you have a great many saw-mills and planing mills and such things, I believe?

A. Yes, sir.

Q. Has the Flint & Pere Marquette any railroad there that runs into the vicinity of the saw-mills and planing mills?

A. Yes, sir.

Q. Have you a belt line in your city?

A. Yes, sir.

Q. Does that belong to your road?

A. Yes, sir.

Q. How many miles long is the belt line?

A. Nearly twelve miles round.

Q. Where does it run?

A. From what we call the east side right around the city, round the outskirts of the city.

Q. What sort of business does that road do?
 A. Principally lumber.

Q. Does it run to the different saw-mills and manufacturing institutions that surround the city of Saginaw?

A. All of them; it is in that vicinity.

Q. It is maintained and operated for the purpose of furnishing them railroad facilities?

A. Yes, sir.

Q. How long has that belt line been in operation? A. Part of it has been in operation for 16 or 17 years.

Q. And the rest of it?

A. It has been completed two years.

Q. Does the main line of the Flint & Pere Marquette road in Saginaw run near to or adjacent to saw-mills or planing mills? 326 A. Yes, sir.

Q. Have you a line to Bay City?

Q. Does the road at Bay City run in the vicinity of that kind of . property?

A. Yes, sir.

Q. In Saginaw, as I remember it, there is a large amount of made land, is there not?

A. Yes, quite an amount.

Q. Made of sawdust and slabs?

A. Yes, sir.

Q. Does the Flint & Pere Marquette road or this line run over this land?

A. Some portions of it.

Q. How near to a planing mill or a saw-mill does either one of those roads run there; how close to the railroad is there a planing mill or a saw-mill?

A. Six feet; six or eight feet.

Q. There are large quantities of lumber stored upon the docks and along the railroad in Saginaw?

A. Yes, sir.

Q. How close to the railroads do they pile lumber there?

A. From two to six feet; that is, it clears the coaches from two to six feet.

Q. I suppose an ordinary coach is nine to ten feet wide?

A. Yes, sir.

Q. In the operation of the Flint & Pere Marquette road, since you have been connected with it, to what extent have you avoided setting fire to this combustible property near which you run?

A. I don't know of a claim.

Q. Since your connection with the road has any claim been made against the company?

A. Not by any of those mills, to my knowledge.

Q. It is proposed, in this case, to build a railroad along River street; on that railroad the rails will be 23 to 25 feet, I think, on an average, about 24 feet above the level of the street; the rails are supported by a superstructure resting upon posts; that superstructure will be open so that there will be at least 14 feet in the clear from the bottom of the girders to the street; it is proposed to run such a superstructure along River street, with the posts resting at the edge of the curb, so that the superstructure will span the entire paved portion of the street; and in front of the property in question in this case a part of the way there will be two tracks, and a part of the way three tracks, but those tracks, or rather the ends of the ties upon this superstructure, will be nearly if not quite 40 feet from a brick planing mill that is being operated by Mr. Backus; he has a shaving-house, a building that comes down closer; it will be some six or eight feet, something like that, from the ends of the ties, and it is proposed to operate a railroad-four different railroad companies, your railroad in addition to others, will operate locomotives upon this superstructure by this property. What I want to know is this: Will the presence of locomotives, properly constructed according to the present state of the art, and carefully and properly operated as they run up and down in front of this property, increase, in your judgment, the fire risk of this planing mill; under such conditions, will the presence of this road make it more probable or more likely that this mill will be consumed by fire?

A. I have had some past experience in such cases, and from the knowledge I have, it would not to any great

extent.

Q. It would not increase it?

A. No, sir, not from the experience and knowledge I have in regard to such cases

Q. State whether or not, when a locomotive is in operation, what-

ever escapes from the smokestack is thrown with considerable force into the air.

A. Certainly.

Q. That is, when the dampers are open and the locomotive is in operation, with the aid of the exhaust, the discharge from the smokestack is with considerable force, is it not?

A. That depends upon the conditions of service; it depends on

the speed, the grade, and the weight of the train.

Q. What is the fact where a locomotive is properly constructed and properly operated, as to its emitting sparks, or cinders that have life enough to set fire to anything?

A. With the present device, where there are no mechanical de-

fects, there is no great danger of setting fire to anything.

Q. Can any sparks or cinders, or live coal, get through this sieve, except they are small enough to get through these meshes?

A. No, sir.

Q. That is, it is so constructed that everything that goes through the smokestack has to go through this sieve?

A. Yes, sir.

Q. I suppose that what sparks or cinders do go through, if they were alive, they would go out before they strike the ground?

A. Yes, sir.

Q. The very fact that they are up in the air is an additional safety?

A. They would go out before they stopped going up.

Q. What kind of coal is used on your road?

A. What we call bituminous coal.

Q. Can you use anthracite coal in the same engines?

A. That is a question I do not consider myself capable of answering; I have not had experience with anthracite coal.

Q. Could you use coke in the same engines?

A. We could use it, but with what results I could not say. Q. You have had no experience with anthracite coal?

A. No practical experience with it.

Q. Nor with coke?

A. No, sir.

Q. You know something about the operation of that road?

A. Yes, sir.

Q. Do you have charge of the management of the engines on the road, as to where the engines shall go, and how long they shall work?

A. Yes, sir.

Q. That is, you have charge of the locomotive department?

A. Yes, sir.

Q. Would it be practicable to operate a union depot in the city of Detroit by changing the locomotives, say at a junction out in the suburbs, say at Delray on the Wabash, or at the junction on the Michigan Central; would it be practicable to operate a railroad and have engines there that were constructed for the use of anthracite coal or coke, to haul the trains in?

A. Yes, sir. 330

Q. There would be no difficulty, no particular delay in changing engines at such a place?

A. It would cause a small delay.

Q. How long does it take ordinarily to change an engine?

A. Three to five minutes.

Q. Can it be done in three minutes?

A. Yes, sir.

Q. Any less? A. Yes, sir.

O. If the tracks are suitable and the men prompt, it can be done in less - three minutes?

A. Yes, sir.

Q. To what extent can a locomotive be operated with the dampers closed?

A. They can be operated to a limited distance.

(). Did you ever have a place on the Flint & Pere Marquette road where they were operated with the dampers closed, where that was the practice of the company?

A. Yes, sir.

Q. Where was that point?

Q. Which side of the station?
A. West.

Q. The depot in Flint is near the Flint river?

A. Yes, sir.

Q. As you went west across the bridge over the river, did you formerly go through a lumber section?

A. Yes, sir.

Q. Where the lumber mill of H. H. H. Crapo and Mr. Mac-Farland, and a number of other large manufacturers were situated ?

A. Yes, sir. 331

Q. I suppose years ago wood was used on your road?

A. Yes, sir.

Q. Will you state whether it was practicable to operate the road going out of that station with the boxes closed?

A. It was done.

Q. How far did you run; how long was this dangerous section?

A. About a mile.

Q. Did you have charge of the way engineers operated the engines through that?

A. Yes, sir.

Q. Did you have any difficulty in having them operate there with the dampers closed?

A. No, sir.

Q. About when did you cease to use wood on that road?

A. 1877; we commenced using coal in 1877, fourteen years ago.

Q. Bituminous coal?

A. Yes, sir.

Q. Since you have used bituminous coal, has it been necessary in running out of Flint to have the dampers closed?

A. No, sir.

Q. It was necessary before, because of the fact that you were using wood?

A. Yes, sir.
Q. The union depot company proposed to erect, or is erecting, a union passenger-house at the corner of Third and Fort street west in this city; they will have trestle-work along River street, and two

or three tracks running out of this depot down to the old 332 union depot grounds, to property that is situated at the foot

of Eighteenth-and-a-half street; there is, I should judge, about a mile, possibly a little more than a mile, of this road; there will be about half a mile of it that will run along River street, with manufacturing establishments on the north side of the street, and the Michigan Central railroad with a railroad yard on the south side of the street. Will you tell this jury if it would be practicable, if it were necessary to do so, to operate that end of these railroads that are to terminate there with the dampers of the engines closed?

A. Yes, sir.

Q. What would it be necessary for the engineers to do in order to do that; what precautions would they have to take?

A. They would not have to take any precautions. They might

have to open their furnace door, possibly an inch.

Q. But what precautions would they have to take in approaching such a place?

A. At the end of a trip?

Q. Yes.

A. They wouldn't have to take any.

Q. If it was at the end of a trip, would they have to have an extra supply of steam or fire?

A. No, sir.

Q. If they were abou at the end of their trip, with such steam as they ordinarily have, c uld they go on into the depot with their train?

A. Yes, sir. My testimony is based on our ordinary trains on our road, the road which I am connected with.

(By Juron:)

Q. What do you mean by ordinary trains?

A. Five coaches to one train; that is our ordinary train.

(By Mr. BAKER:)

Q. Your ordinary trains are five passenger coaches?

333 A. Four and five.

Q. Would there be any difficulty in going in with a number of other coaches?

A. No; they would have to work their engine a little harder up

the grade and consume more steam.

Q. I suppose there are different supplies of steam maintained in an engine?

A. They might have their fire in the furnace under a little different conditions with a heavier train than with a lighter one.

Q. Suppose a locomotive was standing in the depot, about to go out, waiting for the passengers to go aboard, would there be any practical difficulty in having steam enough on so that they could run out on this trestle-work and outside of the dangerous locality, if one existed there, with the dampers closed?

A. Yes, sir.

Q. There would be a practical difficulty?

A. I don't know whether they could; I understood, would it be practicable for them to run out, as I understood the question.

Q. How far do you think they could run, as a practical ques-

tion?

A. A mile.

Q. Would there be any difficulty in running a mile?

A. No, sir.

Cross-examination by Mr. Dickinson:

Q. Have you been connected with any other road except the Flint & Pere Marquette?

A. Yes, sir.

Q. Were you ever connected with the Pennsylvania?

334 A. No, sir.

Q. What other road were you connected with?

A. The Lake Shore & Michigan Southern.

Q. Will you tell the jury the length of a passenger car, such as you have on your road?

A. Our passenger cars are from 45 to 60 feet.

Q. And what would be the extreme length of a train with five passenger coaches, with the locomotive?

A. About 425 feet.

Q. You include the spaces between the cars?

A. Platforms to be added.

Q. You don't give that in your 40 feet?

A. No, sir.

Q. And you think with that kind of passenger car you could run a mile in the depot, the old depot grounds, if it is a mile, with dampers closed, or open half an inch, did you say?

A. I said opening the door about half an inch or an inch; I mean the furnace draft, simply to relieve the suction on the fire-

box.

Q. Suppose you had double that length of train and weight of cars?

A. It would be possible to do it.

Q. With any more opening of the door?

A. No, sir.

Q. Are you speaking of running in at grade?

A. I understood the grade.

Q. What did you understand the grade that you were to run up?

25 - 55

A. I cannot say I understood the grade.

Q. That is what I am asking, whether you understood in your direct examination that you were running up at grade?

335 A. No, sir, on an incline. Q. Of how much?

A. I was talking because I knew what it was supposed to be, 50foot grade to the mile for a short distance.

Q. Did you, in considering that matter, take into consideration only your own locomotives and your own plan of locomotive?

A. Yes, sir.

Yes, sir.

Q. You don't take into consideration the locomotives, or plans of locomotives, of other roads than yours?

A. No, sir.

Q. Is it not the instruction to all engineers, in approaching a depot, in all the railroad business, to run in as far as possible with the dampers closed, now, in entering their depots?

A. There is no restrictions placed on engineers in regard to that; the orders to engineers are to run at all times, more especially around passenger depots, with the least possible amount of smoke.

Q. That is the general railroad instruction to all engineers of

locomotives?

A. Yes, sir, and the manipulation of those things is left to their judgment.

Q. The matter would have to be left largely to the vigilance of the engineers in any case?

A. Yes, sir.

Q. You never run out and see what your engineers do; you, as master mechanic, do you?

A. Oh, yes.

Q. As a matter of ordinary business? A. Yes, sir.

Q. How often do you go out?

336 A. I go out sometimes once a week, sometimes once a

Q. You keep a kind of supervision over it to see what they are doing?

A. Yes, sir.

Q. Every well-conducted road endeavors to see to it that in entering its depots and in entering inflammable property, and in any other cities, that they run in this way as far as possible avoiding danger from fire?

A. Yes, sir, that is true.

Q. And every well-regulated road so instructs and endeavors so to conduct its business?

A. I suppose so.

Q. Do you know of any other road that had your peculiar device for locomotives?

A. I don't know whether they use it exactly the same. are other roads that are using about the same device we are using.

Q. What other roads?

A. The Detroit, Lansing & Northern is one I know of.

Q. That enters here also?

A. Yes, sir.

- Q. Is the Michigan Central usually considered a pretty well-conducted road?
 - A. I don't know about that. Q. Do they use such a device?

A. I don't know.

Q. Do you consider the Pennsylvania road, take it for all in all, especially its eastern connection, we will say between New York and Washington-do you know it is reputed to be the best-conducted road in the country?

A. It was so reputed.

Q. Do they have this device? 337

A. I don't know.

Q. Do you know that the Pennsylvania road has tried 561 devices for smoke consuming upon their road?

A. Yes, sir.

Q. Has your device been offered to the Pennsylvania people?

A. No, sir.

Q. But it has all been a consideration in well-conducted roads, especially in passenger business, to avoid smoke and cinders?

A. Yes, sir; always has been with us.

Q. They are always reaching out with some such device?

A. Yes, sir. Q. You are familiar with the railroad business of the United States pretty well?

A. Some.

Q. You keep the run of it?
A. To a certain extent.

Q. Do you know the New Jersey Central?

A. I know there is such a road.

Q. You know that is a well-conducted road, the New Jersey Central?

A. I don't know anything about it. Q. Running out of New York?

A. I don't know anything about it except the name.

Q. A large number of passengers are daily conducted out of New York to various places?

A. I suppose so.

Q. Do you know of any one that has succeeded with a cinder and smoke consumer in avoiding cinders and smoke?

A. I have seen it advertised by some roads; I don't know 338 what roads, but I don't know personally.

Q. Do you know of any one that has succeeded except yourself?

A. I didn't say that I had succeeded.

Q. Do you know how many devices have been patented in the United States; have you given the subject any attention?

A. Not in that light.

Q. Is this your own invention that you have got on the Flint & Pere Marquette?

A. What we use on the Flint & Pere Marquette is the device that we by experimenting have arrived at the best results with.

Q. It is the best thing you can do with this?

A. We are using the best that we have arrived at so far. Q. You are constantly trying to improve it?

A. We are trying to do better.

Q. Do you have this device on all your passenger engines?

A. All of our engines.

Q. Both freight and passenger?

A. All our engines.

Q. Do you know why it is that the lumber that comes from the Flint & Pere Marquette territory to Detroit, comes covered with cinders?

A. I didn't know it came covered with cinders.

Q. How long have you used this device upon your road?
A. We commenced it nine years ago.

Q. Do you know why it is that since that and now the Flint & Pere Marquette lumber that comes in Flint & Pere Marquette cars comes in laden with cinders; that a cinderman is employed at every lumber yard to first clean the lumber of the cinders, as the

first duty of unloading?

339 A. In Detroit?

- Q. Yes, or any other lumber place. A. I didn't know that such was the case.
- Q. You don't think it could get that amount of cinders between here and Wayne, four miles or more, or between the junction and here?

A. I don't know anything about that.

Q. Do you know about the number of quarts of cinders that are taken out of Flint & Pere Marquette cars that come to Detroit every day?

A. No, sir.

Q. Do you know that from one to three quarts were taken from a train at the Central depot, when the cars were cleaned every day?
A. I heard you say so.

Q. In the other trial?

A. Yes, sir.

Q. You didn't know?

A. No, sir.

Q. You didn't listen to the testimony before; I suppose you went home?

A. Yes, sir.

Q. Inside the passenger coaches, and upon the coaches, upon the platforms, did you know that from one to three quarts of cinders, from those passenger coaches when they are cleaned, are taken, coming in from the Flint & Pere Marquette road?

A. Not to my personal knowledge.

Q. You have not succeeded in avoiding that difficulty?

A. I know we don't have any cinders in our coaches when every-

thing is in proper order, running from Manistee to Saginaw, a distance of 150 miles; I know we don't have any cinders 340 in our coaches running from Saginaw to Port Huron, a dis-

tance of 90 miles, because I am over that territory.

Q. If you have that device, you have one of the most valuable things in passenger railroading.

A. That is too broad a question.

Q. Is not the principal consideration in conducting a passenger business now, in excursion time and in summer time, especially when passengers are moving largely, to make them as comfortable as possible?

A. That is the consideration.

Q. You know one of the principal discomforts is smoke and cinders now, and that is acknowledged?

A. Yes, sir.

Q. Then if you have a device by which smoke and cinders do not enter the coaches when you are running your trains, then you have one of the most valuable steps in improvement that is known in the passenger business.

A. We reduce that; if we get it reduced to the lowest possible

point.

Q. But you say on the Port Huron passenger branch you have no cinders?

A. I say we don't have any cinders in our coaches.

Q. But your trains are run from Saginaw, and proceed over the Flint & Pere Marquette to Detroit?

A. Yes, sir.

Q. And this device works all the while?

A. This device is on the engine.

Q. And is specially worked all the while?

A. Yes, sir.

341

Q. And it works as well, or a little better, does it, with the dampers open than with them closed?

A. The dampers have no effect upon it particularly. Q. But with the draft?

A. The damper is for the admission of air to make the fire.

Q. You make your device work well?

A. If we didn't get any fire we would have no cinders. Q. Your theory is that you burn the smoke and cinders?

A. Oh, no, we don't pretend to say that we can do away with all the smoke.

Q. But the theory is that it does consume more than the old system?

A. Yes, sir.

Q. And does not that require a draft?

A. It requires a draft; it has to have a draft.

Q. So that it does not work if your draft is shut off?

A. Not so well.

Q. Now in the Saginaw business you are the master mechanic of the road, to whom claims are made when claims are made against the road for injury?

A. Fire claims?

Q. Any claims against the company.

A. There is a man named Edwin Sanders who has to do that, to look after that business.

Q. Are any claims for fire made to the master mechanic on your road?

A. Only through him. If there is any claim made for fire, we receive notification from him.

Q. I think your main passenger depot at Saginaw is a little outside of the city?

A. Oh, no; it might be; it is on Potter street.

Q. And there your passenger trains usually stop for Saginaw? A. Yes, sir.

342 Q. What is it run around the belt line?

A. The belt line consists of passenger trains. Q. You stop at streets and pick them up?

A. Yes, sir. Q. You also have on your belt line freight cars, to pick up the freight, and switching from the different yards?

A. Yes, sir.

Q. That belt line makes a switch connection for passengers, from the main depot?

A. It is used for passenger traffic between the east and west sides, and for freight traffic.

Q. Do the same locomotives drag the trains?

A. Yes, sir.

Q. You make up a train for the belt line, don't you?

A. We have one train that leaves Saginaw on the east side, that goes around the belt line, the same engine and cars that goes to Port Huron.

Q. That is for passengers?

A. Yes, sir.

Q. As to your freight business connected with lumber yards through there, is there any lumber yard there which your main line runs to, or is it your belt line?

A. The belt line is the main line.

Q. The main line apart from the belt line? A. Yes, sir.

Q. Where does the main line of the Flint & Pere Marquette at Saginaw pass through any lumber yard at Saginaw?

A. West of the river, on the west side.

Q. On the Saginaw City side?

A. Yes, sir.

Q. Where is your freight depot?

343 A. On Third street.

Q. On which side of the river?

A. East side.

Q. Your main freight depot is on the east side?
A. Yes, sir.

Q. Do you use the belt-line tracks on running on the west side?

A. Yes, sir.

Q. You have pretty good railroading in Michigan; you are more intimate with that than with the railroading of the United States generally; you have been how many years in Michigan?

A. I have been on the Flint & Pere Marquette 19 years.

Q. You are more familiar with the railroads of Michigan than with those outside?

A. Yes, sir.

Q. They are pretty well conducted roads that go here, aren't they?

A. The roads that I have been connected with; I have not been connected with but two roads, as I have mentioned.

Q. You have been about railroads some?

A. Yes, sir: I have been about.

Q. The roads of Michigan that come to Detroit are pretty well conducted, are they not? I want your judgment as a railroad man. I don't want you to be philosophically exact.

A. I might say that some was and some was not.

Q. I am not going to make you invidious and tell whom you think are not, but let me ask you if the general instructions of well-regulated roads are to enter cities and depots, or where there

is inflammable property, with this care, closed dampers as far as possible, to avoid the emission of sparks to set fire?
What would you say was the trouble, if in the course of one fiscal

What would you say was the trouble, if in the course of one fiscal year here there were 65 fires in the city of Detroit made from sparks from locomotives?

A. I should say there was some mechanical defect.

Q. Even in your device?

- A. I am not egotistical enough to suppose it perfect; I think the device we are using gives as good satisfaction as the majority of devices for that.
- Q. And yet all railroads are endeavoring to give the greatest comfort and avoid damages?

A. Yes, sir.

Q. And you would say that if that were true, that there were 65 fires set in Detroit from the sparks from locomotives, that they used defective devices, even with all care?

A. I said there was a mechanical defect.

Q. Is it not true that, with the best you can do, there is always more or less danger from a locomotive, and will be so long as a locomotive makes steam by fire. Of course you may reduce it comparatively, but don't you always think there will be more or less danger from a locomotive in passing inflammable material, so long as the steam is made or the locomotive power is generated with fire?

A. So long as you use fire in a locomotive the men have to use all precaution.

Q. It is a matter of vigilance all the while?

A. All the while.

Q. It takes a different construction of engine to burn anthracite coal from those using bituminous coal, does it not?

A. I have no experience or knowledge of the construction of

engines required for good practical results in using anthracite coal.

Q. Do you know of any locomotive in the world, anywhere, or any railroad operating a trunk line, for large passenger coaches, or standard coaches and the standard freight cars, that burns or can utilize anthracite coal in making steam so far as your knowledge extends?

A. My knowledge does not extend to anything except what I have seen. The Lehigh Valley uses anthracite coal to some extent,

and the Michigan Central does, I think, to some extent.

Q. Do you know whether they use anthracite coal in pulling their

heavy trains?

A. I don't.
Q. You know what they use in New York in pulling these street cars on the elevated roads?

A. No, sir.

Q. You don't know they use anthracite coal there?

A. No. sir.

Q. But it has a different construction of engine?

A. Yes, sir; what I have seen of it.

Q. How many engines do you think it would take to pull in, stand ready to pull in 38 trains every 24 hours, and pull them out for a distance of, we will say, two miles into Detroit, to change engines and to take care of 38 trains in and out?

A. Nine trains each way, two miles?

Q. How many engines would it take to serve those trains; you could not have an engine serving one train at a time, I suppose?

A. One engine would do it.

Q. One engine would serve all those?

A. Yes, sir.

Q. Do you know of any city in the world—of course it is a matter of desire on the part of the railroads to make as quick time as possible in the passenger business?

A. Yes, sir.

Q. And delays upon railroads, if delays are known to exist, injure the passenger business?

A. Yes, sir.

Q. Don't you know that it is a matter of irritation and aggravation, and so known to the railroad companies, for passengers to be detained in any city and going to their place of destination?

A. Well, no, I didn't know that.

Q. When a fellow is getting home and is delayed in getting into a town, you didn't know it created irritation?

A. How long would you want him delayed.
Q. I am asking you generally about the delay.
A. If he got snowed in or anything like that?

Q. If he got snowed in he would swear; and the railroad company is not at fault in such case. I ruled that a railroad should not be fined or blamed for any non-delivery of a mail when stuck in a snow-bank; so I am with you on that. Do you know of any rail-

road in any city in the world, with a direct line into a depot in the city, that changes its engines before entering the city?

A. I don't know.

Q. Do you believe that three or four great trunk lines entering this city will ever change engines outside of the city to get their trains in, stop and do it?

A. I don't know.

Q. Do you believe it will have to be done?

A. I don't know; but I said it was practicable to be done. Q. You said a moment ago that one extra engine would 347 serve 38 trains?

A. Yes, sir.

Q. I suppose that on the three tracks that enter, there are four independent railroads, and they both have the same time, or two of them have the same time, it would take two engines?

A. Certainly.

Q. And if there are three or four, that engine coming in and going out ten miles an hour, how long would it take?

A. They could make the schedule that it would take 38 engines

Q. But how long would it take this engine to run into the depot and dislodge its cars and detach its trains, and switch out, and get back to the place again, at ten miles an hour?

A. Two miles, that is 76 miles, and you said 24 hours?

Q. Yes.

A. I think it would run only about three miles an hour.

Q. But they don't run in all hours; I give you a margin of 24 hours; how long would it take a train?

A. Twelve minutes in, and 12 minutes out. Q. There would be some delay in the depot?

A. Give it 15 to pull it in and shove it out; give it 15 minutes.

Q. And you anticipate that it would drag the train out again in that 15 minutes, or take itself out again?

A. We pull a train three miles and pull it back again in 25 minutes, that is the schedule time.

Q. What is the time that you refer to?

A. In ten minutes.

Q. How fast do you run?

- 348 A. Three miles ten minutes, and they have got ten minutes to come back, and from the time it runs to one point and goes the three miles and comes around and back it is 25 minutes.
- Q. When sparks and cinders and smoke are emitted from an engine, is the tendency for the smoke and cinders to deflect and fall; take weather like this today (a dull, sultry day)?

A. A day like this it would have a tendency for the cinders to

deflect and fall.

- Q. Take any day, is the tendency of cinders to go down from the smokestack?
 - A. No, sir, they would go up; they have got to go up first.

Q. How many feet?

^{26 - 55}

A. I don't know.

Q. From the force of the emission from the smokestack, after that force is lost, the tendency is to fall?

A. It is so soon that you see these cinders come lighted that we

cannot measure it.

Q. What is the tendency of cinders after they lose the force from the smokestack, whether to rise or fall?

A. By the force it receives it goes up. Q. And then after it loses the force?

A. It has got to fall down.

Q. You have testified as to this elevated structure in front of Mr. Backus' property, and given an opinion, I suppose, as a railroad man, as an expert, as to the injury it will be to the property; did you ever have any experience in elevated-road practice before? A. No, sir; I did over bridges.

Q. But on an elevated structure like this, that is set upon stanchions?

A. My testimony was based on experience.

Q. Did you ever have any experience with an elevated structure like this?

A. And from the experience I have, the accumulation of cinders on an elevated trestle-work would be no more than on the ground. The cinders would only just have so much further to fall to the ground; that is the only difference.

Q. And they would have an opportunity to get into the upper windows, if the smokestack was above the windows, would they

not?

349

A. No, sir, I don't think they would. They don't go sideways they would go up and drop down.

Q. Don't go up sideways?

A. Unless there is a heavy wind.

Q. You have run out on engines and trains yourself?

A. Yes, sir.

Q. Don't you know that the smoke lays along and falls at the side for miles, so that you can see it from the car window on whichever side it is?

A. I have not lately.

Q. Do you tell this jury that smoke and cinders fall right over the back of the train?

A. Unless there is a strong wind.

Q. Suppose there is a wind from the river which would be blowing towards the Backus property, on that side of the elevated structure, and there were smoke and cinders, would the cinders be more likely to enter the windows than running at grade?

A. If there is a train coming in of our road, pulling an ordinary passenger car, and running over that road, running past 350 Mr. Backus' property, I should be willing to assert that if he

didn't see the train go by he would not know by the amount of cinders he would get in there; if he did not see it he would not know it went by.

Q. One of your trains?

A. One of our trains, that end of the route.

Q. But if there were cinders, would it be more likely to get in his upper windows than if he ran at grade?

A. I don't think it.

(). Where have you had any experience with an elevated road?

A. I never ran on an elevated road.

Q. Never observed the operation of one?

A. No, sir—in what respect?

Q. The operation of one upon trestles like this.

A. Running over it; it is nothing more than a long bridge.

O. It is on trestles?

A. It is just the same as running over a bridge. Q. It is the same as running over a bridge?

A. Yes, sir, I should say so.

Q. That is all? A. That is all.

Redirect examination by Mr. BAKER:

Q. You spoke of opening the doors of the fire-box an inch or a small distance for the purpose of aiding the draft. You didn't refer in that testimony to the dampers, did you?

A. No, sir.

Q. The dampers are at the bottom of the fire box, so that whatever air comes in at the dampers, goes through the coal?

A. Yes, sir. 351

Q. Above the coal is a door in which the fireman throws in his coal, and you can aid the draft somewhat by leaving that open or partly open?

A. Yes, sir.

Q. But of course when that is left open the draft is above the coal, and it has not so great a tendency to draw cinders from the coal?

A. No, sir.

Q. You have no knowledge as to the construction of the locomotives of the Michigan Central railroad?

A. No, sir.

Q. You have no knowledge as to the construction of the locomotives of the Grand Trunk and the Detroit, Grand Haven & Milwaukee?

A. No, sir.

Q. Have you any knowledge as to the construction of the locomotives upon the Lake Shore road?

A. Not at the present day.

Q. That is the road that runs from here to Monroe and to Chicago; you have no present knowledge?

A. No practical knowledge, none that I could testify to.

Q. You have knowledge more particularly of your own road?

A. Yes, sir.

Q. And you know generally that the Detroit, Lansing & Northern uses the same device?

A. Yes, sir, I was so informed.

Q. Do you know how the Wabash is operated?

A. No, sir.

Q. Do your engines run the entire length of your road from Monroe to Ludington without change?

352 A. No, sir.

Q. How often do you change engines on your through trains?

A. We change at Saginaw.

Q. Do your engines go through Toledo?

A. Yes, sir, on some of our trains.

Q. They go from Toledo through to Saginaw?

A. Yes, sir.

Q. Do your engines come into the city of Detroit?

A. One of our engines.

Q. Do your passenger engines come in here?

A. One.

Q. How is the rest of the service performed?

A. The Michigan Central Company furnishes the engines for the

Q. That is they haul all your freight in?

A. They haul all of our freight in, and all of our passenger trains in from Wayne, but one.

Q. What train is that? A. That is train No. 9.

Q. It gets here at what time?

A. About 9.20 or 9.40 in the morning.

Q. So that the train that leaves here for Saginaw, all of your trains with that exception change engines at Wayne?

A. Yes, sir.

Q. And they change again at Saginaw?

A. Yes, sir.

Q. Does the same engine go up to Bay City?

A. No, sir.

Q. Even to make the run up there you change engines?

A. Yes, sir.

353 Q. And the trains that go up to Ludington up there change engines at Saginaw?

A. Yes, sir.

Q. What is the fact about these lines generally, whether or not they frequently or at times on a trunk line change engines; do you know what the practice is?

A. They change; they have regular terminals.

Q. Do you know whether the Michigan Central runs engines right through to Chicago?

A. I have understood to the contrary, but I have no personal

knowledge of it.

Q. The trains that go through to New York, do you understand that the same engine goes right through?

A. No, sir; not in the time that I have been down there.

Q. As a matter of fact engines are frequently changed on these roads?

A. On all roads to my knowledge.

Q. So that so far as that is concerned, it would be perfectly practicable to change engines as you entered a large city, if there was any necessity for doing it?

A. Some roads have limited the number of miles that they will

allow an engine to run without being put in the house.

Q. Is there any mechanical reason for that?

A. The danger of the engine getting warm in any of its bearings and delaying the train.

Q. It is more apt to wear out if it is kept hot too long?

A. Yes, sir.

Q. Suppose that the common council of this city has, or should pass an ordinance, and it was sustained by the supreme court, that made it necessary to use anthracite coal or coke in this city

upon all locomotives that are operated in the city, would 351 there be any practical difficulty in changing cars at the junction, or changing engines at the junction, and continuing the operation of the road?

Mr. Dickinson: I take the objection that there is no such ordinance in this city, or any other city, requiring the burning of anthracite coal.

Mr. BAKER: It don't express it that way; I don't claim it does, but that it is the legal effect of the ordinance, it makes it necessary to burn anthracite coal or coke.

Q. Would there be any practical difficulty in changing engines when you reached the city line?

A. No, sir; no practical difficulty.

WILLIAM S. MORRIS, sworn in behalf of petitioner.

Examined by Mr. BAKER:

Q. Where do you reside? A. Grand Rapids, Mich.

Q. How long have you lived there?

A. It will be two years the 10th of July.

Q. Where did you formerly reside?

A. Fort Wayne, Ind.

Q. What is your business?

A. I am the superintendent of motive power and rolling stock of the Detroit, Lansing & Northern, the Chicago & West Michigan, and the Saginaw Valley & St. Louis railroads.

Q. That is the Detroit, Lansing & Northern system of railways?
A. The Detroit, Lansing & Northern railway, the Chicago & West Michigan railway, and the Saginaw Valley & St. Louis railway.

Q. Three different companies.A. Yes, sir.

355

Q. All practically under the same management?

A. Yes, sir.

Q. Mr. Heald is general superintendent?

A. General manager.

Q. Those roads run, one from Grand Rapids to Chicago?

A. No, sir; from Grand Rapids to New Buffalo or La Crosse, the Chicago line; we join the Michigan Central at New Buffalo. Q. And then go into Chicago on the Michigan Central?

A. Our cars do; our engines don't.

Q. And the Detroit, Lansing & Northern runs from Detroit to Grand Rapids?

A. Yes, sir.

Q. With a branch up to Ionia and Howard City?

A. Yes, sir.

Q. And where does the other road you named run?

A. From Howard City to Saginaw.

Q. Across the State?

A. Yes, sir.

Q. How long have you had charge of the locomotive department-the motor department of these roads?

A. It will be two years the 10th of July.

Q. And what was your business at Fort Wayne?
A. Master mechanic.

Q. What road? A. The Wabash railway, under General McNulty.

Q. How long were you connected with the Wabash?

A. The last position that I held with the Wabash I was with them almost four years, but I had served in several other capacities on the line.

356 Q. How long have you been a master mechanic, or how long has your experience extended with this particular business?

A. With this business my experience has been about 17 years, but as a master mechanic only about 10 years.

Q. Do you know how to build a locomotive?

A. Yes, sir.

Q. Do you know how to operate one?

A. Yes, sir.

Q. How many years have you been connected with the management of or in connection with railroads?

A. I don't understand your question. How long have I been in the locomotive business?

Q. Yes.

A. Seventeen years.

Q. Your headquarters are at Grand Rapids?

A. Yes, sir.

Q. And all these three roads are operated from that city?

A. Yes, sir.

Q. Will you explain to the jury the devices that are adopted upon the locomotives of that system of railroads for the purpose of avoiding smoke and cinders, as briefly and concisely as you can?

A. We use in the fire-box a brick arch to promote combustion, to retain and burn in the proper place all the gases that it is possi-We use in the front of the engine what is called an ble to do so. extension front, a receptacle, so to speak. Should sparks go through the flues, this receptacle retains the sparks in the front end, and they are carried to a terminal point or any designated point, where the cinders are required to be cleaned from the engine, and they are

dumped, instead of throwing them out of the stack. Q. Will you state the method of construction; how is that

arch built in the back part of the engine?

A. The arch is diagonally located, extends across the extreme width of the fire-box, with an opening at the back end of from four to five inches, as the design of the fire-box requires, and this arch is supported by water tubes for the better circulation of the water in the boiler, and also by lugs or bolts screwed into the side of the fire-box, for the purpose of retaining the arch in its suspended position, in the position required.

Q. How is this receptacle prepared so as to arrest the sparks at

that point, those that get through the flues?

A. A diaphragm or baffling plate is located immediately in front of the front flue sheet; from this baffling plate extends a netting; the exhaust of the engine instead of exhausting below the netting so as to force the sparks at all through the openings, is placed above the netting, and the draft alone is all the force the sparks have to carry them to the front end, and are retained there.

Q. Are these the devices that are used on your road?

A. Yes, sir.

357

Q. Have you made diagrams of them?

A. I have a diagram in my pocket. (Produced it.) There is a section showing the brick arch, and there is a section showing the front end. (Two diagrams.)

Q. We will take this one first. Just explain the diagram to the

jury that I show you.

A. This represents the brick arch, this represents the fire-box the inside of it.

Q. Where is the door to the fire-box?

A. Here.

Q. There is where they shovel in the coal?

A. Yes, sir. These are the grates; this is the ash-pan; 358 those are the dampers on the ash-pan.

Q. That is at the end here?

A. Yes, sir. This is the flue running from the fire-box; they are to the front end of the engine.

Q. You only have one there, but there is a number really. A. Yes, sir; that is just to represent the location; there is the top flue and there the bottom.

Q. But this is all full of flues?

A. Yes, sir, this is full, as full as we can get in there consistently. This is the circulating tubes where the water around the fire-box passes up there in circulation with the fire, and we utilize the heat in the fire-box by placing this surface immediately over the fire; 359

that is within the fire-box; the ash-pan is between the drivers, but lower-the center of the drivers lower than the axle, but not lower than the wheel.

Q. These tubes that run across here of course do not inclose the

passageway around there; how big are they?

A. They are three inches in diameter. Q. So there is an open space left there?

A. Yes, sir.

Q. But the brick arch is solid right across the entire top?

A. Yes, sir, perfectly solid. That represents the section of the center there, as though you sawed it right through; it is a brick wall, you might understand it by that term better; this answers on a stationary engine the same as a combustion chamber.

Q. The smoke goes up here, that space there?

A. The gases do.

Q. What becomes of the smoke?
A. We try not to have any smoke. Q. How far do you succeed in that?

A. Almost perfectly.

Q. (Another diagram is shown witness.) Now show us the front

end of the engine.

A. This is the section right through the center; this is the deflecting plate or diaphragm; it extends over the top row of flues; there are the two flues extended, and it extends over the top row of flues down to about this point.

Q. Is this point adjustable?

A. Yes, sir.
Q. So that you can raise it or lower it to get the proper suction draft?

A. Yes, sir. Q. Whatever smoke and cinders come through the flues, must they stirke these plates?

A. Yes, sir.

Q. Is that a solid plate?

A. Yes, sir. Q. Made of what?

A. Steel & inch in thickness.

Q. When the cinders strike there where do they go?
A. To this point here.

Q. What does that represent?

A. That is the exhaust pipe; that carries the exhaust steam from the cylinders above the netting.

Q. What is that large open space there?

A. That is the receptacle I referred to that carries the sparks that are not consumed in the box.

Q. Where is the netting?

A. Right here, from this point here to this point here; it connects to the baffling plate right across.

360 Q. The exhaust goes right up through? A. Yes, sir; the exhaust is carried through.

3268

Q. It commences at this plate and runs there on a level, then upon an angle to the corner of the box or receptacle?

A. Yes, sir; you can see the position of the netting here.

Q. Have you a piece of that netting with you?

A. I have.

Q. What size is it?

A. It is what is known in mechanical terms as three and a half by three and a half; there is three and a half meshes and three and a half wires to one inch; there is the netting we are using (producing it).

Q. That is 31 by 31?

A. Yes, sir.

Q. So that the way these locomotives are constructed, everything that goes through the smokestack must go through that netting?

A. Yes, sir.

Q. It is a physical impossibility for it to do otherwise?

A. Yes, sir.

Q. To what extent do these devices stop the emission of sparks and cinders from a locomotive?

A. They reduce and prevent the sparks and smoke, when they

are properly fired by the fireman, absolutely.

Q. What do you mean by properly fired; how does the engine have to be fired in order to have that effect?

A. The fireman should understand the principles of combustion, and not overload his engine.

Q. What do you mean by overloading?

A. Putting in too much coal; there should be admitted the proper amount of air to the furnace, so that the gases will unite and form perfect combustion.

Q. Do you produce the best practical results in producing

steam in that way?

A. Yes, sir.

361

Q. But if you put in too much coal it sort of smothers the

A. You cannot produce a perfect combustion if you overload it, you burn a carbonic oxide when you should burn a carbonic acid

A JUROR: You make more sparks with that?

A. No, sir; the sparks are at a minimum; you make more smoke, that is, you burn the earbon into the atmosphere unconsumed.

Q. To what extent have you adopted these devices on your roads?

A. We have them on all of the engines of the lines that I mentioned, with the exception of two.

Q. With the exception of two; where are those two operated? A. One is operated in Grand Rapids yard—that should be 3 in-

A. One is operated in Grand Rapids yard—that should be 3 instead of 2—and the other two are on the Chicago & West Michigan road at different places.

Q. Are these devices in use on all the engines that come to the city of Detroit?

A. They are. 27-55 Q. What effect do these devices have upon the fire risk that is occasioned by locomotives?

A. That is what the devices are placed there for.

Q. Does it reduce the fire risk?

A. It does.

Q. To what extent can a locomotive be operated without the dampers at the base of the fire-box being opened?

A. That depends largely upon circumstances. I have run an engine five miles with the dampers closed, purposely to reduce the steam to the amount of steam I wanted.

Q. That is, you had more steam than you were prepared to

carry?

A. Yes, sir; to prevent the steam from escaping and frightening horses and one thing and another.

Q. Would it be practicable to haul a train say a mile or a mile

and a half at the end of a route with the dampers closed?

A. Yes, sir, it can be done, and practicably, if you see fit to do so.

Q. Is it practicable in starting out from a depot, supposing you start out from a station, and there was dangerous property along the route of the road, would it be practicable to run any considerable distance without opening the fire dampers?

A. If it was necessary to do so.

Q. Do you think that with these devices that are in use it would be necessary?

A. No, sir, I don't.

Q. Your judgment is that the danger is reduced to a minimum?

A. Yes, sir.

Adjourned to Friday, June 19, 1891, 2 p. m.

363

FRIDAY, June 19, 1891-2 p. m.

Cross-examination of WILLIAM S. MORRIS by Judge CHIPMAN:

Q. What is the object of this device, which you have explained to the jury?

A. The perfection of combustion.

Q. That is all, is it?

A. And the arresting of sparks and the reducing to the lowest possible minimum any danger from setting fires.

Q. How long have you had this device on your road?

A. It has been on the D., L. & N. longer than I have been connected with the road.

Q. How long did you say you had been connected with it?

A. Two years the 10th of next month.

Q. You found it there when you went there?

A. Yes, sir.

Q. One of the purposes of this machinery or device is to keep cinders off from the cars and from the platform.

A. Yes, sir.

Q. Does it do that?

A. I think it does.

Q. Thoroughly?

A. To the lowest possible minimum.

Q. I don't care anything about your minimums. Does it do it thoroughly or does it not?

A. I think it does.

Q. You think that your cars are not troubled with cinders?

A. I do.

Q. You think so? A. Not from the stack. Understand me: cars may have cinders on, but I don't think they come from the stack.

Q. Where do they come from?

364 A. I should have to explain that to you. At the points that we dump our eiders at, there is a large accumulation of the same; those cinders that are retained at the front end and dumped at those points, are loaded on flat and gondola cars and taken out and shoveled off by the sectionmen for track ballast. They do not clean the cars very clean, and the cinders, of course, that are left on the cars, dry and blow about on the cars. That is about the only way that I can account for any accumulation of cinders on the cars.

Q. How do the cinders get there originally?

A. They are shoveled on the cars by the men at the pits.

Q. Do the men shovel the cinders on your cars?

A. Yes, sir.

Q. What do they do that for?

- A. To carry them away from the pit out onto the line of the road to use them for ballast.
- Q. But I speak of your passenger coaches and lumber cars and cars of that kind?

A. I didn't understand you to say passenger cars.

Q. Then you don't shovel them onto the passenger cars?

- A. I have no recollection of seeing any cinders on our passenger
- cars. Q. Will you testify to this jury that there are no cinders on the passenger cars since you were connected with the road?

A. I have not seen any.

Q. Have you ever looked for them?

A. Yes, sir.

Q. Never found any?

A. No. sir.

Q. Never seen any on any passenger car on your road?

A. I don't remember seeing any. 365

Q. Do you remember ever seeing any on any lumber cars?

A. No, sir.

Q. Or in lumber yards?

A. No, sir, I don't remember seeing any.

Q. You have been connected with the road two years?

A. Yes, sir.

Q. And never have seen anything of this kind, no cinders in the passenger cars, and no cinders on the lumber or on your lumber cars, or on your cars for lumber, and on other cars, for that matter; A. I have only seen them in the way I have described.

Q. Will you say that there was not?

A. I have not seen any.

Q. Your locomotives drive the trains into the station here, do they not?

A. Yes, sir.
Q. In freight, passengers, and all kinds?
A. What station do you refer to?

Q. The station here at Detroit.

A. I don't think our freight engines come down here; our passenger engines do.

Q. Where do your freight engines stop at?

A. They stop generally out at the Grand Trunk junction.

Q. Out of the city?

A. Yes, sir.

By JUROR: Can you tell us whether there is any fire originates from the sparks from the locomotives, passing through the forests?

A. No, sir, I don't remember of a report of that kind, and 366 I would know if there was anything of the kind. If the jury will permit me, or if it is proper, I will show a diagram.

Mr. Baker. That is something that I omitted. I will call your attention to that. You say in answer to the juryman that you don't remember of a case being reported where a fire was set in a forest, or alongside of the road?

A. Not that was thrown from the locomotives; no, sir. A JUROR: Nor from any spark setting fire to bridges?

A. No, sir.

By JUDGE CHIPMAN: You have known of forests to be on fire alongside of tracks?

A. Yes, sir, recently. Q. How recently?

A. We had some three weeks ago, some very heavy fires on the West Michigan line.

Q. Did you know of any others before? A. Not set from sparks from the locomotive.

Q. I don't ask you that. You have only been in this State a little while?

A. Yes, sir.

Q. How many forest fires have you known alongside of your track?

A. That is the only one I remember.

Q. When you say you don't know of any bridges being on fire along your road?

A. I have known of bridges to be on fire.

By Mr. Dickinson: Did you come down by way of the Detroit, Lansing & Northern here?

A. No, sir, not when I came this time.

Q. You came here? A: Yes, sir.

367 Q. Is there any other locomotive than your locomotive that uses the track between Brighton and Lansing?

A. Yes, sir; I believe the Michigan Central use it.

Q. On your track, on the Detroit, Lansing & Northern?

A. I think not.

Q. It is your own locomotives?

A. Yes, sir.

Q. Have you been advised that some three miles out of Brighton, between Brighton and Lansing, not this side of Brighton, the fencehave been set on fire and burned?

A. I don't remember any such advice.

Q. Do you think if they were burned between Brighton and Lausing, the fence alongside the roadway, do you think it must have been set on fire and not from your locomotive?

A. I think that is possible, yes, sir.

Q. It must have been set on fire; you have such confidence in your device; you have not passed over the road and cannot tell, but I ask from your judgment; your judgment would be that if the fence had burned up, for a hundred feet of fence, you think it must have been set on fire in another way, rather than come from the railroad?

A. I could not say that it was set on fire.

Q. How do you think the fire would be occasioned?

A. I should have to investigate.

Q. How wide is your roadway between Brighton and Lansing? A. I could not say; I don't know but I think about 100 feet.

Q. Is it not 200 feet?

A. I don't know. Q. How much space does your track occupy?

A. Four and a half feet.

Q. Right in the center of your roadway?

A. Yes, sir.

Q. So that if it is 100 feet, taking out the $4\frac{1}{2}$ feet, or $2\frac{1}{4}$ feet, the distance would be about 47½ feet to the fence from the track?

A. About that; that is near enough.

(By a JUROR:)

Q. Will you give us a definition of the word cinders.

cinders mean?

368

A. Cinders, as I apply it, has several meanings. One is an unconsumed carbon, coal that is not burned; another cinder is a mass of foreign matter that won't burn, the carbon is entirely abstracted from it, and not entirely a clear ash, there is sulphur in the cinder, frequently iron, and depends largely upon what fuel you are using and what composes that fuel.

Mr. Dickinson shows the witness a box containing some particles of matter and asks:

Q. In connection with the question of the juror, would you call that cinders?

A. (After examining it.) That is unconsumed carbon.

Q. Would you call it cinders?

A. I should call it unconsumed carbon.

Q. You would not call it cinders?

A. I should call it unconsumed carbon.

Q. Does unconsumed carbon come out of the smokestack?

A. Yes, sir.

Q. Then unconsumed carbon you don't call cinders?

A. In some applications.

Q. Does unconsumed carbon ever come out of the smokestack on fire and fail to burn up?

A. Yes, sir.

Q. Then you call these unconsumed carbon, and not cinders?

No answer.

Q. Where would you say that the stuff such as I show you in this box comes from originally, out of the smokestack?

A. That would; it might.

Q. Well, unconsumed carbon would have to come out of the smokestack, and to do that it would have to come out of the furnace?

A. Yes, sir.

Mr. BAKER: He does not say that is not cinders.

A. I don't wish to be understood so. It had the appearance to me of unconsumed carbon.

By JUROR: How long does this unconsumed carbon enliven coal

before it goes dead out, when it strikes the air?

A. Unconsumed earbon, leaving the stack, passing through the atmosphere, from what I have seen, will probably raise, so that it is perceptible after dark, about 10 to 15 feet; you cannot see it any longer; it is reducing its temperature at about the rate of 180 to 200 degrees, every 'oot of atmosphere it goes through; when this unconsumed carbon, that this matter in the box to me appears to be, it is smaller than the mesh of our netting,—leaves the stack and shows a brightness, it is probably at a temperature of 2,600 or 2,700 Fabr. When it loses its brightness it is at a less degree of heat than it is possible to cause combustion or cause fire with the dryest possible pine that ever was known; it takes 800 degrees Fahr. to unite, to produce the carbon in a dry piece of pine, then it will burn; that is the best I can explain it.

Q. I want to find out how long it keeps alive to ignite.

Mr. Baker: The juryman means, how long it keeps alive

so as to set fire.

A. Traveling a distance of 15 feet, or thereabouts, or between 15 and 20 feet, no matter in what direction, it will be almost or quite, according to the size of the cinder, of course, that has a great deal to do with it, it will be the temperature of the atmosphere or the air about it, not to exceed 15 feet, I think; it may vary some, it will vary according to the size of the cinder, or unconsumed carbon, as you may term it.

Mr. Baker: About how long a time would elapse from the time it got out of the smokestack until it got out, how many moments or

seconds?

A. That would depend largely upon the force of the exhaust; it would be less than a second.

Q. Less than a second?

A. Yes, sir.

Q. What you mean to say is that the small particles of unconsumed carbon or cinders that come out of the stack go out in less than a second?

A. Yes, sir; less than a second.

Q. And in that time they travel about a distance of fifteen feet? A. About that; some that was heavier will go still higher, but you can trace them in the dark by the light; you understand, as long as that light lasts.

Q. So that, by looking at an engine operating in the dark, you

can tell about how long it takes for the cinders to go out?

A. Yes, sir.

Q. You don't mean to say that no unconsumed carbon escapes from your engines; that is, I mean from the smokestack?

A. No, sir.

Q. The object of the netting is to reduce the cinder that goes through to the lowest possible size, so it will not carry a live fire?

A. Yes, sir.

Q. That is what the mesh is for? A. Yes, sir.

Q. Is the unconsumed carbon that they have here small enough to go through your mesh?

Witness takes some particles of matter out of the box and puts them on the mesh.

A. Some of it is, and some of it is not.

JUROR: With the strength of that exhaust, would not that push those little pieces out?

A. The exhaust is above this and not under it.

Q. How can this go through if there is no power to force it through?

A. It is a question of being caused by the vacuum in the stack. Mr. BAKER: Explain how the smoke and the small cinders do

go through the netting; what causes them to go through.

A. The exhaust steam passing through the stack creates what is termed a vacuum; that is, it exhausts the atmospheric pressure with the tubes. That causes the atmospheric pressure which is on the outside, to force its way through the fire to fill this vacuum; it is not a perfect vacuum, you understand; nothing will stand in a perfect vacuum; but it travels with an amount of force that is exerted by causing that vacuum.

JUROR: You have an opening here; here is a netting here, and here is your exhaust from there; it is a kind of draft, it 372

pushes there, it strikes that netting, and when it is too big it remains there, but there is a certain pressure in striking there, and it passes through?

A. Before it strikes this netting, it strikes this steel plate and forces it and breaks it.

Q. But you have your brick wall there?

A. The brick wall is in the fire-box; we are talking about the netting in the front of it.

Q. But your exhaust must connect with it; there is an opening?
A. There is an opening, but the exhaust is in the front end.

Q. But there is a certain amount of pressure that forces those

things through; they will go through?

- A. The only pressure is the draft (pointing to diagram). Here is the exhaust coming here, about the netting, the vacuum is caused by going up in this stack, makes a suction here, exhausts the atmospheric pressure, and all the draft is the draft which would come from the fire-box and from these flues. Now, the greater part of the cinders striking the brick wall, as you stated, in the fire-box, they fall out and burn, but there is a very small percentage indeed.
- Q. Don't you think the pressure of the exhaust would make more pieces pass through that sieve than it would without a pressure?
- A. There is no question about that, if we had no draft; anything larger than the holes the pressure of the exhaust would not be sufficient to drive the cinders through that.

Q. That is the reason, you say?

- A. That is the point; they could not pass through the sieve if they were too large to go through, no matter what pressure there was, the exhaust is not sufficient to drive them through that size.
- Q. A few minutes ago you said that at night you could see the carbon fifteen feet high—see fire fifteen feet high from the smokestack?

A. Small sparks that pass through.

Q. Then there must have been live fire in that spark to see the fire at that distance?

A. Yes, sir.

Q. Supposing the wind would strike that spark, whether it is carbon or whatever it is, there would be more life two feet from the smokestack than at fifteen feet; and you said that at fifteen feet you could see fire?

A. Ten feet, if you please. Q. You said fifteen feet?

A. Yes, sir; we will say ten feet.

Q. There is a heavy wind coming towards the building of Backus, it strikes that fire at two feet, the strength of the wind would make that carbon more inflammable than it would at ten feet?

A. No, sir; it wouldn't.

Q. Didn't you say before that what kills that carbon is the atmosphere?

A. Passing through the atmosphere. Q. But if it does not pass through?

A. It passes through the atmosphere, whether it goes one way or

the other. If it passes through the stack it is in the atmosphere. It is not necessary to go up. It is in the atmosphere, and it absorbs the temperature of the atmosphere, the same as you take a red-hot piece of iron; you can put it into a quart of water, and it will heat the water to a temperature of less than the iron, and you pass it into another cold quart, and you soon reduce the temperature of the iron. The other is just the same, only more rapid.

Q. You take a piece of red-hot coal and it will burn you?
A. But at the same time, if any other man picks it up

after you have hold of it, it is not quite so hot.

Q. He will get burned just the same, though?

No answer.

Redirect examination by Mr. BAKER:

Q. Is not this the fact, that after unconsumed carbon comes out of the smokestack, it will cool at about 15 feet, whether it goes up or down or sideways?

A. It does not make any difference where it goes; it is nature's

law.

Q. It is the temperature of the air that cools it?

A. Yes, sir.

Q. And when it is outside there the temperature is the same?

A. Yes, sir.

Q. That is, it goes along with the air?

A. In any direction, so long as it is in the atmosphere.

Q. And those cinders are very light particles?

A. Yes, sir.

Q. And easily float in the air?

A. Yes, sir.

Q. But, of course, the laws of specific gravity take them to the ground sooner or later?

A. Yes, sir.

Q. Does your road, or either one of your roads, run in the immediate vicinity of planing mills and saw-mills at Muskegon, or at any other point?

A. Particularly so at Muskegon.

Q. How close to planing mills and saw-mills does the main line

of your road run in Muskegon?

A. All the way from ten feet, and in some places they are closer to the track than that. I have some diagrams here that will just show what we are running through in Muskegon every day.

Q. Does this diagram represent a section of your road (showing

diagram)?

A. Yes, sir; this represents the main line and sidings in Muskegon, from Water street to what is called our lower depot, at Western avenue.

Q. Will you point out your depot there, this end here?

A. That is the lower depot, at Western avenue.

Q. What is this building here, a platform for loading lumber onto the cars?

A. Yes, sir.

Q. What is the next one to the right?
A. That is a saw-mill of Torrance & Co., a large saw-mill.

Q. Where they saw pine lumber?
A. Yes, sir.
Q. With all the surroundings of a mill?

A. Yes, sir.

Q. How far from your road?

A. Twenty-seven feet from the main line of the road. Q. The corner of the mill is within 27 feet?

Q. What is the next building to the east, or further up the road? A. The Ryerson Manufacturing Co.

Q. What do they manufacture?

A. Dressed timber.

Q. What do you mean by that, that they dress square timber?

A. They finish and prepare the timber for market, the 376 boards, and in fact all; it is a planing mill and saw-mill and everything combined.

Q. A sort of finishing mill?

A. Yes, sir.

Q. How close is that mill to the track?

A. Fourteen feet.

Q. How many stories is that mill?

A. Two stories, I think; I won't be positive about that.

Q. Is it brick or wood?

A. Wood frame.

Q. What are the next buildings on the curve?
A. This is the Muskegon Milling Co.

Q. What do they do?

A. Saw-mill.

Q. How close to that mill does your main track run?

A. About 25 feet; 17 feet from the side track.

Q. What is the next mill, or next piece of property?

A. That is a lime depot.

Q. These mills that you have testified in regard to have been in operation there since you have been connected with this road?

A. Yes, sir, and are there today.

Q. Have you a map of any other portion of Muskegon?
A. Yes, sir, here is a map. (Witness produces another may.
This is the line between Water street and Western avenue. This is the main line indicated there, marked "Main line."

Q. What is this largest building here?

A. A planing mill.

Q. Where they dress lumber?

A. Yes, sir.

Q. Whose is it? 377

A. I don't remember.

Q. Is it a large mill?

That is 100 feet to the inch. The mill is about 150 A. Yes, sir.

feet.

Q. How close does that run to your main track? A. About 15 feet; seven feet from the side track. Q. What is on the opposite side of the main line?

A. A dry kiln, 25 feet from the main line.

Q. What is the building further to the left? A. A shed; 29 feet from the track.

Q. What is that building further to the right?

A. Another shed.

Q. How far is that from the side track?

A. Twelve feet.

Q. How far from the main line?

A. About 27 or 28 feet.

Q. What is this circular thing to indicate here?

A. A pile of sawdust and shavings, that is frequently piled there. Q. That is refuse from the mills that is piled there?

A. Yes, sir.

Q. Is it burned there or carted away?

A. I could not say.

Q. But it is piled there as it comes from the mill?

A. Yes, sir.

Q. What is this large mill towards Cedar street? A. A large planing mill.

Q. What is this small building at the corner here?

A. A shed in connection with it.

Q. How close is that exposure to the main line?

A. About forty feet. Q. And how far from these side tracks? 378 A. It is eight feet and five inches.

Q. From the first side track?

A. Yes, sir.

Q. What is the next building to the right?

A. The Standard Oil Co.

- Q. What kind of oil do they handle? A. They handle kerosene mostly, coal oil.

Q. Is that a storehouse?

A. Yes, sir, for barrels and oil and everything else; that Standard Oil place is 20 feet from the main line.

Q. What is the building further to the right?

A. A shingle mill; that is 27 feet from the main line.

Q. Your road has been operated adjacent to all this property since you have been there?

A. Yes, sir.

Q. How many times have you set fire to these buildings since you

have been there?

A. We have never set fire to them that I know of. We have eighteen passenger trains and eight freight trains; all but four of the passenger trains pass most, in fact all of those buildings, every

Q. That is, the buildings on both maps?

A. Yes, sir. In addition to that we have five switch-engines operating continually days as the business requires. Sometimes it is three and sometimes five at night, operating through those mills, in those side tracks, and all about Muskegon, in addition to the regular trains that run in there.

Q. Muskegon is a large lumber country?

A. Yes, sir. Q. It is a place where a great deal of lumber is manufact-379 ured?

A. Yes, sir.

Q. And your railroads there run around to the different mills?

A. Yes, sir.

Q. And also the Grand Rapids & Indiana?

A. Yes, sir.

Q. And furnish side-track facilities to them?

A. Yes, sir.
Q. The side tracks are simply spurs from the main line?
A. Yes, sir.
Q. They had a big fire up there in Muskegon the other day?

A. Yes, sir.

Q. Did the railroad set that afire?

A. No, sir.

Q. Did the railroad ever set any fire there?

A. I don't remember of it ever setting a fire in Muskegon. If the jury would like they can look through our time table, and see the trains that are on the table there in Muskegon, in addition to the five regular switch-engines. There are eighteen passenger trains that arrive on the lines and eight freight trains, without extras, that are run.

Q. But in a place like Muskegon, is it necessary to do a large

amount of yard-work?

A. Yes, sir.

Q. How many switch-engines have you?

A. Five.

Q. And they are working backward and forward among these mills and planing mills and manufacturing institutions?

A. Continually, that is, during working hours.

380 Q. You have never heard of them setting fire to anything? A. No, sir.

Recross-examination by Judge Chipman:

Q. What railroads run through Muskegon?

A. The Chicago & West Michigan, and the Toledo, Saginaw & Muskegon railway.

Q. Three? A. Two.

Q. There is your own? A. Yes, sir, the Chicago & West Michigan. Q. And the Detroit, Lansing & Northern?

- A. No, sir, not there; you are on the other side of the fence now.
- Q. This West Michigan road that you are connected with has the same device?

A. Yes, sir.

Q. What sort of a device have they on the other road that runs through there?

A. I don't know.

Q. Don't you know anything about that?

A. No. sir.

Q. I would like to know what made you take so long in answering Mr. Baker's question as to how far this unconsumed carbon, as you call it, would go before it expired?

A. I was trying to figure in my mind the number of feet that the spark of uncensumed carbon would have to travel before it would

be at the temperature or below the temperature of igniting.

Q. Now, I ask you what made you take so long to do it, if you knew all about it; you put your hand to your brow and waited a long time.

A. It was simply a mathematical question.

381 Q. What are the elements of your mathematical calculation in that case?

A. I take them from a French scientist, whose-

Q. Never mind where you take them from. I ask what they are; never mind about the authority, come right to the point?

A. That a spark travelling through the atmosphere will reduce

its temperature at about 180 to 200 degrees Fahrenheit.

Q. I saw you took great pains to say that it made no difference in which direction it went?

A. It does not, according to my experience.

Q. Now then, does the velocity with which it comes from the pipe make any difference?

A. I think not.

Q. Does the temperature make any difference?

A. Certainly.

Q. Does the state of the atmosphere as to wind make any difference, the speed, the violence of the wind?

A. It would have a tendency to cool it all the faster.

Q. Does it make any difference as to the space that it travels; that is the question we are after?

A. The force would make some difference.

Q. Then there is no certain rule by which you can determine how far it will go?

A. Except from what observation I have made myself.

Q. One of the jurors asked about this mesh that you have here; where is it?

Witness produces it.

Q. You sifted some of this stuff lightly through the mesh. When the cinders come in contact with this, is there not some force accompanying it?

382 A. Very little.

Q. There is some?

A. Some.

- Q. What keeps this from getting clogged? A. They frequently do become clogged.
- Q. What is the effect then? A. The effect is no draft. Q. No draft whatever?

A. No, sir; according to how much of the opening is closed, to what extent the opening is closed.

Q. This part might be closed, and that open, and it might be

closed in spots?

A. Yes, sir. Q. Then there is force enough there to fasten cinders in, or unconsumed carbon, as you choose to call it, so that at times you have to clean them out?

A. We are not troubled so much from the cinders.

Q. I am not asking you that; answer that question directly.

A. I am trying to.

Q. No, you are not. I say both ways, cinders or unconsumed carbon; answer it my way. Let me repeat the question: Sometimes these get clogged up so that you have to use force or a power of some kind, the hands of a man, or a rake or something in order to get them out and unclog it, is not that so?

A. I tried to answer that question, but you didn't wait until I

did.

Q. You were not trying to; you commenced giving us your theories, and I want this jury to understand this testimony, and I don't think they are understanding a word of it. Now, do you

have to use force sometimes in order to clean this netting out?

383 A. I don't remember ever using force to clean it.

Q. Do you have to use a man's hands to clean it; how do you clean it?

A. You asked if they become clogged; stopped sometimes.

Q. And you said they did.

A. Yes, when we are firing up our locomotives; that is where the difficulty arises generally, in the round-house. The sap or pitch in the pine we fire with, frequently clogs those things.

Q. How do you clean them out?

A. We burn it out; that is one way of cleaning it.

Q. Any other way?

A. And taking the netting out and putting in a new one, if it is necessary, to save it.

Q. Any other way?

A. That is the way we would apply it; those are the quickest ways we know.

Q. Any other way you ever do it?

A. No, sir.

By JUROR: Would it not be a practical way to turn on more steam, to give more force, to do that?

A. No, sir, there wouldn't be force enough to clean it.

O. Is there not force in that combustion that you create, caused by the steam coming in contact with the hot air?

A. No, sir.

Q. Is not that coming from the reserve steam you get from the temperature of your boiler?

A. What do you mean?

Q. Where do you get that? A. That is not sufficient.

- Q. You use that for depositing those cinders there; where 384 do you get your draft?
 - A. I don't understand you. Q. You don't want to, then. A. I don't understand you.

By Judge Chipman: You appear to be a scientific gentleman.

A. I don't pretend to be so.

Q. I judged so from your conversation. What do you call a piece of charcoal?

A. Carbon.

Q. If a piece of charcoal is on fire and floating through the air, it is carbon still; there may be some of it ashes, but it is carbon until it is all burned up?

A. No, sir, it is a combination. Q. A combination of what? A. Of oxygen and carbon.

Q. But the carbon itself remains carbon until the oxygen consumes it?

A. The oxygen doesn't consume it.

Q. What does consume it; the oxygen does consume it, does it not?

A. The combustion consumes it. Q. What makes the combustion?

A. The uniting of the oxygen with the carbon under fixed temperature.

Q. Then that part which is not united with the oxygen and consumed remains carbon until the end?

A. Yes, sir.

Q. This stuff that you call carbon here probably belonged to greater lumps originally?

A. Possibly so.

Q. Then that is unconsumed carbon, according to your 385 story. You have often seen plates or pieces of charcoal, things of that kind, floating in the air, have you not?

A. I don't remember seeing them.

Q. You say that there have been no fires along your railroad, no mills burnt down, no lumber yards burnt down?

A. There has been mills burnt down on the road. Q. Where?

A. At Muskegon.

Q. When? A. There was one burnt last winter.

Q. What mill was that?

A. I don't remember the name.

Q. What kind of a mill was it?

A. A saw-mill.

Q. A pine mill, I suppose? A. Yes, sir.

Q. Do you know of any other mills being burnt down there along the line of your road?

A. No, sir.

Q. On the line of your Chicago & West Michigan; do you know of other mills being burnt there along the line of that road?

A. No, sir.

Q. Do you know of any other property besides mills being burnt?

A. I don't remember of any.

Q. Was there a fire in Muskegon the other day?

A. Yes, sir.

386

Q. How big a fire was it?

A. I could not say how big it was. Q. A pretty big fire was it not?

A. Yes, sir; a very large fire.

Q. It started in a lumber yard, didn't it?

A. I don't know where it started.

Mr. Dickinson: It burnt over an area of about a quarter of the town of Muskegon?

A. Yes, sir.

Judge Chipman: It burnt about a quarter of the town, and it started in a lumber yard, the papers say?

A. I don't know.

Q. Have you heard that it started from a locomotive?

A. No, sir.

Q. You have heard all else about the fire except that?

A. I have not heard that.

Mr. BAKER: No one else heard it either.

Judge CHIPMAN: We will put you on the stand to testify to that. I did hear that.

Q. This fire in Muskegon the other day started, as you understand it, in a lumber yard?

A. I don't know where it started. I should know it if it started

from a locomotive.

Mr. Dickinson: From one of yours, but you would not know it unless it started from your road, if it started from another road?

A. I might hear it.

Q. But you don't live at Muskegon?

A. No, sir; at Grand Rapids.

Q. (Showing diagram.) Did you prepare this?

A. No, sir.
Q. What is the scale of this?

A. 100 feet to the inch.

Q. How far is your railroad depot in which your freight and passenger trains run, from the furthest of these mills?

387 A. We have two depots there in Muskegon. Q. A depot and a freight-house?

A. Yes, sir.

Q. How far are these mills, the list you gave to Mr. Baker, from your passenger depot?

A. Some of them are two or three squares in between the two

depots, a great many of them.

Q. Only about two or three squares; about how much to a square?

A. About 300 feet, one or two or three hundred feet; they range

from one or two or three hundred feet from the depot.

Q. (Showing another diagram.) Do you know how much this small map is scaled?

A. One hundred feet to the inch.

Mr. Dickinson asks that the two diagrams just shown witness shall be marked, and they are marked Morris Exhibits 1 and 2 respectively.

Q. The switch-engines that you have spoken of served the purposes of all sorts of manufactures to load?

A. Yes, sir.

Q. Did you ever in your life hear of a fire originating from a switch-engine attending to the business of manufacturers on any railroad?

A. I don't think they have.

Q. They have them to use about their business in every sort of business that ships goods?

A. It is for shifting the cars from one point to another.

Q. Does your road run from your depot to these business places you have named, at grade?

A. Yes, sir.

Q. It is all grade?

A. Yes, sir.

'388 Redirect examination by Mr. Baker:

Q. The mills along there are on the same grade?

A. Yes, sir.

Q. That is the road is even, or substantially even with the first floor of the mill?

A. Yes, sir.

Q. And the mills are usually more than one story?

A. Usually; yes, sir.

Q. So that there are cases of a railroad running right along in front of mill property, manufacturing property?

A. Yes, sir.

Q. About how high are your smokestacks from the ground?

A. Our maximum height is about 15 feet.

Q. And the first story of an ordinary mill is about 10 or 12 feet?

A. As much as that, I should judge. Q. You use bituminous coal there?

A. Yes, sir.

Q. Was that fire in Muskegon anywhere near a railroad?

A. I didn't go over the burnt district; I don't know how close it

Q. Did any of your depots or side tracks or anything like that burn?

A. No. sir.

Q. You don't know the exact location of the fire, or its dimensions?

A. No, sir; I have not had time to look that over.

Q. You have not heard in any way that it was occasioned by any of your roads, or that any one claimed so?

389 A. No. sir.

Mr. Baker states that he will have the diagrams of the engine also marked, and they are marked Morris Exhibits 3 and 4, respectively.

Joshua B. Barnes, sworn in behalf of the petitioner.

Examined by Mr. BAKER:

Q. Where do you live?

A. Springfield, Ill.

Q. How long have you lived there?

A. Six years.

Q. Where did you reside before going to Springfield?

A. Fort Wayne, Ind.

Q. How long did you live there? A. Twenty years.

Q. What is your business?

A. At present superintendent of the motive power of the Wabash road.

Q. How long have you held that position?

A. Six years.

Q. What was your business prior to that?

A. Master mechanic at Fort Wayne for the same company.

Q. How long were you master mechanic?
A. Between four and five years.

Q. What was your business before that? A. I was general foreman in the shops.

Q. Of the locomotive works?

A. Yes, sir.

Q. How long were you foreman?

390 A. About 12 years.

Q. What did you do before that?

A. I worked in the shop; in different shops throughout the country, in the United States. Q. How many years' experience have you had in working in

shops?

A. Twenty-five or 30 years.

Q. All the time in the shops where they manufactured locomotives?

A. Not all the time. I was out of doors some of the time, traveling on the road.

Q. You are a machinist?

A. Yes, sir.

Q. Do you know how to manufacture and operate a locomotive?

A. Yes, sir; I have done that work.

Q. And you now have charge of the motor or locomotive department of the entire Wabash road?

A. Yes, sir.

Q. About how many miles of road has that company?

A. In the neighborhood of 2,000 miles.

Q. Where does the road extend from; give us the most easterly and western termini?

A. Kansas City, Toledo and Detroit, St. Louis and Chicago.

Q. How far west does it go?

A. Kansas City.

Q. And has a line into Chicago?

A. Yes, sir.

Q. About 2,000 miles of it.

A. About that.

Q. It goes to St. Louis?

A. Yes, sir.

391 Q. You have had charge of this motor department for the last six years. Have you had any experience in any of these cities to which your road runs relative to the suppressing of smoke and cinders?

A. We have had some complaints, more or less, from several of them.

Q. Have you given any attention to that subject for the last four or five years?

A. Yes, sir. Q. Will you state what devices have been used upon your road for the purpose of suppressing cinders?

A. We have an extension front in, perforating sheet, straight stack, circulating tubes, supporting brick arch, for that purpose.

Q. All one combination?

A. Yes, sir.

Q. There are a number of devices?

A. There are numerous kinds of them that are used for that purpose.

Q. Have you improved or perfected it recently?

A. The majority of the railroads for the past four or five years have been doing everything that they could to perfect that, in order to prevent smoke and cinders, and some of them have succeeded very well in it.

Q. Your road you say runs into Chicago?

A. Yes, sir.

Q. Do you know whether they have an ordinance there against smoke and cinders?

A. I believe they have.

Q. Did your road get into any difficulty on account of it?

A. We have been complained of sometimes, as a great many others. A year ago they made several complaints.

392 Q. Did they impose any fines?

A. I think they did.

Q. So that your attention was particularly called to the subject?

A. The attention of my master mechanic at Springfield was called to it. It is a matter of local attention, with which the master mechanic of each district has to do, and he went before the jury and showed them the device he was using, and I think they had \$850 fine, but they released it when they found what we were doing to prevent it.

Q. Did you make a practical demonstration there as to what could

be done with the smoke and cinders?

A. Yes, sir.

Q. Now will you go on, using the diagrams or maps if you have them, and explain these devices and how they operate on an engine?

Witness produces diagrams and exhibits them to the jury.

A. In the first place, this is a three-inch tube, that is placed through the water leg of the boiler.

Q. So it connects with the water?

A. It connects with the water. It is connected onto the inner leg; here there are two sheets four inches apart running round the entire fire-box; the tube is fastened into the sheet here the same as the tube is fastened in the boiler, allowing the water to circulate through that tube, answering for two purposes, circulating the water through the tube and supporting the firebrick arch; those brick are 30 inches square, and three in number, carried far enough there so as not to allow the sparks to pass through too easily and go through the

flues, and consume as many of them as possible, as those brick are very hot; if those become very hot they melt and run together to a certain extent and them.

run together to a certain extent, and they are so hot that when the sparks are drawn up, good many of them are consumed; that passes through there and draws the gases or unconsumed carbon or coal and everything through there that will not consume there, striking a deflecting plate, it runs down through the flue sheet further below there, with a sliding plate that can be lowered still further if necessary, a deflecting plate; after they leave that deflecting plate they pass along under there and come in contact with a perforated sheet of steel that is fast to a baffling plate, and runs across the entire length of the front end, filling it perfectly tight, as represented in this sheet there (pointing to diagram).

Q. Covering the entire space?

A. Yes, sir; and then they are drawn up against that and beat against that until they are small enough to go through it, and by that time pretty near all the fire is out of them; then they go up through that, striking another baffling plate that reaches up to this point, up to the roof or base here. That is a conductor that conducts them to the stack. Then they go through this throat and this stack, which is contracted there so as to increase the velocity of the

spark or einder or unconsumed carbon; then it is released again; this tends to release the friction, and it passes out of there very rapidly, and when they reach the top of the stack there is very little or no fire, when all conditions are right, but there are conditions when it is not right, from wear or negligence, when they will throw more fire than others. Those engines, every time they make a journey over the road (100 to 175 miles is a district), those engines are inspected by an inspector, and if there is anything wrong with

them when they come in, the engineer reports it.

394 By Juron: You call this a brick wall?

A. That is fire brick, three inches, thirty inches square; that is a brick arch.

Q. Do you mean to say that is made there just to keep the cinders

from coming out?

A. It is to deflect the cinders back to the boiler there; to burn them, so as not to let them pass up in the flues immediately; to keep them traveling in the fire-box longer.

Q. Is not that brick wall to keep the flames from going into the flues, and to keep the flames to strike the boiler, in order to heat

your boiler—is that the principal object of that brick wall?

A. If we should carry that there further back still, and continue its course back there until we only have four or five inches there, we would burn a hole through that crown sheet, and there is where the destruction would come in, and we cannot keep it for that purpose; if we did, we would burn a hole through that crown sheet.

Q. And if you had no brick wall, what would be the conse-

quence?

A. It would burn up and go right in the flues. The heating of your fire is done in the side of the boiler; the principal amount of the steam is generated from the sides of the sheets, where the fire is right against the side, and through the engine front it strikes the crown sheet. We try to prevent that, because the mud lies there sometimes, and it is very injurious, and if it were too hot there it would injure it—what we call pocketing. We have to guard that with this brick arch as much as possible.

Q. That is to arrest the flames?

A. It is to keep the flames from traveling that way.
Q. Does it have any effect on the cinders?
A. It consumes mere than half the cinders.

Q. You consume more than half of them right there?

A. By the fire-box; and it increases the steam according to the capacity of the engine, by retaining and burning those cinders in

there.
Q. If the brick was not there it would go through the flues?

A. Naturally so.

Q. That increases the heat there?

A. Yes, sir.

Q. So that practically it would aid you both ways?

A. Yes, sir; that is the intention.

By ANOTHER JUROR: Are there any locomotives built without that brick arch?

A. Plenty of them; and then another thing: In passing that flame back that way and admitting here through that little tube. you see a plate on the rear end of that boiler; the air and the flame passing there passes over and ignites together and burns two-thirds of the smoke right there.

Q. Do you mean to say that all boilers elsewhere have no brick

wall?

396

A. It is a necessity for that purpose. This is what we call the improvement on the consumption of cinders and smoke.

Mr. Baker: This operates to some extent like the chimney of a

kerosene lamp?

A. Yes, sir, you get combustion there.

Q. And about 50 per cent., you say, is consumed right there?

A. Yes, sir.

Q. And the other 50 per cent. passes through the flues?

A. Yes, sir, and then strikes this netting there.
Q. You say that that is a perforated plate?
A. Yes, sir.

Q. Have you got pieces of that there; you use perforated plate of

wire netting; what size is in use on your engine?

A. It depends upon the class of coal largely, and where we are running, and on the class of engine and the steaming qualities, and so on.

Q. What is the ordinary size? Do you use more or less of all those different classes?

A. Yes, sir; those are the standard sizes.

Q. What is the smallest?

A. Sixth inch wide by 3, and 1 by 3; it depends on the class of coal you want to use.

Q. Do you use anthracite coal on your road?

A. No, sir; bituminous coal.

Q. Is there a different grade of that?
A. Yes, sir, several of them. We have some coal in Indiana that is very light, blows away very easily.

Q. Do you use a finer mesh for that coal?

A. Yes, sir, wherever the necessity requires you, as nearly perfect as we can.

Q. This diagram at the right of this map represents the perforated plate?

A. Yes, sir, showing a plan of it.

Q. What is that round hole?

A. That is where the exhaust comes through and that is where the steam pipe comes through.

Q. Otherwise that is all open there?

A. It is all solid.

Q. Except the perforations which are open?

A. Yes, sir, subject to the exhaust. Q. And you extend that right through straight across 397 there?

A. Yes, sir, 36 inches.

Q. Do your cinders collect down in the corner?

A. Yes, sir.

Q. And you drop them out?

A. Yes, sir, into a hot conder bucket.
Q. You also put on a conductor plate?

A. Yes, sir, that is a solid plate, not perforated to allow any suction there, so that they can be retained here and baffled and the fire extinguished as much as possible, and then they are passed out.

Q. This baffling plate that extends down here is solid?

A. Solid steel plate unperforated.

Q. You have an adjustable slide at the bottom of that, to raise

and lower it?

A. Yes, sir, according to the steam she is drawing; we adjust it so that it may take a long time there, take a longer time to baffle them.

Q. Who invented this, or where did it come from?

A. This is the Barnes patent. Mr. Dickinson: That is yours?

A. Yes, sir. The Southern Pacific, the Northern Pacific, are using it, they use the attachment that goes with it, that has been lately gotten out and improved upon, also mine, which is in operation at the depot here in Detroit, subject to the inspection of yourself and the jury, or any one else that want to look at it, and I would be pleased to show you what it will do any time that you will designate; and we have got it in operation there right along in and out on the Wabash switch-engine, that is located there

permanently to do the switching, at the passenger depot and around the boats, that is engine 35, which can be seen there every day, and can be tested by experts as to its suppressing

smoke and cinders.

Mr. Baker: Will you describe this additional device?

A. There is a valve placed on the top of the boiler head inside of the cab, which is operated by the fireman and engineer; it requires no skilled labor to operate it; anybody can open and close it without any difficulty. The steam is passed down there into the pipe right around the boiler to the root or base of the stack; at the same time there is a pipe connected in with that one, of smaller dimensions, one three-quarters and the other one-quarter; the three-quarter pipe is connected with the fire-door of the boiler; that is represented right there; that is a cast-iron plate with seven 2-inch tubes passing right through the boiler to the fire, and in those seven 2-inch tubes there are nipples placed in them, one-sixteenth of an inch opening, and connecting with an inch core, running through this cast-iron pipe; if it is furnished with steam on the outside there are 24 three-eighths run direct through the easting, and connect with that nipple; as soon as the steam is turned on that forms an ejector and forces the steam into the fire, and at the same time this is operated and forms a cone of steam, this drawing over here to allow access here, making a combustion from one end of the boiler to the root of the stack perfect.

Q. Do you retain the exhaust in the smokestack?

A. Just the same.

Q. And you have an additional discharge of steam there?

A. We make no changes whatever from the original engine; but only add this.

399 Q. What is the practical effect of these devices?

A. This has been in operation about a month. We have seven on in Chicago, which they have accepted as all right.

Q. Who accepted them?
A. Under the smoke ordinance up there; they accepted them finally, and they are all right, and we are putting them on as fast When I was asked to come here last week by Mr. Joy, I made my master mechanic at Fort Wayne have one equipped with all the latest improvement-, for your benefit, for you gentlemen to look at.

Q. To what extent can you suppress smoke and cinders with this

device?

A. Seven-eighths, about that.

Q. To what extent can you reduce the fire risk from an engine?

A. Almost absolutely.

Q. The fire risk is reduced to almost nothing?

A. Almost nothing; I would not say perfectly, because there is

nothing perfect.

Q. In operating an engine, you say in order to do this work as well as it can be, it is necessary that the conditions should be per-What are the conditions that would throw the devices out of their proper working capacity?

A. Sometimes it lays with the engineer and fireman.

Q. What sort of negligence on their part or want of skill would affect it?

A. They overload the engine with coal, and then they destroy

the combustion; that is in regard to smoke.

Q. That is, you could put in too much coal and it would have substantially the same effect as burning a kerosene lamp too high?

A. Just the same effect, exactly.

400 Q. So that the coal should be properly fed to the engine? A. Necessarily so.

Q. When does an engineer usually overload it, when they want

to leave their engine a few moments?

A. Not exactly that; but they are very fond of the cushion on the seat of the box, some of the firemen, they get up there and rest.

Q. They have to get up and make a movement?
A. Yes, sir, to come down off their box.
Q. But if an engine is properly equipped and properly operated, would there be any nuisance or any damage that could come from one of them?

A. Not ordinarily; no, sir.

Q. Do you think that you have succeeded in reducing this to as low a minimum as can be reached?

A. That I could not say. There might be others that would

have better success than I have had with it after a time, but I have done my best, and think, so far, that is the best there is now, or as good.

Q. Have you adopted this on the engines that are operating in

Chicago?

A. Yes, sir.

Q. How many do you have there?

A. We have nine switch-engines and one suburban engine and eight passenger engines that come there into the union depot.

Q. Is that the Dearborn Street depot? A. Yes, sir.

Q. All on the Wabash?

A. Yes, sir, that is, it is on the Western & Indiana line; we don't run in there; that is the road that takes all the roads in.

401 Q. The Western & Indiana owns the right of way; it is a union depot company?

A. Yes, sir.Q. Do your engines go into the depot?

A. Yes, sir. Q. They go in with this device?

A. Those that we have this on; we haven't had time yet to put it on all.

Q. Has the Western & Indiana adopted it? A. No, sir.

Q. Has any other company adopted it?

A. No, sir, not there; they have some of them got on the Hutchinson burner.

Q. Is that like this?

A. I have never seen it. Q. Do you know whether the Hutchinson burner was accepted by the Chicago authorities?

A. I think it was.

Q. You know yours was?

A. Yes, sir.

Q. They have recently passed in this city an ordinance prohibiting the emission of dense smoke or cinders by locomotives; will there be any practical difficulty in your complying with such an ordinance, so far as the Wabash road is concerned?

A. I don't know to what extent we would have to comply with I have got an engine down here that is equipped, and if it was thoroughly inspected, I think it would answer. I could make all

the rest of them just like that.

Q. Could you show us that engine this afternoon?

A. Any time you wish to see it, and in practical operation. 402 I will show you the niceties of it all over; the inside of the fire-box and the way it is fired, and the operation of it, and why it burns the smoke, and how it arrests the sparks.

Q. Do you know whether it is at Delray or at the slip?

A. It is at the depot now awaiting your pleasure. Mr. BAKER: I would like very much to have the jury and counsel go down and let the witness operate the engine and explain it.

WITNESS: I should be glad to have you go down and see it. have spent a great deal of money and a great deal of time the last 3 or 4 years, and we have worked very hard with it, and we feel very gratified that we have accomplished so much in that direction. I can leave these cards or diagrams with you for future reference; I will leave them right here.

Mr. BAKER: We would like the jury to go and see that, and have

you there to show the engine.

A. We will show the engine pulling cars and any use whatever you wish to put it to; we will put a coach behind the engine and run the engine on the track, and we will leave the windows and doors open, or any way you want it.

Mr. Dickinson: The jury may do whatever they see fit.

WITNESS: The engine has been assigned there and has been working.

Mr. Dickinson: This device is a simple one?

A. Yes, sir.

Q. Any engineer can work it?

A. Any child can work it that is big enough to open the valve.

Q. It is not necessary for you to be there?

A. No, sir; any engineer can work it.

A JUROR: I would like to go there at night.

403 WITNESS: It is about as near perfect as anything I ever

Mr. Baker: It is for the jury to decide whether they will go. Juror Charest: Mr. Greiner cannot go and I cannot go.

Mr. Dickinson: I think the suggestion that you see it some evening after dark is a good one.

WITNESS: I will put it at your disposal any time you say so, and

anywhere you like.

Mr. BAKER: Mr. Lesher, will you see what the jury determine to The jury may retire and consult if they wish.

The jury then retire to consult as to the matter of going to see

the engine with the device upon it.

During the absence of the jury Mr. Dickinson says:

Mr. Dickinson: The showing of a device which is not in general use, and which is practically so new a device as to be an experiment, and not in general use and operation on the railroads, we think is incompetent, and we take an exception to the investigation of it by the jury.

Mr. Baker: It is not in general use, but it is in use. He has got beyond that which is invention; it would be in use, under his testimony, on the question of complying with the ordinance.

After being out about five minutes, the jury returned, and the

foreman says:

Mr. Lesher, the foreman: The jury has decided to go down some evening next week; they prefer to hear the evidence today, and will fix a time next week when it will suit their convenience to go.

Some of them may not be able to go. We cannot fix day and date yet, but will do so next week. And they would 404 like to have a train to it to see what it will do, and run out

to Delray or some place.

Mr. Baker: That is satisfactory. We will take you out to Del-

ray or out somewhere.

Mr. Dickinson: We would like to have you give us notice when you want it done, on the afternoon of the day you determine to have it done.

The examination of the witness is then continued as follows by Mr. Baker:

(). How many engines have you put this completed device upon, upon your road?

A. We have possibly got now 10 or 12 with it completed.

Q. How many are in operation in Chicago?

A. Four, I think, switch-engines.

Q. Four switch-engines?

A. Yes, sir.

Mr. Dickinson: How many trunk lines are there that enter Chicago with this last device?

A. Only one.

Mr. Baker: Does that engine do all the hauling?

A. I will say that the Rock Island & Pacific, I think, has this device; they adopted it a year ago; they must have in the neighborhood of 300 engines.

Mr. DICKINSON: Have they it on all? A. No, sir, not all, but a great many.

Q. Which device?

A. The first, not the last. All except the additional steam pipe. Mr. BAKER: You have it on about five that operate in Chicago? A. About that number.

Q. Four switch-engines and one that carries passengers?

405 A. Yes, sir, it is a suburban engine. Q. Do your engines on the main line go into the depot in Chicago?

A. Yes, sir.

Q. You have not adopted it on those engines?

A. We are putting it on some of them.

Q. As rapidly as you can, I suppose?

A. Yes, sir.

Q. Recently, since your attention was called to this case, you sent

this engine to Detroit?

A. The attachment was put on the engine at Detroit; the engine has been working here all the time since she left the shop, probably six months or a year ago.

Q. In its present shape?

A. Yes, sir, they have just added this attachment to it.

Q. This additional attachment?

A. Yes, sir.
Q. That is the only thing in the device that is quite recent? A. That is the only change in that from the original device.

Q. Before you put this attachment on the engine was it here before you; you put it on since you have been here this time? A. No, sir, three or four days previous to my coming.

Q. Before putting the last device on, did it have your first device that you have shown?

A. The engine was doing well and giving good satisfaction.

Q. But you have two devices? A. She had the original one.

Mr. Baker: She has had that on for some time?

406 A. Yes, sir. Q. How long?

A. Probably a year ago it was put on; the other switch-engines running here have got diamond stacks on; they are different and not so good.

Q. How many engines has the Wabash system altogether?

A. In the neighborhood of 400.

Q. It will take some little time to put it on them all?

A. Quite a while.

Q. Are all those engines operated in populous cities?

A. Yes, sir.

Q. They all go through populous towns?
A. Yes, sir.

Q. How often do you change engines on your lines?

A. For what purpose?

Q. Take the run from here to St. Louis, do your engines go right through to St. Louis?

A. No, sir.

Q. How many times do you change?

A. The average run for the engines on the Wabash system, as it is on a great many other roads, is from 100 to 175 miles, as the stations or terminal points may be convenient to do that.

Q. Then you have two engines that run between here and Chi-

cago?

A. Yes, sir, two engines, one runs from here to Lexington June-

tion and the other from there to Chicago.

Q. So that it is a common thing in operating a railroad to change engines?

A. Yes, sir.

Q. You do that usually in 100 or 175 miles?

A. From 100 to 175 miles, just as it may be convenient to do so for round houses and terminal points; of course it would not hardly be advisable to make an actual mileage stop-out on the prairie.

Q. You do it according to the convenience of the station?

A. Yes, sir, convenient terminal points.

Cross-examination by Judge Cripman:

Q. You say that this device is your patent? A. My patent, the first one, not the last one.

Q. How long ago did you patent the first one? A. I think that was patented in 1877 or 1878.

Q. Fourteen years ago?

A. The last patent was in 1887, I think.

Q. But you commenced on it in 1877?

A. Yes, sir.

Q. And have been at it ever since?

A. I was at it before that. We have all been at it, all railroad men have been looking after that.

Q. It is a matter of general concern?

A. Yes, sir; every one has been at that for the last 20 years.

Q. How many patents are there for smoke-consumers?

A. There might be 5,000 for all I know. Q. Do you know anything about it?

A. I have never examined the Patent Office on that.

O. You know there are a great many, though?

A. I should think there might be 5,000; I give a guess at it, because I have not examined the Patent Office.

Q. But you have knowledge enough to know there are a great

many?

A. Yes, sir; it is important enough.

Q. How many locomotives have you on the Wabash system?

408 A. Four hundred or nearly that.

Q. How many have your device attached to them?

A. I presume probably in the neighborhood of 300.

Q. In actual use?

A. Yes, sir.

Q. How many coming into the city of Detroit have they?

A. Do you mean passenger, freight or switch?

Q. I don't care what kind.

A. That depends on the business we have here. Sometimes there may be 8 or 10, sometimes 5.

Q. I don't think you understand me. How many engines with

your device come into the city of Detroit?

A. That depends largely upon the business coming here. Our business may require 10 of them, and half of those might have my device on.

Q. All of them have not your device on?

A. Not all.

Q. You speak of using more than one locomotive on a trip, say from Detroit to Chicago; is that determined by divisions?

A. Yes, sir.

Q. One locomotive runs over one division of their road?

A. Usually, yes, sir, unless the other engine is broken down or something, and through necessity it goes along.

Q. But that is the general rule?

A. That is the general practice.
Q. And another locomotive runs over the other division to the terminus at the end of the line?

A. Yes, sir.

Q. When a locomotive takes a train out at this place you spoke of a minute ago, and you change locomotives, does that locomotive go on into Chicago?

409 A. At Lexington Junction?

Q. Wherever it is.

A. Yes, sir; that goes right into the union depot.

Q. What depot do you say your trains go into Chicago in?

A. Into the Polk Street depot. Q. What company owns that?

A. A great many companies own it, I think. Q. Is your company one of the owners of it?

A. I don't know what interest they have in there.

Q. It was built and in operation before you went into Chicago? A. No, sir, it has been built since they ran in there; I think it has been built within the last seven or eight years.

Q. What track do you run on?

A. Over the Western & Indiana, I believe. Q. That is the track of another railroad?

A. I think so.

Mr. Joy: It is the track of the union depot company, for your information.

Q. How many different roads use that track?

A. I could not tell you. There is a great many roads coming in and out over those tracks there, and I don't know how many roads there are using it.

Q. You say there is a great variety of these patents?
A. There is a great variety of patents.

Q. There is a great variety in actual use?

A. Yes, sir.

Q. Is your device used on the Detroit, Lansing & Northern?

A. No, sir; but similar to it, so nearly like it that it was only the least change in the combination to avoid the patent. 410

Q. Why don't you sue them for an infringement? A. I cannot; I have not money enough to fight them.

Q. It is the money, but you have no doubt they are infringing your patent?

A. I have no doubt of it at all; the Pennsylvania road is using it

too.

Q. You have perfect confidence in your patent, have you not?

A. I have so much confidence in it that I am not afraid for you to go down on that engine and see how it works.

The witness says he will leave the cards or diagrams, being No. 181, and plate No. 189.

Mr. Baker and Mr. Dickinson say the cards may be considered in evidence.

HENRY C. SIMPSON, sworn in behalf of petitioner.

Examined by Mr. BAKER:

Q. Where do you live? A. Saginaw, east side.

Q. How long have you lived there?

A. About 21 years.

Q. What is your business?

A. Locomotive engineer. Q. How long have you been a locomotive engineer?

A. About 21 years.

Q. What road do you work on? A. The Flint & Pere Marquette.

Q. How long have you worked on that road?

A. Twenty-one years. Q. In what capacity?

A. Locomotive engineer.

Q. Do you work on what is known as their belt line? 411 A. No, sir; I run on the Bay City division of the F. & P. M.

Q. Does the section of the road on which you run, run through lumber yards and planing mills and such sort of property up there?

A. It runs by one planing mill and by two lumber yards before you get to the yard where they do the switching.

Q. Whereabouts-in East Sag aw?

A. In Bay City.

Q. How close to the planing al do you go?

A. I should judge it was between 18 and 20 feet; I never measured it exactly, but I think about that distance.

Q. That is, the side of your engine comes within 18 or 20 feet of the building?

A. Yes, sir.

Q. Did you ever go round on the belt line?

A. No, sir.

Q. You have never operated there?

A. No, sir.

Q. How near do you go to a lumber pile?

A. So near that I could lean out of the cab window and touch them; that is, in the yard I go through; about three times.

Q. Is your yard on the river?

A. It is close to the river, at Bay City.

Q. Is there any part of your road where the ballast is covered with shavings and sawdust?

A. There is a portion of the road where there is an accumulation from the planing mill, where the track is covered with an accumulation of that from a saw-mill, as high up as the top of the rail.

Q. How often have you been there?

412 A. I have run continuously there for two or three months, on the regular run there, but I have been there about twelve or fifteen years.

Q. Mr. Hatswell is the master mechanic of your road?

A. Yes, sir.

Q. And you operate the engines that are constructed and planned by him?

A. Yes, sir.

Q. To what extent does the operation of the engines that you work upon, through property of the kind you have described, injure that property as to loss by fire?

A. Well, I could not say as to that. I can say that we have never set any fire there, and never been troubled in that way.

Q. Not for 21 years?
A. Not for 18 years that I have been going through there.

Q. How far is it practical to operate a locomotive without open-

ing the dampers?

- A. Well, you have your water up at a good stage, have plenty of water so that you will not have to put on your ejector, have steam all right, and you can run a mile or a mile and a half from the start.
- Q. Suppose you were coming into a station, suppose you were at West Detroit, how far could you come into the station with your dampers closed, supposing you were afterwards going into the roundhouse?

A. You could not run much further than that. You could run a mile and a half.

Q. You could run a mile and a half this way?

A. Yes, sir.

413 Q. Could you increase the draft or maintain heat in your fire-box and flues by opening the door through which you feed the coal?

A. You cannot increase the draft to be of any benefit to the fires; you would simply keep the smoke from trailing from the stack. What I mean is, if you had more draft through the fire-box it would have a tendency to do that.

Q. That is, you could increase the draft, but it would not increase

the fire?

A. It would not benefit the fire.

Q. In running over this sawdust formation, and close to a planing mill, do you have your dampers open in such places as that?

A. Yes, sir.
Q. That is the way you operate up there?

A. Yes, sir.

Q. Is it necessary in running, the way your engines are constructed, to close the dampers in such a place?

A. We run, I know, with the dampers open, and pull big trains.

out of there with the dampers open.

Q. And you have not known a fire occasioned by it in your experience?

A. I have not.

Q. That is a lumber country up there at Saginaw?

A. Yes, sir.

Cross examination by Mr. Dickinson:

Q. Near your yard there is one planing mill, I think you said? A. There is two that we pass.

Q. You pass two within what distance?

414 A. I guess they are about a mile and a half apart, I should judge.

Q. Are they both about the same distance from your track?

A. Yes, sir.

Q. Fifteen or twenty feet?

Q. You were examined on the first trial of this case before?

A. I was in the case of the Union Mills Company.

Q. You think both the planing mills are 15 or 20 feet?

A. I should judge they would be about that. The first one is not much more than that.

Q. Whose are they?

A. I don't know.

Q. Have you been running by them for 18 or 21 years?

A. No, sir; I have been running by them steady for about three The first one has not been built only four or five years. months.

Q. And you have been running by there for about three months?

A. Yes, sir, steady run.

Q. You have done business for those mills, switching?

A. I don't run switching. There are three engines doing switching.

Q. But in connection with your road they do all the switching? A. Yes, sir; there is tracks branch off the main track; the tracks are made to clear the mills with the cars.

Q. I want to know whether the switches run between your main

track and the mill?

A. Yes, sir; the side track is between the side track and 415 the mill.

Q. Have you ever seen the Backus property?

A. I don't think I did. I may have seen it, but never to examine it closely. Q. Have you ever been in those planing mills in Bay City?

A. Yes, sir. Q. What kind or part of the business is done in the ends of the mill toward the track?

A. They have piled there dry lumber and box shooks, sash,

and so on.

Q. It is a storage place?

A. They are piled there outside the building.

Q. What is the outside of the building next to the track, on the side of the building?

A. Windows and doors.

Q. Opening on your track?

A. Yes, sir.

Q. You have been in both mills?

A. Yes, sir.

Q. How many times? A. I could not say. Q. Several times?

A. Several times.

Q. But you don't know who owns them or runs them?

A. No, sir; I have never made any inquiries, and I don't know.

Q. You run a passenger train?

Yes, sir; that is, I run a passenger train, and two of my runs are freight, a freight each way.

31 - 55

Q. How many cars do you run in your passenger train down there?

416 A. Five is the longest train and two the shortest.

Q. Let me understand you. You run a passenger train, and do you run freight trains also?

A. Yes, sir.

Q. As engineer?

A. Yes, sir, on the branch run, two trains that I handle each day are freight.

Q. Do you connect them with your passenger cars?

A. No, sir.

Q. You have to change engines?

A. No, sir, I use the same engine that I use for the passenger service. The track is comparatively level and I can pull a pretty good train.

Q. In running by the lumber yard, how near is that to the

track?

A. There is one lumber yard, I should judge, would be about the same distance as the planing mill, 18 or 20 feet; there is a side track to the lumber yard.

Q. Whose lumber yard is it?

A. I don't know.

Q. You have been in the lumber yard? A. No, sir.

Q. What kind of lumber do they pile next to the track?

A. Rough pine lumber.

Q. Is there a mill connected with that lumber yard?

A. I think there is a planing mill in there, but it is quite a ways from the track.

Q. How near is that to your railroad yard?

A. The lumber yard?

Q. Yes. A. The upper yard runs right by it, right into that lumber vard. 417

Q. And you never close your dampers in passing either

one of these places?

A. No, sir; that is, when we have surplus steam, working along slow, I close the damper and open the door to keep the pressure down, to keep her from popping.

Q. But you don't do that in order to pass these places, the plan-

ing mills and lumber yard?

A. No, sir.

Q. That is not the object of it?

A. No, sir.

Q. Whereabouts do you shut your dampers so as to try the experiment of how long you can run without opening?

A. When she has surplus steam we run along the road-Q. You never do it unless you have surplus steam?

A. Yes, there is places we have to do it.

Q. What do you do it for?

A. To keep the steam down, and to comply with the city ordi-

Q. Are these lumber yards and planing mills that you speak of

in Bay City?

A. Yes, sir. Q. And the city ordinance requires you to close your dampers?

A. It requires us not to make a noise, and to throw as little smoke

as possible.

Q. I asked you a moment ago to tell me how and when you tried the experiment to see how far you could run with the dampers closed, and you said that you tried that because of the city ordinance, in addition to your other reason that you did it when you had surplus Now you say in running by these planing mills you don't steam.

close your damper for the purpose of running by?

A. Not for the purpose of running by. 418 Q. But whether you close them for the purpose of running by or not, do you close them when you go by there?

A. Occasionally we do.

Q. It is not your practice?

A. No, sir.

Q. Where do you close your dampers as a matter of practice?

A. Coming up through the street in Bay City.

Q. Does the ordinance require you to close the dampers running in the street?

A. Yes, sir.

Q. Does it require you to close them within the city limits of Bay

A. I don't think it does, except on this street, from the depot to

Eleventh street.

Q. Do you testify that the ordinance requires you to close your dampers when you pass through that street?

A. I think it does.

Q. And that it does not require you to close your dampers in running within the city limits?

A. If it does I don't know it.

Q. How long a distance is the street? A. I think half to three-quarters of a mile.

Q. That is all level grade?

A. Going south is a little upgrade.

Q. How much?

A. I could not tell you that.

Q. There is not much grade in Bay City?

A. No, sir, it is nearly level.

Q. Is there any other grade in your line that you have been on for 18 or 21 years?

A. I have not been on that run for 18 or 21 years. Q. On any run you have been on?

A. Yes, sir.

419

Q. Whereabouts?

A. From Wayne to Saginaw there is quite a heavy grade.

Q. Did you ever run up that grade with your dampers closed?

A. No, sir.

Q. Did you ever run up any grade in your life, what may be called a steep grade, with your dampers closed?

A. Not any distance at all.

Q. What is the utmost you ever did it?

A. That would be a hard matter to determine. Q. You don't remember any instance, do you?A. No, sir.

Q. Suppose you had, not a switch-engine, but a locomotive engine. and you were driving up a train of say 500 feet long, the total train was 500 feet, how many cars do you say you had?

A. Five in the passenger trains.

Q. How many freight cars do you pull?

A. Forty.

Q. Did you ever pull forty cars and run with your dampers closed, even on a grade?

A. I have by those planing mills.

Q. Loaded?

A. Not all loaded.

Q. How many were loaded?

A. I could not tell you.

Q. About how long is a forty-car freight train? A. I could not tell you that; I never measured it.

420 Mr. Baker: Over 1,200 feet.

Q. How did you come to close your dampers with forty cars in

running by the planing mill?

A. We stopped half a mile or so from that planing mill, and in loading freight there is a surplus of steam accumulates, and we run by there.

Q. The reason is because you stop, and from the steam accumu-

lating?

A. Yes, sir.

Q. Because you have more steam than you want?

A. Yes, sir.

Q. And you don't close your dampers because you run by the planing mill?

A. No, sir; it was because we had surplus steam.

Q. You would stop about how long to get an accumulation?

A. Sometimes 15 or 20 minutes.

Q. With forty cars, partly loaded and partly unloaded, part light, on a level track, have you ever run with forty cars, without having a stop to accumulate steam, with your dampers closed?

A. Yes, sir. Q. Where?

A. On the Bay City division.

- Q. This same line?
 A. Yes, sir.
 Q. What was the occasion or object of keeping the dampers
 - A. To keep her from blowing off the surplus steam.

Q. That was when you had an overplus of steam?

A. Yes, sir.

Q. Do you testify that you could run up a grade of fifty-two and a half feet to the mile with such a train, without opening 421 your dampers, and without getting a surplus of steam?

A. You could not run up without opening the dampers; we would

have to open the dampers to get up there.

Q. I think you would, there is no doubt about it. And what is the effect of opening the dampers?

A. To give her more draft to burn your fire.

Q. If you had a load, you, in going up that kind of grade, would open up your dampers?

A. Yes, sir.

Q. Do you know of an engineer on earth who would not in practice?

A. I don't know that I do, if he wanted to go up the hill.

CLINTON B. CONGER, sworn in behalf of petitioner. Examined by Mr. BAKER:

Q. Where do you live? A. Grand Rapids.

Q. How long have you lived there?

A. Since March 1.

Q. Where did you live before that?

A. Port Huron.

Q. How long did you live in Port Huron?

A. I lived there from 1870 to 1880, and from 1882 to until March 1, 1891.

Q. What is your business? A. Locomotive engineer.

Q. How long have you been a locomotive engineer? A. Since July, 1870.

Q. What roads have you worked on as a locomotive engineer? A. I worked on the road that had several different names, but it is now the Chicago & Grand Trunk, from October, 422 1870, to October, 1887.

Q. Where does that road run?

A. From Port Huron to Chicago. It was the Port Huron & Lake Michigan when I commenced to work with it; the name was then changed to the Chicago & Lake Huron, and then to the Northwestern & Grand Trunk, and then to the Chicago & Grand Trunk, but it was the same line all this time that I was on it.

Q. What road are you now working on?

A. The Chicago & West Michigan, and the Detroit, Lansing & Northern, and the Saginaw Valley & St. Louis.

Q. That is the system of railroad that is managed by Mr. Heald, of which Mr. Morris is the master mechanic?

A. Yes, sir.

Q. Where do you run?

A. I am not running a locomotive at present. I am what you

call traveling engineer. I look after the consumption of coal and the use of oil, and the way the locomotives are handled by the men when out on the line.

Q. And at the different yards?

A. Yes, sir; switch-engines and main-line engines alike.

Q. Are you familiar with the locations of the lines of these railroads in Muskegon?

A. Yes, sir; pretty well familiar.
Q. And in Grand Rapids?
A. Not all the points that they run to. Q. Is Muskegon a lumbering town?

A. It is.

Q. And a saw-mill town?

A. Yes, sir.
Q. Are there any planing mills there?
A. Yes, sir. 423

Q. To what extent do the engines on this system of roads on which you are engaged now endanger loss by fire to the adjoining property?

A. I cannot see that there is any danger.

Q. Was this big Muskegon fire that occurred a few weeks ago

occasioned by any of your engines?

A. No, sir; I don't understand that it was. I was taken up to the point, as a matter of curiosity, and shown where the fire was started, how it started. All the buildings between there and the railroad are still intact.

Q. It didn't commence near the railroad?

A. No, sir; quite a way back from the railroad—the second or third street. I was shown the place by some citizens, and also by one of the railroad employés.

Q. So that when Judge Chipman heard it was started by the rail-

roads, he was mistaken?

A. I could not say that.

Judge CHIPMAN: I did not say it was started by this railroad.

Q. You have seen the place where it started?

A. I was shown where the blacksmith shop and livery stable stood, in which it started.

Q. How much was it burned up?

A. I didn't go over all of it. There is a wide strip on Pine street, right through the town, away from the railroad. I never heard it stated that it was set fire to by any locomotive.

Q. Did it indicate, from the location, that the railroad started it? A. No, sir; the same shavings and pieces of shingles are

424 lying there now that lay there before the fire. The road runs through part of that.

Q. How far is it practicable to operate a locomotive with the

dampers closed?

A. If the dampers are perfectly air tight, probably half a mile on a heavy grade and two miles on a level, if the engine is working light. It depends altogether on how hard the engine is working.

Foreman LESHER: Some of the jury would like to know the dis-

tance of where the fire started from the railroad?

A. The railroad runs this side of the West Western avenue, right against the mills, between there and the street, I should think West Western avenue is about 100 feet, and then there is a row of buildings and another street back of that, and down 10 or 15 below the level of that street, which has been graded up, is where the fire started.

Judge Chipman: Is there another railroad near there?

A. No, sir.

Foreman LESHER: Could it be possible, in going around, for

sparks to escape and go around there and set it afire?

A. No, sir; I would not be afraid to put powder out on the street, so far as sparks are concerned. A man pointed out to me the point where it was understood the fire started, in the blacksmith shop.

Mr. BAKER: Inside?

A. Yes, sir; I think it was inside. The blacksmith shop burnt first and the wind carried it, I understand, to a livery stable, which next burned, and the wind blowing in that direction carried the fire to all those little wooden buildings, as well as to the very fine wooden buildings.

Judge Chipman: Did you try the experiment of putting powder

there and trying to blow yourself up?

A. No, sir; but so far as the sparks from the locomotive are concerned, I think the powder would be perfectly safe.

JUROR: Did you ever know of any sparks igniting from a loco-

JUROR. Did you ever know or any spark

motive?

A. I cannot say about that. My experience with a locomotive has been principally through a clear country, but not since we commenced burning coal have I known of fire starting by a locomotive.

Q. During your whole connection with the Grand Trunk did you

cross any forests at all?

A. Yes, sir.

Q. Didn't you have any forest fires during the whole time you were with them?

A. I don't remember of any.

Q. What was that great fire about 10 years ago through the State of Michigan; was not that caused by a locomotive?

A. I don't know whether that fire was before the narrow gauge went up to the Thumb or not.

Q. I mean the fire in the Thumb.

A. I don't understand that was caused by a locomotive.

Mr. BAKER: There was no railroad there.

A JUROR: I think the narrow gauge was there at that time.

A. I don't understand that caught from a locomotive.

Another Juror: During the fall of the year don't you often find spots of grass burning on the side of the track?

A. Lit by locomotives?

Q. Yes. A. No, sir.

Q. I have seen spots of grass along the track on fire; I have noticed it, and I wanted to ask whether it was done by locomotives?

426 A. The men set fire to it.

Judge Chipman: What do you mean by men setting fire

to it?

A. The sectionmen burn up the ties along the track, and they burn also the grass as soon as it gets dry enough, burn it out as far as the fence. I have known it to be burned as high as three times in one season, as often as it gets dry.

Judge Chipman: We have no cross-examination.

James A. Robertson, sworn in behalf of petitioner.

Examined by Mr. BAKER:

Q. Where do you live?

A. Grand Rapids.

Q. How long have you lived there?

A. About five years.

Q. Where did you live before that?

A. Ionia.

Q. How long did you live in Ionia?

A. I lived there over eight years; not permanently located there, though, for more than that.

Q. What is your business? A. Locomotive engineer.

Q. How long have you been a locomotive engineer?

A. Nearly 14 years.
Q. What roads have you worked on?
A. The Detroit, Lansing & Northern.

Q. Is that the only road you have worked on?

A. As a locomotive engineer.

Q. You have been there about 14 years?

A. I have worked there since the road was constructed east of Lansing.

427 Q. Or west of Lansing?

A. No, sir; the road was constructed from Lansing to Greenville when I went to work for the company.

Q. Is Greenville a lumber town?

A. Yes, sir, it used to be, and it is quite so yet.

Q. Is Ionia a lumber town?

A. Not so much.

Q. Grand Rapids? A. Yes, sir; quite a good deal.

Q. A good deal of manufacturing in Grand Rapids?

A. Yes, sir.

Q. Have you run into Muskegon?

A. Not much.

Q. Have you run to Big Rapids? A. A little there, not much.

Q. Is that a lumber town?

A. Yes, sir.

Q. How close have you run with your locomotives to a planing

mill or a saw-mill?

A. Oh, in yards where there is switching to be done, with freight trains and so on, we have went onto tracks where there is piles near; we have went right over the mill to the piles.

Q. But take the main line of the Detroit, Lansing & Northern, does it run close to any saw-mills, or planing mills, or lumber yard?

A. It runs close, but I cannot say how close.

Q. Forty or fifty feet away; that is from such properties on the road that adjoin the right of way; are there such properties?

A. I think there is; I am not familiar with anything except between Grand Rapids at present, as far as that is concerned. There are no planing mills within 40 or 50 feet of the tracks; 428 there is lumber yards but no mills that I know of there.

Q. Do you remember, there is a planing mill in Lansing right across from the depot?

A. But that is more than 40 feet, about that anyway; 50 feet I

should say.

Q. As a locomotive engineer, will you tell the jury to what extent the locomotives on your road injure the adjoining property from loss by fire?

A. I don't think it injures it.

Q. That is based upon your experience along the line of your road?

A. Yes, sir.

Q. How far is it practicable to operate an engine with the dampers

A. On a level track you could run with your dampers closed for a mile, I should say.

Q. Suppose you were going up quite a steep grade, how far could you go with your dampers closed? .

A. I should say we could go about half a mile.

Q. You could not go so far, of course? A. No, sir.

429

Judge Chipman: We have no questions.

Francis Adams, sworn in behalf of petitioner.

Examined by Mr. Baker:

Q. How long have you lived in Detroit?

A. About 34 years consecutively.

Q. You must be an old settler? A. I am so, old-settled at last.

Q. How old are you?

A. In a few days I shall be 60. Q. What has been your business since you have lived in Detroit?

A. My chief business has been a lumberman, manufacturing lumber, and buying and selling lumber.

32 - 55

Q. Pid you ever have a saw-mill in Detroit?

A. I had three.

Q. Where were they located?

A. One was located at the front of Tenth street, on the Michigan Central track, and the two others on the east and west side of Thirteenth street, if continued to the river.

Q. Where the old union depot grounds now are?

A. Yes, sir; it forms part of them.

Q. Where do you reside?

A. At the corner of Fifth and Lafayette avenue.

Q. How long have you resided there?

A. 24 years.

Q. Have you had any experience in real estate in Detroit?

A. Some. I have bought some and sold some.

Q. Have you had any knowledge of the value of real estate in the vicinity of Mr. Backus' planing mill and box factory?

A. At different times, both sides of it.

Q. Your saw-mills were mills at which pine lumber was sawn?

A. Yes, sir.

Q. And one of them was located this side of the Michigan Central crossing?

A. Yes, sir.

Q. How long ago was that?

430 A. I think we vacated that in 1863.

Q. Did you go down to the other location at that time?

A. I had occupied that for a year or two then. We occupied

both locations at one time.

Q. How long after that did you have a saw-mill near the foot of Thirteenth street?

A. We had one prior to our vacating at Tenth street.

Q. But how long a time did it continue?

A. We continued that as a saw-mill until 1873.

Q. What was it used for?

A. A planing mill for some time.

Q. Was that known as the Brooks & Adams mill?

A. It was.

Q. From your knowledge of the value of property in that vicinity, and considering the location of Mr. Backus' planing-mill property there, what, in your judgment, would be the value of the River Street front of that property, running halfway back say, what would be the market value, in your judgment, of the land itself, if it was vacant?

A. About \$100 a foot.

Q. You think that would be a fair market price for it?

A. I think it would be a good price for it.
Q. What do you base that opinion on?

A. On the purposes that it could be used for, and the large amount of corresponding land that is for sale in this city at much less prices.

A JUROR: What is the depth of that?

Mr. Baker: I think the depth is about 150 to 200 feet, halfway back.

O. What would the Fort Street front be worth? A. Very nearly the same; I should say a little less.

Cross-examination by Mr. Dickinson: 431

Q. In the various businesses you have been engaged in have you not omitted something in the list; have you not been engaged in depot-building to some extent?

A. I have to some extent; at the same time I didn't leave the

lumber business to go into it.

Q. Did you have any planing mill like Backus'?

A. Somewhat similar.

Q. What did you make in your planing mill?

A. What we used to call straight lumber, no cut work.

Q. You had no wainscoting?

A. Yes, sir, lots of it.

Q. Did you do any hard-wood lumber business?

A. Very little.

Q. Did you do the variety of work that Backus does?

A. No, sir.

Q. What varieties did you do? A. What we call straight work.

Q. How many years ago? A. I think it is about 12 years.

Q. You mean by straight work, plain lumber, and work in long lumber?

A. Yes, sir.

Q. And made into boxes?

A. Merchantable lumber, stripped. Q. You have made moldings? A. Yes, sir.

Q. But that is straight work?

A. Yes, sir; no cut work.

Q. Did you ever go through Backus' mill?

A. Not through the new one, except to look in there.

Q. Do you know anything about it?

A. Very little. 432

Q. Do your know whether comparatively it is one of the finest in the West?

A. I have no doubt about it.

Q. It is one of the best in the United States, from what you know of planing mills?

A. It is not one of the largest.

Q. But it is one of the best; how much lumber does he use a vear?

A. He has told me he uses up over 30,000,000.

Q. How much do the largest you speak of use, in the United States?

A. I was in one in Chicago, and they claimed they used over 60,000,000.

Q. Where is there any other one that uses over 30,000,000 in this country?

A. I think you will find one in Albany.

Q. Which one is that?

A. I cannot give you the name.

Q. But the Backus mill is a very fine mill?

A. Yes, sir; and does very good work.

Q. Do you think the situation is pretty good there, with his track facilities with the Michigan Central?

A. Very fair.

Q. It is a nice place for his business?

A. It would not be for me; it is not a place that would suit me for that kind of business.

Q. It is pretty well situated with reference to the rest of his plant, his lumber yard and his storage-house?

A. He thinks so, but I don't think so.

Q. You think he could move out of that place without any material damage, do you?

A. It would cost him the expense of moving. I do not think otherwise he would be very much damaged.

Q. And it would not affect his relations with his storage-house and lumber yard?

A. I don't think so.

Q. You think that fine machinery could be utilized by moving t?

A. After being moved; yes, sir.

Q. And could be refitted?

A. Yes, sir.

Q. Have you been in the mill?

A. No, sir.

Q. You know that the mill is adjusted to the machinery and the machinery to the building?

A. I presume so.

Q. The old mill that you had down there the old Detroit union depot took, didn't they?

A. No, sir, they took the ground.

Q. I mean the ground. You took off the mill?

A. Yes, sir.

Q. What did you do with the mill?

A. Sold it?

Q. What did you get for that planing mill?

A. I forget.

Q. You had a fine equipped planing mill?

A. No, sir; pretty well worn out.

Q. And a saw-mill connected with it?

A. Yes, sir; it was pretty well worn out.

O. What did you get for the planing miles.

Q. What did you get for the planing mill?

A. I think I sold the pit for in the neighborhood of \$2,000.

Q. What did you get from the Detroit union depot for the 434 real estate?

A. In the neighborhood of \$200 a foot.

Q. Where was that situated?

A. In two pieces; a part of it comprising lots 1 and 2, in the west part of the Lafferty farm, and a part on the Godfroy farm.

Q. But where as to streets?

A. Between Fifteenth-and-a-half and Twelfth.

Q. Below Backus' principal property?

A. Below Backus' planing mill and this side of his river property.

Mr. Baker: It was river-front property?

A. Yes, sir.

Mr. Dickinson: How much front on River street did you have?

A. Nearly 500 feet.

Q. Running back to the river?

A. To the channel bank of the river, varying from 450 to 475 and 600 feet in depth.

Q. After that you acted for the union depot companies sometimes,

didn't you?

A. In a limited capacity for a short time.

Q. You have in all the contests that the union depot Co. had in condemning property for the depot itself, you have been a witness for the depot company on real-estate values?

A. I don't think all; several of them, however.

Q. A good many?

A. Yes, sir, a good many.

Q. Did you ever know a jury to agree with you on the value?

A. I never paid much attention to it. 435

- Q. Did you ever know a jury to give less than three times your estimate on a piece of property; give a single instance?
 - A. I have not burdened my memory with all those things. Q. You don't think much of the property down there, do you?

A. Yes, sir, I call \$100 a foot a good price for it.

Q. Did you have any switch connected with your planing mill?

A. No, sir.

Q. You never had any facilities from the Michigan Central at your planing mill?

A. No, sir; at the Tenth street I had.

Q. I mean the planing mill that you sold; did you do all your shipping by rail by carting to the railroad?

A. Yes, sir. Q. All of it?

A. Yes, sir.

Q. No facilities for running a car and loading on?

A. No, sir.

- Q. No connection with the Michigan Central or any other railroad?
 - A. No, sir.

Redirect examination by Mr. BAKER:

Q. As I understood you, you indicated that you didn't think Mr. Backus' property was very valuable property, situated as it is, for the purposes for which it is used; I understood that you so stated?

A. No, sir; I thought it was good property.

Q. But he has his lumber yard at the foot of Eighteenth-436 and-a-half street?

A. Yes, sir.

Q. So that he has to haul every particle of his lumber up to the planing mill?

A. Yes, sir.
Q. Do you think that is a good location?

A. That is what I said was not; I said that he appeared to be well pleased with it; I should not be; I should have located on his other property in better shape to suit myself.

Q. You think that is an item of unnecessary expense?

A. I do.

Q. The teaming that he has to do?

A. I do. I think there are more convenient places on the Michigan Central, very near him too.

JUROR: Do you own any stock in the new union depot company? A. I don't, nor in any other railroad company.

Recross-examination by Mr. Dickinson:

Q. You think that according to your judgment you could locate Backus' business better?

A. It would suit me better.

Q. Backus has carried on that business since before 1870, has he not?

A. Somewhere about that time, that he was there; on the opposite side of the street, however, I think.

Q. He carried it through the panic of 1873?A. I don't think he did.

Q. He did business through 1873, didn't he?

A. Well, yes, some, and some he didn't.

Q. You are not very friendly with Mr. Backus, are you? A. I was not at that time.

Q. He made a success of this business?

A. No. sir.

437

Q. He has not?

A. He has since that time, but not up to that time, he hadn't.

Q. He has made a success, accumulated the lumber yard in the course of his struggle, his lumber yard and his planing mill?

A. He has got them together, but his pecuniary condition I don't know. I knew what it was then.

Mr. BAKER: You did know his condition then?

A. I did.

Q. And his business at that time had not been a success?

A. I didn't think it had, from some things I saw.

Mr. Dickinson: He made it a success before he left it, didn't he?

THE FORT STREET UNION DEPOT CO.

A. I don't know. I don't know what it has been since. By outside appearances it is a success.

Q. What is your reason for feeling ill towards him; does he owe

you money?

A. No, sir.

Q. Is it a money matter?

A. Do you wish to press that question? I didn't have any personal trouble with him, but if you press the question I will tell you, but I would rather you would not press the question. It is no money of mine.

Adjourned to Monday, June 22, 1891, 2 p. m.

438

June 22, 1891-2 p. m.

J. B. MULLIKEN, sworn for petitioner.

Examined by Mr. BAKER:

Q. Where do you live?

A, Detroit.

Q. What is your business?

A. I am a member of the board of public works.

Q. What was your former business?

A. Railroading.

Q. What roads were you connected with?

A. The Detroit, Lansing & Northern and Chicago & West Mich-

Q. How long were you connected with the Detroit, Lansing & Northern?

A. Sixteen years.

Q. What was your position on that road?
A. General manager.

Q. Have you held any other railroad positions? A. Yes, sir, nearly all the positions in railroading.

Q. From general manager down?

A. Yes, sir.

Q. So that you are familiar with the railroad business?

A. I think so.

Q. Were you connected with the D., L. & N. when the Fort Street union depot enterprise was first started?

A. Yes, sir.

Q. And had been for some fifteen or sixteen years?

A. Yes, sir.

Q. That company has done business, has it not, since its organization, at the Michigan Central depot?

A. Yes, sir.

Q. Have no quarters of its own in this city?

A. No.

439

Q. Will you state whether there are any practical difficulties in that company or that road doing business at the Michigan Central depot?

A. Nothing that is absolutely impracticable.

Q. As far as operating the trains is concerned, they have been operated there?

A. Yes, sir.

Q. But with reference to the business of the company that competes with the Michigan Central, are there any difficulties?

A. Yes, sir.

Q. What were those difficulties, the general nature of them?
A. The Michigan Central and the D., L. & ... had a contract made some 17 or 18 years ago, which prevented the Lausing road from competing with the Michigan Central.

Q. In what respect?

A. In respect to transporting freight and passengers between points where the Michtgan Central road was already constructed to.

Q. Did your road originally run to Grand Rapids?

A. No, sir.

Q. But within two or three years a branch has been constructed from Grand Ledge to Grand Rapids?

A. Three years ago.

- Q. So that you have a direct route from Detroit to Grand Rapids? A. Yes, sir.
- 440 Q. Has the Michigan Central a line that goes to Grand Rapids?

A. Yes, sir.

Q. It also has a line that goes to Lansing?

Q. Your road runs through Lansing?

A. Yes, sir.

Q. What was the nature of this contract; did it prevent you from

doing business at Lansing or Grand Rapids?

A. It prevented our going to any points not reached at the time the contract was made. It did not prevent doing business at Lansing but it did at Grand Rapids, or any other point that they might see fit to build the road to that was touched by the Michigan Central, doing business with any connecting road that formed a line from such point.

Q. You are not connected with the D., L. & N. now? A. No, sir.

Q. Don't own any stock in it?

A. No, sir.

Q. Will you state, as a railroad man and citizen of Detroit, whether there would be any public benefit, whether the business of this company could be more advantageously and properly transacted in the proposed union depot.

A. I should say so, yes, sir.

Q. Would you say that, as a railroad man, from your knowledge of the business of that company?

A. Yes, sir.

Q. It is proposed to build a railroad up River street, an elevated railroad. I suppose you are familiar with the location of the property down there?

A. Yes, sir.

Q. And the Fort Street Union Depot Company has laid out a route for its road along River street. Suppose it is 441 legally impracticable, legally impossible for the Fort Street union depot to acquire the right of way over the property of the Michigan Central, what would you say, that being the case, about the feasibility and the practicability of the route that was selected along River street?

A. I think it is perfectly feasible and practicable.

Q. Do you know of any better route into this proposed union depot?

A. No, sir, not if they could not get in over the Michigan Central

grounds.

Q. If they could get in over the Michigan Central grounds they would have as direct and as good a route?

A. I think so.

Q. But if you cannot go in over the Michigan Central grounds, you think that is the best one?

A. I think it is as good as any. Q. I suppose you have learned something about a locomotive; I do not suppose you are a practical engineer?

A. No, sir, although I have run locomotives a great deal.

Q. Can you tell us how far it is practicable to operate a locomotive upon a trestle-work or an elevated road like this without having the dampers open?

A. It would depend altogether upon the grade and the amount of

steam on hand at the time of starting up it.

Q. Could you have steam enough on hand to go up a considerable grade without the dampers open?

A. Yes, sir.

Q. Is it practicable to do that?

A. Yes, sir.

Q. On this proposed railroad there is a short grade of 52 feet to the mile, and then it is practically level in the union depot grounds. The place where it is 52 feet to the mile is

442 upon the old union depot grounds beyond the foot of Twelfth street, and it is proposed to run an elevated road through River street to the corner of Third street. Will you state whether it would be practicable in operating the railroad, to run over this trestle-work that commences at Twelfth street, and goes through to the vicinity of Eighth street with the dampers closed?

A. It could be done.

Q. Could it be done without any very great trouble or expense? A. I don't think it would cost any more. I don't think it would be done in the regular transaction of the business. I don't think it

would be carried out.

Q. Why? A. Simply because the engineers would not do it. I think it would be a great deal better, if you wanted to avoid smoke and dust, to burn a fuel that it did not make any difference.

Q. Is it practical to use anthracite coal?

A. Yes, sir, or coke.

33 - 55

Q. Would there be any practical difficulty in operating a railroad up this street so as to do away with the smoke and cinders?

A. Not at all. It could be done. You would not have a particle of smoke or cinders if you used anthracite coal or coke for fuel.

Cross-examination by Mr. DICKINSON:

Q. How long since you left the management of the D., L. & N.? A. A year ago last March.

443 Q. Within two years you were still in the management?
A. Yes, sir.

Q. At that time the locomotives were fitted out with substantially the same smoke-consumers that are on the F. & P. M.?

A. Just the same.

Q. After they were so fitted out, or we will say before that, did you observe at any time the D., L. & N. passenger cars after they arrived?

A. Yes, sir; you can't do away with all the cinders.

Q. Can you tell me about how many cinders are taken out of a passenger train of the D., L. & N. coming into the station.

A. They are dropped out at every few stations.

Q. I mean in the passenger trains?

A. I have not any idea.

Q. They clean them out—the passenger cars. You have a person appointed to do that?

A. Yes, sir.

Q. Have you ever seen the amount taken out?

A. No, sir.

Q. The cinder trouble still existed when you left the management of the road?

A. Yes, sir, I never saw a road it did not exist on except the Pennsylvania Central, where they use anthracite coal.

Q. The Pennsylvania, you think, entirely avoids it with anthracite coal?

A. Yes, sir; I never saw any cinders there.

Q. They have a peculiar engine built for that?

A. Yes, sir.

Q. Has to be a special engine for that?

A. Yes, sir.

Q. How many engines has the D., L. & N.?

A. I think they have about forty now. Q. All constructed to burn bituminous coal?

A. Yes, sir.

Q. Do you know of any locomotive that comes into Detroit that

burns anything but bituminous coal?

A. I think not. All locomotives that I know of in the State of Michigan that burn anything else are used in the station at Grand Rapids, where they burn coke.

Q. In your riding out and back on the D., L. & N., your experience, both before and after putting on this F. & P. M. smoke and

cinder consumer, is that cinders will fall into the cars and get in the cars?

A. Yes, sir.
Q. They would cover a newspaper laid down perceptibly?

A. Yes, sir.

Q. And would cover your bags and get in your hair?

A. Yes, sir.

Q. And are very much worse on the platform?

A. Yes, sir.
Q. Will you state whether you do not have your parlor coaches fitted with cinder guards in the windows?

A. Yes, sir. Q. That was to keep out cinders, was it not?

A. Yes, sir.

Q. And you did that before and after you had on the contrivance of the F. & P. M. on your locomotives?

A. Yes, sir.

Q. I show you this map of the Central grounds. Here are the Michigan Central grounds, here are the old union depot grounds, and here it is where they propose to cross into River street at Twelfth. Now taking the line of the union depot track 445 running along the margin of the old union depot grounds, what from that point at Twelfth street, is the most practical route

and the best route into the depot grounds? A. The most direct line would be the most practical.

Q. Which is that? A. Following along the margin of the Michigan Central property.

Q. That would be the best route, would it not?

A. In my opinion.

Q. Mr. Baker has asked you about legal difficulties. Do you know of any legal difficulties in the way?

A. I do not; I am not an attorney.

Q. Who is the general counsel of the D., L. & N.?

A. Mr. Charles B. Lothrop.

Q. Mr. G. V. N. Lothrop before that?

A. He was formerly.

Q. That being the best route, was there ever any talk about the power of the railroad company wanting terminal facilities to condemn the Michigan Central ground?

A. Mr. Lothrop told me at one time there was no difficulty in

doing that.

Q. Which Lothrop?

A. G. V. N. Lothrop. Q. The most direct route you think would be up the margin of the Michigan Central?

A. That would be the most direct line.

Q. In the Michigan Central yards, between Twelfth and Third streets they do a passenger business?

A. Yes, sir.

Q. And they do a freight business there?

A. Yes, sir.

446 Q. Most always you find freight cars standing in their vard filling it up?

Q. All above Twelfth street is frequently stored full of freight cars?

A. Yes, sir.

Q. If there can be conducted under this elevated structure on River street a switch over which may be done all the freight business of such factories as the Diamond Match Company, and stove works, and Union mills, where freight cars can be run under with the locomotive of this elevated structure, standing sufficiently high in the clear to permit the conduct of freight business under that track, do you see any reason why, if the Michigan Central desired to use a track on the margin next to River street, they could not as well conduct a freight business under that as can be done on the switch-engine under the elevated structure; do you see any practical difficulty?

A. I think not.

Q. So that if the elevated structure was run over there, the Central could carry on a freight business under that margin?

A. Yes, sir.

Q. They do not now need or use the space that would be used by the elevated structure?

A. No, they do not use the space above ground.

Q. Have you noticed the old freight sheds and tumble-down brick house they have on the margin along River street?

A. I know they have some buildings there.

Q. Do they use them for anything?

A. I do not know, I am sure, whether they do or not.

447 Q. You did your business there with the Michigan Central for the D., L. & N. so far as the practical conduct of the business was concerned, to say nothing of the annoyance from competing road, you carried it on well, didn't you?

A. Yes, sir.

Q. The passenger trains ran in and out in good shape?
A. Yes, sir.

Q. They had no more than the ordinary delays in any depot?

A. No. sir.

Q. You had a contract made with them when they agreed to give you place that you would not compete with them?

A. Yes, sir.

Q. That was the difficulty? A. Yes, sir.

Q. You were perfectly comfortable so far as the running of your road was concerned on their grounds and depot?

A. Yes, sir.

Redirect examination:

Q. You say G. V. N. Lothrop was counsel for the D., L. & N. Did you get his opinion on the right to condemn a line of road across the Michigan Central?

A. He gave me his opinion once.

Q. In writing? A. No, sir.

Q. How long ago was that?

A. I think it was the year before he went to Europe.

Q. Where did you see him?

A. In his office.

Q. Did you go there and ask for his formal opinion?

A. No, sir, I was talking over the general situation of our 448 company with the Michigan Central.

Q. Did he make any examination of the subject while you were

there?

A. No, sir.

Q. Did he answer you immediately?

A. Yes, sir; that he did not think there would be any reason why the Lansing Company could not condemn a line down the Michigan Central if they wished. Q. Down from where?

A. From the junction into Detroit.

Q. Right over the Michigan Central? A. Over the Michigan Central ground. Q. He expressed that opinion to you?

A. Yes, sir.

Q. It was without any examination? A. That was without any examination.

Mr. Dickinson: That you saw.

Q. He answered you immediately?

A. Yes, sir.

Q. Was not that opinion right the other way?

A. No.

Q. Have you talked with Mr. Lothrop about it recently?

Q. Never talked with him about it since?

A. No, sir.

Q. Don't you think that opinion was right the other way?

A. I don't think it was.

Recross-examination:

Q. You became the manager of the D., L. & N. how many years ago?

A. Fifteen.

449Q. When you became the manager Mr. Lothrop was counsel?

A. Yes, sir.

Q. And continued so until he went to Europe in 1885?

A. Yes, sir.

Q. Mr. Baker has asked you whether he gave it any examination; was Mr. Lothrop accustomed to give you superficial opinions in your experience?

A. I don't think so.

Q. You usually could rely upon his opinion?

A. I always found his opinions good.

Q. You found him pretty level-headed ordinarily?

A. Yes, sir.

Q. When you say he gave it in conversation with you without examination, you mean he did not examine it there and then?

A. He did not examine it there and then. He did not examine it, he simply said he did not believe there would be any reason why we could not go over the Michigan Central grounds. We were talk. ing in regard to legislation necessary to get into Detroit.

Q. Did he refer to a piece of legislation?

A. No; about getting legislation. He did not think there would be anything to prevent it.

Q. Did he say anything about a piece of legislation passed in

1881?

A. I don't think so. That was the Saginaw matter, wasn't it?

Q. He thought there would be no difficulty in getting an act under which you could condemn even the right of way in from the junction?

450 A. That was his opinion.

Q. You were not talking about getting depot grounds in the city?

A. No, sir, only the right of way in.

Mr. Baker: Mr. Lothrop did not tell you you could do that without additional legislation?

A. No, sir.

Q. Did he tell you if you got a bill passed authorizing it it could be done?

A. Yes, sir.

Q. You would have to get the bill passed first?

A. Yes, sir.

FREDERICK T. RANNEY, sworn for petitioner.

Examined by Mr. BAKER:

Q. Where do you live?

A. Detroit.

Q. What is your business?
A. Real estate—buying and selling.

Q. You have been in that business some little time?

A. Since 1884.

Q. Are you familiar with the value of property in the vicinity of A. Backus, Jr., & Sons' planing mill?

A. Considerably so.

Q. Do you know the value of the property situated on the north side of that street, between the Michigan Central railroad and Twelfth street?

A. Yes, sir.

Q. Suppose the Backus property were vacant, it has a frontage on

River street from the railroad of 238 feet, and it extends through to Fort street, and has a less frontage on Fort street, 451 and it also abuts on the Michigan Central on an angle. Take the River Street front, running back halfway, what, in your judgment, would the value of that land be per foot front, say if it were vacant today and it was placed in your hands for sale, what could you realize for it, in your judgment?

A. It varies in value along there from Twelfth to the railroad.

Q. Take the Backus property itself, next to the railroad.

A. I think it is worth about \$100 a foot.

Q. Do you think you could get that for it?

A. I think I might.

Q. How much more do you think you could get for it than that?

A. Could not get much, if any more.

Q. What would the Fort Street front be worth per foot front?

A. I think it is worth about the same.

Q. So that, taking the property right through to Fort street, you would value the entire of both fronts at \$200 a foot?

A. Yes, sir.

Q. What do you base that opinion on? A. That is from my general knowledge of the property in that vicinity.

Q. Upon your knowledge of the property and of the prices that are paid?

A. Yes, sir. Q. What effect do you think the construction of a proposed elevated road in front of that property would have on real estate, as a piece of manufacturing property, upon the market value of it?

A. I think it would affect it some, but not much.

DAVID H. SUTHERLAND, sworn for petitioner. 452

Examined by Mr. Baker:

Q. What is your business?

A. Division superintendent of the Michigan Central.

Q. How long have you been?

A. Since 1881.

Q. How long have you worked for the Michigan Central? A. Twenty-seven years.

Q. What are your duties as division superintendent?

A. I have charge of the operating department, the train service, switching and train service.

Q. How far out on the roads does your jurisdiction extend? A. Three divisions out of Detroit—Toledo, Jackson and Bay City. Q. You have control of the road to Bay City and out as far as

Jackson and down to Toledo?

A. Yes, sir.

Q. The Grand Rapids road branches off from Jackson?

A. Yes, sir. Q. The Michigan Central has these three divisions running out of this city?

A. Yes, sir.

Q. You have charge of the operating department, the management of trains and the service on those divisions?

A. Yes, sir, the yard service and station service.

Q. You have control of all the yards that are located in Detroit? A. Yes, sir.

Q. About how many miles of track have you in Detroit. in the city of Detroit; I do not confine you necessarily to 453 the city limits?

A. We have about 75 miles of track in what we call the Detroit yard.

Q. Where are those tracks located, in what places?

- A. We have the Detroit yard proper between Third and Twelfth streets, the yard at Twentieth street, and a large yard at West De-
- Q. Take this yard between Twelfth and Third streets; the Michigan Central occupies all of that preperty from Twelfth to Third street and south of River street, does it not?

A. Yes, sir.

Q. Will you state whether or not the Michigan Central railroad is in the actual occupancy of all that property?

A. Yes, sir.

Q. What do you do on those grounds?

A. We handle our passenger trains, our city freight and our through business across the river, our elevators and our custom business in Detroit.

Q. Do you use that as a place to store cars?

A. No, sir; it is used in the actual handling of Detroit business and the business that crosses the river.

Q. Do you use all of that property for that purpose?

A. Yes, sir.

Q. Do you need it all in order to do the business?

A. Yes, sir; our facilities are cramped now.

Q. The business of the road, I suppose, increases some every year?

A. Yes, sir; there is almost a steady increase from year to

454 Q. Can you tell us about how many cars you handle at the Third Street depot daily?

A. There are received and dispatched from 2,300 to 2,700 cars per day.

Q. Those that come in and go out?

A. Yes, sir.

Q. Does that entire number come to this Third Street depot?

A. No; part of that does not come into the Third Street yard. About three-quarters of it has to pass through the Third Street yard.

Q. The rest, I suppose, goes to the Grand Trunk and stops at Twentieth street?

A. Yes, sir.

Q. Have you the cattle yard at Twentieth street?

A. At the South Junction yard.

Q. You have an elevator on this yard?A. Two elevators.

Q. You have no elevators down below?

A. We have no elevators out of the city at all.

Q. You have had charge of this department how long?

A. As division superintendent since 1881; as trainmaster since 1875.

Q. What did you do on the road before that?

A. I was in the yard as yardmaster.

Q. You have been familiar with the business of that road a good many years?

A. Twenty-seven.

Cross-examination by Mr. Dickinson:

Q. How many trains go in and out a day, including the Detroit, Lansing & Northern and the F. & P. M.? 455

A. We handle about 65 trains a day in and out.

Q. How many freight trains?

A. That varies a great deal.

Q. Give us the maximum and minimum.

A. The Michigan Central business runs from 25 to 35 freight trains each way a day.

Q. How many of the other roads?

A. That includes the Michigan Central and the F. & P. M.

Q. The D., L. & N.? A. Their trains are broken up before they come in.

Q. How many acres do you use down there?

A. That would be a difficult question for me to answer; we have a very large holding.

Q. Suppose you did your freight business at the junction, or outside, how much depot room or yard room would you actually need for your passenger business?

A. The freight is not brought to the Detroit yard until it is ready to deliver to the Detroit yard or across the river. The other handling and switching is done at the junction yard.

Q. It is perfectly convenient to do the Detroit freight business

where you do it at the junction?

A. We do not do any Detroit freight business—we are compelled to do that because there is not room in our Detroit yard to do it.

Q. When you do it down there it is convenient for your business?

A. Yes, sir.

Q. How many acres have you down there?

A. We have got a plat down there, I think, very nearly a mile square.

Q. How much room would you require to do your passenger business at the Third Street depot with sixty-eight 456 trains a day?

A. Our passenger business takes up about one-quarter of our Detroit yard.

34 - 55

Q. Would you take about ten acres?

A. It would take about a quarter of the facilities.

Q. Are you familiar with the business of other depots?

A. I have had considerable experience.

Q. Do you know the St. Louis union depot?

A. Yes, sir.

Q. Do you know that they have two hundred and forty-four trains a day in and out? A. No.

Q. Do you know about the New York Central, two hundred and thirty-eight trains a day, in and out; about what acreage is occupied there?

A. I don't know.

Q. You could do the business of sixty-eight trains a day on the space that is occupied by the New York Central, could you not, where they accommodate two hundred and thirty-eight trains a day?

A. The handling of passenger trains depends a good deal on what

kind of a station they have.

Q. If it be true that they handle two hundred and thirty-eight trains in the New York depot, you could handle sixty-eight trains in the same space?

A. I could not say that.

Q. If they handle two hundred and forty-four trains a day in the union depot at St. Louis, you could, on the same space they occupy, handle sixty-eight?

A. It would depend a good deal on what kind of trains, whether

terminal trains.

457 Q. Terminal trains?

A. I know that our facilities are limited to the business we do on them.

Q. You want more land, don't you?

A. Yes, sir.

Q. You did not know that you had the largest holding of any railroad in the country near the business center?

A. No, sir.

Q. You think if trains were handled in the same way at the Michigan Central, on the yard, as at St. Louis, where they handle two hundred and forty-four trains, you think you could handle sixty-eight trains on the same territory?

A. Terminal trains, yes, sir.

Q. And so with the New York Central at Indianapolis or any other center?

A. Yes, sir.

Q. You say the cars in the yard, between Third and Fourth, are cars that go through?

A. The cars that come into the yard are cars for Detroit delivery, elevators and the business that is going through across the river?

Q. What amount is there for Detroit package business?

A. We load in Detroit about 200 cars a day, the out freight we handle very nearly the same amount of in freight.

Q. About 400 cars a day?

A. Yes, sir; and then we have our elevator business; that runs from 40 cars a day to 200.

Q. What amount do you send through over the river?

A. It will average nearly 1,000 cars a day.

Q. That is, including through as well as local freight?

A. Including all cars.

Q. The thousand cars a day of through freight go either West or East?

A. Yes, sir.

Q. The thousand cars a day of freight coming from the East, which is through freight, is there anything standing in the way of your taking that right off the boat and taking it to your yards at the junction?

A. It would be impossible in the ordinary handling of business. We have to have more or less freight ready for the boat in order to handle it. We have to get it inspected and taken care of in order

to load on the boat.

Q. It could be inspected advantageously at your freight depot?

Λ. Not for the crossing.
Q. When it comes over?

A. I was speaking of the freight going through; our freight coming from the boat is brought in and taken to the junction yard.

Q. You do not use it in the yard? A. A good deal of it is left here.

Q. Today there are standing on the tracks down there—that yard is pretty well filled, since this suit commenced, at all events, with freight cars?

A. I have never seen it when it was not filled.

Q. A good many empty cars?

A. Empty cars for the Detroit business.

Q. How long have the empty cars standing by the fence stood there?

A. What fence?

Q. Over this way, towards River street.

A. Those are shifted every night.

Q. What do you use the building for along River street; the old brick building and frame building?

A. The frame building is not there; the brick building is used for delivering city freight.

Q. Do you receive and deliver city freight there?

A. No, sir, we deliver it there. Q. Where do you receive it?

A. On the river side.

Q. Do you contemplate, in your railroad business there, that you will have to use, in the transaction of your business in that yard, elevated tracks?

A. No, sir, not that I know of.

Q. Not on your present arrangement?

A. No.

Q. Your yard crosses no streets; you have no use for an elevated

A. Not between Twelfth and Third streets.

Q. You could not use an elevated track there on trestles to do your business.

A. No, sir.

Q. You do not need it?

A. Could not use it.

By Mr. CHAREST:

Q. You say that at the present time you want all the room you have?

A. Yes, sir, they are cramped now for room.

Q. After the F. & P. M. and the D., L. & N. leave the Michigan

Central, won't that make you any easier in your room?

A. No, sir; we have plans now for increasing our yard to a very great extent by moving more of our business to the junction yard.

By Mr. Dickinson:

Q. You have given the number of freight trains and the number of passenger trains; has that increased in the last ten years, or is it about the same?

A. It has increased.

Q. How much?

A. Our cars have increased in the last five years, I should judge, fully 20 per cent.

Q. How much in ten?

A. The business has changed a great deal in ten. We have more territory emptying in. I should judge we were handling over 50 per cent. more in the last ten years.

Q. You are now handling what the F. & P. M. and the D., L. &

N. business brings?

A. That comes through our yards.

Q. When did the Grand Trunk buy the D. & M.?

A. I don't remember.

Q. You had charge of the yard during that period?

A. I don't remember what year.

Q. Formerly you received in your yard, in addition to your own business, the Great Western freight for the Grand Trunk in the same way?

A. Yes, sir, but we did not at that time have any connection with

our own Eastern business.

Q. Since you have had your Canada Southern connection you

have received Grand Trunk freight and passengers?

A. Not since we got the permanent connection. The Canada Southern formerly made their connection with us at West Detroit, and when it was turned over to the Michigan Central and brought to Detroit we then severed our connection with the Great Western.

Q. Did not the Grand Trunk trains come in at the Michigan

Central?

A. The Grand Trunk passenger trains ran in there for a little while.

Q. Didn't they run in there all the while for the last 20 years?

A. They did before that.

Q. The Great Western came to the Michigan Central? A. Yes, sir.

Q. And the Grand Trunk left the Michigan Central?

A. Yes, sir.

Q. That was about 1886? A. I don't remember what year.

Q. Were you overcrowded?

A. I have never known the time we were not overcrowded in the Q. You are very much crowded by the D., L. & N. and the F. & P. M.?

462

A. And the Michigan Central business we are extending outside. Q. How long has it been since you have taken the Bay City road

into the Michigan Central?

A. I can hardly tell you that. I have only had charge of the Bay City division about two years, but it was Michigan Central before that; how long I could not teil.

Q. Can't you say it was over two years prior to your time?

A. Yes, sir.

Q. Can you fix any period?

A. I could not.

Q. The Mackinac line runs a through fine up to the Straits recently?

A. That is the Bay City division.

Q. It runs its own cars.

A. It is always run on the Bay City road.

Q. You have taken in the Mackinac?

Redirect examination by Mr. BAKER:

Q. Is it practical to do a railroad business in the city of Detroit without having your elevators located on the river?

A. I should say not.

Q. Whether the Michigan Central maintains a ferry in connection with its Third Street yard?

A. Yes, sir.

Q. The freight business, I suppose, the cars are not detained on this yard for the through business any longer than it is necessary to handle them?

A. We try not to detain them any longer than is possible.

Q. Would it be practical to do that ferriage business without a considerable yard to operate cars in connection with the ferry?

A. No, our breaking up and all that is done at the junction yard. All that is done in Detroit is what is simply necessary for the loading and unloading of Detroit and doing the Detroit business.

Q. Could you do that ferriage if there were nothing else without

a considerable yard?

A. No, sir.

Q. You say you take cars there daily, about 1,000 cars?

A. Yes, sir.

Q. The Michigan Central connection east, at the present time, is through a branch that runs from Windsor and Essex Center, connecting with the old Canada Southern line through to Buffalo?

A. Yes, sir.

Q. A good many years ago it connected with the Great 463 Western '

A. Yes, sir.

- Q. But upon the acquisition or obtaining control of the Canada Southern, the business has been transacted over that line alone? A. Yes, sir.
- Q. And the Great Western has passed into the control of the Grand Trunk?

A. Yes, sir.

Q. You maintain no ferry with the Great Western depot?

A. No, sir.

Q. You ferry across to the Canada Southern depot?

A. Yes, sir.

Q. You say the passenger business down there takes about onequarter of the ground?

A. Yes, sir.

Q. Is that amount of ground necessary to do the business in the Michigan Central, as it is at present conducted?

A. Yes, sir.

Q. Could you get along with any less ground there either for the freight business or the passenger business to be transacted on your grounds, between Third and Twelfth streets, if the D., L. & N. and the F. & P. M. should move out of there?

A. I don't think we could. Our own business is increasing so

that we would probably take up all the room.

Q. You need about so many tracks in order to transact the business properly?

A. Yes, sir.

Q. Is it true that you use any of the tracks down there on the Michigan Central grounds for the purpose of storing cars? 464 A. No, sir, it is used entirely for the Detroit business and

for the through business. Q. How long do the cars stay on that track ordinarily, day in

and day out? A. Our average of cars in there for unloading is about a day and five hours.

Q. Do you mean a day of 24 hours?

- A. Yes, sir. There would be some cars that would go out in two or three hours, and other cars might stay two days in getting unloaded.
- Q. That includes bringing them in and unloading them, and loading them up again, and taking them out?

A. Bringing them in and unloading them.

Q. How long are the cars shifted upon these tracks that are along the margin of River street?

A. Those tracks are switched every night.

Q. That is, you have your team tracks along there?

A. Yes, sir.

Q. By team tracks, as I understand it, you mean tracks to which a vehicle can be driven alongside of the cars?

A. Where we deliver what we call our car-load freight.

Q. Teams go in there and take the freight right out of the cars and go away with it?

A. Yes, sir.

Q. Or they bring it there and unload it?

A. Yes, sir.
Q. You take the cars in there and take them away every night?

A. No, we do not take them away, the tracks are switched over. There would be cars maybe standing there two or three days before we get the loads out of them. We cannot always get our cars released.

Q. Your patrons do not take the freight away right off?
A. No, sir. 465

Q. They have to have time to haul it away load by load.

A. Yes, sir.

Q. As soon as a car is empty is it shifted?

A. Yes, sir.

Recross-examination by Mr. Dickinson:

Q. Do you know of any other passenger depot in the United States that does a freight business alongside of its passenger depot in the city except the Michigan Central and the railroads of Detroit? Name one.

A. It would depend a great deal-

Q. Do you know of any place in the United States where it is done? A. Yes, sir; it is done in Toledo by some of the roads there.

Q. Any other place?

A. The Pennsylvania road in Toledo do their business in the same yard.

Q. Where is their depot?

A. In what is called North Toledo.

Q. Out of the town?

A. Right in the city of Toledo.

Q. How long a ride is it from the Michigan Central depot to the North Toledo depot?

A. A street-car ride of about 15 minutes.

Q. Isn't it clear to the other side of the town?

A. It is not a great distance, it is the other side of Toledo.

Q. The Michigan Central business is quite near the business center of Toledo?

A. No; it is on one side of the town and the Pennsylvania is on the other. The old station is right at the bridge, but 466 the new station is further up; I should judge half a mile further up.

Q. Which way? A. Nearer Detroit. Q. It is further out of town than it used to be?

A. Yes, sir.

Q. About half a mile further up?

A. About half a mile.

Q. How far is the North Toledo depot from the old station ground where the Island house was?

A. I should judge about a mile and a half.

Q. Across town?

A. Yes, sir.

Q. And the Michigan Central depot has been moved back up towards Detroit about half a mile?

A. Yes, sir.

Q. In the old station they did not have any freight depot along. side?

A. Yes, sir.

Q. Has it moved that back?

A. No, the height-house is there yet, and the Island house is the freight-house.

Q. Name another city where that is done?

A. We do our business in Jackson in the same way, and our freight-houses in Chicago are right alongside of the depot.

Q. The Illinois Central yards?

A. Yes, sir.
Q. You are doing business on the Illinois Central grounds?

A. No, sir, we have property of our own. We go in on the Illinois Central track.

467Q. That property, the Illinois Central, was acquired about the time the Michigan Central acquired its property here?

Q. Do you know where the freight business is done in the city of New York?

A. No, sir.

Q. You did not know it was done at the river side?

A. No, sir.

Q. You have spoken of Chicago; where is the Dearborn Street depot freight business done?

A. I am not very well posted in the streets.

Q. Or the Canal Street depot? A. I could not tell you that.

Q. You have said, in answer to Mr. Baker, that as soon as you made connection with the Canada Southern, then, as I understand you, the Great Western and Grand Trunk were taken out of the Michigan Central; do you mean to be so understood?

A. If my memory serves me right.

Q. You acquired the Canada Southern connection in 1878.

A. 1881.

Q. After you acquired the Canada Southern connection, the Grand Trunk did not buy the Great Western at the same time?

A. I don't remember when the Grand Trunk did. If I remember rightly, we did not have the Grand Trunk trains in the Detroit depot after we acquired the Canada Southern road.

Q. Did you have the Grand Trunk trains in the depot until the Grand Trunk bought the Great Western and D. & M.

A. I think we did.

Q. If that was later than the time you bought out the Canada Southern, you still continued then in the depot after you bought the Canada Southern?

A. If my memory serves me right, we did not have the Great

Western in our depot after we acquired the Canada Southern.

Q. Did you have the Great Western and Grand Trunk in your depot until the Grand Trunk had bought the Great Western?

A. I could not say as to that.

Q. Did you have the Grand Trunk in your depot until the Grand Trunk bought the Great Western?

A. I think we did; I am not positive.

Redirect examination by Mr. BAKER:

Q. You say you are not very familiar with the freight business in New York?

A. No, sir.

Q. You know, do you not, as a railroad man, from the character of the freight that goes to New York, it would be necessary to go to the water's edge?

A. All their through freight. I suppose they have a city freight

business the same as we have.

Q. You would naturally expect that the freight business would be located on New York harbor. They would have some freight facilities there?

A. Yes, sir.

Q. The foreign freight and the shipments of freight would naturally go to the water's edge?

A. Yes, sir.

Q. The Michigan Central has always done a very large through business, and it has been done with a slip in these yards? 469 A. Yes, sir.

Q. Did you ever do any business down at Grosse Isle?

A. The Canada Southern did, not since the Michigan Central acquired it. When there has been a blockade here we have done our business at Grosse Isle.

Q. Was that before the Michigan Central acquired control of the

Canada Southern?

A. We have done it since.

Q. Have you made it a business to use that?

A. For the purpose of carrying over through freight, not since we have had our slips finished at Detroit. We had to put in slips to fit their boats.

Q. I suppose it would be practicable, if there were any necessity for it, to take the freight business down all to Grosse Isle, and take it all through that way without bringing it to Detroit at all?

A. It is a longer route.

Q. But you could haul it around there?

A. Yes, sir.

Q. I suppose you could take it around to Toledo?

A. We have had to do that in blockades.

Q. During the war, you remember the soldiers had to go around there because of the neutrality of England, that would not let us take troops through Canada?

A. I was very young at that time.

Recross-examination by Mr. Dickinson:

Q. You say the Central yard is required because of the landing of steamers; how much land does the Canada Southern use as freight yard on the other side of the river?

A. I could not tell you; we have a very large yard.

Q. How much do they actually use for the yard?

A. We have quite a yard there that would hold probably 470 a thousand cars.

Q. How many acres in it?

A. I do not know what the acreage is. Q. Are there five with your tracks in it?

A. Yes, sir. Q. Will you swear there are ten?

A. Yes, sir.

Q. How much is there there?

A. I could not tell you just what the size is.

Q. It is all right there, any one can see when they cross over? A. No; our yard lies from the river right up into Windsor, up the hill.

Q. How many acres are there there?

A. I could not tell you what the acreage is. Q. You run the freight up the hill there?

A. Yes, sir.

LEWIS F. PHISTER, sworn for petitioner.

Examined by Mr. BAKER:

Q. What is your business?

A. Real estate.

Q In Detroit?

A. Yes, sir.

Q. How long have you been in the real-estate business?

A. About six years.

Q. You have a knowledge of real-estate values in Detroit?

A. Yes, sir; generally.

Q. Do you know the property known as the Backus planing mill and box factory?

A. Yes, sir.

Q. That property has a frontage on River street of 238 feet, on the north side of the street, and it is bounded on the east by the Michigan Central railroad, I would like to know what, in your judgment, is the market value of the land, suppose it were vacant

land and in the market for sale, for manufacturing or any other purpose for which it could be used; what do you think could be realized for it at the River Street front?

A. About \$150 a foot.

Q. You think you could get that for it?
A. I think so.

Q. Halfway back to Fort street?

A. Yes, sir.

Q. What would the Fort Street front be worth?

A. I think about the same value.

Q. There would not be very much difference?

A. I should not think so.

Q. It is proposed to build an elevated road along River street in front of that property that will leave the street open so that traffic can go on up and down the street. To what extent, if any, would the construction of a road along River street affect the market value of that piece of land as a piece of real estate?

A. I gave an opinion on that once before, that I did not think it would hurt it any. I don't think I should change my opinion now. I have viewed the property. I do not think it would be any dam-

age to the property for the business it is used for.

Cross-examination by Mr. Dickinson: 472

Q. How long have you been in this city?

A. Nearly 19 years.

- Q. Been in the real-estate business all the time?
- A. No, about a third of the time, for the past six years. Q. You bought and sold property in this neighborhood?

A. I have sold property there.

Q. Whereabouts?

A. On River street, between the railroad and Twelfth street.

Q. Sold to the union depot company?

A. No, sir.

Q. What was that property?

A. It was what has been recently used for the graphite works. The place belongs to Boynton.

Q. Below Backus'?

A. Yes, sir, about 100 feet, or a little less, east of Twelfth street.

Q. Did you sell it?

A. Yes, sir.

Q. How deep was it?

A. Somewhere in the neighborhood of 148 or 150 feet, I think.

Q. Any building on it?

A. A factory. Q. What did you sell that for per front foot? A. About \$80.

Q. Buildings and all?

A. Yes, sir.
Q. You sold it to whom?
A. To John A. Russell, I think, was the buyer.

Q. When?

473 A. About two years ago.

- Q. Did you know of the sale of the corner lot on Twelfth street?
 - A. I heard of it shortly before that time.

Q. What did that sell for?

- A. My recollection is that it brought considerable more money. It is a larger piece and runs through from River street to Fort street.
- Q. Is the Fort Street front worth as much as the River Street front?

A. I should not say there was much choice between them.

Q. What did the corner sell for?

Mr. BAKER: I object to that. It appears what it was sold for and the circumstances under which it was sold.

A. I don't recollect what it was sold for.

Q. Any other sales down there?

A. None that I made myself; I know of some other sales.

Q. Do you know of the sale of the D., L. & N. to the Michigan Central, 160 feet front?

A. I recollect reading of it. Q. Do you know the price? A. No.

Q. Who sold the graphite front?

A. The party for whom I sold it had it on contract, M. P. Thatcher. The title was in George C. Langdon and some other party.

Q. Thatcher held it on contract?

A. Yes, sir.

Q. Was the contract pledged? A. No, not exactly pledged.

Q. How was it?

474 A. He had it on contract, and it was rather what we would call a forced sale.

Q. Langdon failed, too, didn't he? A. Not that I know of at that time.

Q. Wasn't he embarrassed at that time?

A. I don't think this sale benefited him any.

Q. How was it a forced sale?

A. Captain Thatcher was unable to keep up the contract, I think, and was somewhat in arrears and very anxious to sell it. It was not exactly a forced sale, but it was in the market, and was sold a little less than we would have sold it if he had been in easy circumstances.

Q. How much is the front?

A. I think it is 45 feet.

Q. How deep, do you say?

A. I think somewhere between 140 and 150. Q. Did it go halfway through the block?

A. I think a little more than half; I have not refreshed my memory on it, but that is my recollection.

Q. You don't think this would injure the property at all, this levated road?

A. That is my opinion on it.

Q. Are you familiar with the effect of elevated roads for trunk lines?

A. The only ones I know of are the New York roads.

Q. You are not familiar with the effect of trunk roads elevated upon trestles by property?

A. No, I cannot say that I am.

Q. Never had any experience with them?

A. No; we have not got that far.

Q. Do you know anything about the Backus property?

A. I know where it is located.

Q. Do you know anything about the kind of mill it is? 475 A. Yes, sir.

Q. Have you been inside the mill?

A. I have been in the yard; I have not been through the mill.

Q. Do you know what kind of business they do?

A. No. Q. You have never seen the operation of elevated roads except the New York passenger roads, and you testify to this that you are very clear it would not be any injury to the property, although you have never been in the mill and never had seen the operation of the road?

A. I testify that is my opinion of it.

Q. Did you know that this kind of business created such a fine dust that they were obliged in their business to provide a dust-room for the dust?

A. I know there is something of that nature.

Q. Did you know that that was highly inflammable, so that a man smoking would explode it?

A. I know that smoking is not allowed.

Q. So that a spark would explode it, did you know that?

A. I presume any fire.

Q. Did you know it was highly explosive?

A. Yes, sir.

Q. Do you know how close the proposed elevated road would run to the building?

A. Yes, sir.

Q. How close to the property?

A. The tracks would come within 25 or 30 feet.

Q. You know there were to be tracks and switches in front of it?

A. I know there are to be tracks.

Q. How many? 476

A. Two tracks, I suppose.

Q. Did you know how many railroads were to run over there into the depot?

A. Three or four roads, I believe.

Q. Simply from your observation of the elevated roads in New York you think it would be no injury to this property?

A. I don't think it would in this elevated case.

A JURER: Do I understand you the valuation is merely on the bare real estate?

A. Yes, sir.

Q. Your damages would be merely for taking the ground, regard-

less of the buildings on it at present?

A. I could say why I form an opinion that it would not be any damage. I could not see from my inspection of the ground and the trestle that it would interfere with the traffic of teams, and I was assured by different parties that the insurance risk would not be increased by the construction of that road. Based upon that fact I thought it would be no real practical injury to the property.

Q. For instance, if the ground was bare, without any buildings, do you think you could sell the property for as much money per foot after that railroad ran overhead as you could today; and for

what purpose?

A. That is a very problematic thing. There might be some party that wanted that property for a purpose where an elevated railroad would be perhaps a benefit instead of an injury.

Q. How could it be a benefit?

A. The fact that it would have another line of road.

Q. How could you use an elevated road?

A. They could put switches from the property.

477 By Mr. BAKER:

Q. Have you seen other elevated side tracks in other cities?

A. I have observed side tracks in New York.

Q. An elevated side track is just as feasible as a surface track?

A. I suppose so; I take it for granted that anything is feasible nowadays.

Mr. Baker: I now propose to read in evidence the testimony of David Beveridge, which was taken in the case against Kidder et al., Mr. Beveridge being absent in Europe.

The testimony is as follows:

Q. What is your business?

A. Inspector of buildings for insurance companies.

Q. Whereabouts are you located?

A. Detroit.

Q. How long have you been here?

A. Three and a half years.

Q. How long have you been in the insurance business?

A. Over 20 years.

Q. What are your duties as inspector?

A. To examine the different hazards in buildings and the method of construction of buildings.

Q. For what purpose?

A. For the purpose of reporting to the companies to establish an insurance rate.

Q. You go and look at the property, make a survey of the proprty, and recommend a rate?

A. Yes, sir.

Q. How many companies do you do that for?

A. Three.

Q. Are they prominent companies?

A. A. The Michigan Fire and Marine, the Detroit Fire and farine of this city, and the Grand Rapids Fire Insurance Comanv.

Q. Any other companies use the same rates?

A. They buy our reports, quite a number of other companies. Q. Any other companies outside of the State buy your reports?

A. Yes, sir.

Q. That is you furnish them a report for a consideration?

A. Yes, sir.

Q. You have done this for the last two years in this city? A. Two years and a half.

Q. I suppose you know the property along the north side of liver street where the Michigan Central railroad crosses?

A. Yes, sir.

Q. On the north side of that street, and situated adjoining the remises of the Diamond Match Company on the one hand and the eninsular stove works on the other, is a piece of property with a ontage of 140 feet on River street, and upon it is situated a flourig mill some small distance back from the street line. The Fort treet Union Depot Company propose to build an elevated road in nat street on which three railroad tracks will be maintained, and

the tracks will be at an elevation of about 24 or 25 feet, or a 79 little higher, and the elevated road, the nearest it will come to the flouring-mill building is 30 feet at one end and 35 feet t the other. The building does not stand exactly square with the

treet, that is the end of the ties, which are nine feet wide, will ractically represent the outside of the cars, so that we can say hat the locomotives and cars will run within 30 feet of the buildng at this elevation. There are some windows on the side next to he elevated road, and on the lower floor are doors by which ingress nd egress are obtained; and it is proposed to operate the road with nproved engines and fire-boxes, and all the modern first-class apliances in regard to fire, and you will tell us whether or not there ould be any increase in the fire risk because of the operation of ach a railroad in front of a flouring mill in that way?

A. There would not.

Q. So that if this mill were insured at the present time, upon the ompletion and operation of such a road, there would be no increase the rates on the part of the insurance companies?

A. There would not, if the conditions are as you have stated.

Cross-examination by Mr. Dickinson:

Q. You have been a witness before for the union depot company? A. Yes, sir.

Q. Did you testify that the rate would not be increased in the Backus case for running through their lumber yard?

A. Yes, sir.

Q. Did you know that afterwards the rate was doubled on them since the railroad went through?

A. I do not.

Q. You have heard that since, have you not?

480 A. No, sir.

Q. You testified that the rate would not be increased?

A. I testified that it would not be increased on account of the elevated railway.

Q. Have you ever insured a flouring mill?

A. Yes, sir.

Q. Are they considered extra hazardous?

A. Yes, they are more than that, they are considered specially hazardous.

Q. You always put a clause in the policy providing that there should be no open light used, precisely as in a powder magazine?

A. I have never known of insuring a powder magazine.

Q. Have you seen a policy on a flouring mill?

A. Yes, sir.

Q. Do you know that that is the rule about powder magazines, not to use open lights?

A. I suppose so.

Q. What is the reason you put a clause in policies on mills of this description, that no open light should be used?

A. Because there have been a great number of explosions which

have occurred in flour mills.

Q. The dust of a flour mill is very explosive?

A. Yes, sir.

Q. It will ignite from an open light?

A. It will in summer when it is very hot.

Q. You base your testimony on Mr. Baker's statement about the provision against fire from a railroad?

A. Yes, sir.

Q. You understand that a number of roads are to use these three tracks in front of this flour mill?

A. No, sir.

481 Q. How did you understand it?

A. I understood that there were three tracks for the Fort Street union depot.

Q. Did you understand that all roads are expected to come in

there?

A. I do not know how many roads are coming in there.

Q. You think there would be no extra rate charged where four great trunk lines run through there with the standard locomotives, carrying freight and passengers?

A. If the conditions are as Mr. Baker stated.

Q. What are those conditions?

A. That they shall have all the modern appliances of shutting

down dampers and burn coal, and also carry out the ordinance of most cities, that sparks shall not be emitted.

Q. If that is done you do not think that the rate would be in-

creased?

A. No, sir.

Redirect examination:

Q. The special hazards connected with the flouring-mill business arises from the nature of the work that is done in the mill?

A. Yes, sir.

Q. And the provision in regard to not carrying an open light is

to avoid igniting the dust or gas that is in the mill?

A. Yes, sir, any dust that may be floating around in summer; it is more or less dangerous, especially in summer. It is doubtless so in winter, but the explosions that have occurred from dust have generally been in summer.

Q. I suppose it is a gas that forms?

A. Yes, sir.

Q. What do you mean by a provision against an open

light?

482

A. Any open light, whether it is an open kerosene lamp or an open candle, or any light that is not protected by what is called the Davy gauze.

Q. Take an ordinary lamp that has to have ventilation, how do

you get a cover on it?

A. By having any cover on it. The lamp which is generally used with safety is the Davy safety lamp, or they are using now a great deal the incandescent lamp and electric light.

Q. Is it practicable to use an electric light that is wholly inclosed

in a glass tube in mills of this kind?

A. Yes, sir, the millers are preferring them. All the large mills

of Minneapolis are equipped with those.

Q. So that the companies insist upon such a provision in the policies so as to secure a light of that kind?

A. So as to secure a safe light, simply not an open light.

Q. You testified in the case of A. Backus, Jr., & Sons in regard to their planing mill, where the union depot proposes to go in front of their property?

A. Yes, sir.

Q. And you testified if the road was properly operated in front of their property it would not increase the fire risk?

A. It would not.

Q. You were not here in 1882 when the railroad was open through their yard at the foot of Eighteenth street?

A. No, sir.

483

Q. You know nothing about that? .

A. I was not living in this city at that time.

Q. Suppose a man has a lumber yard in this city on the lines of railroad, where he simply stores lumber on each side of the track, and a railroad is opened through there, a right of way is acquired, 60 or 100 feet from the yard on which a railroad is operated, would the companies increase the fire risk if it was

known that that railroad was to be properly operated?

A. They would not increase the fire risk, but if they saw that railroad-were in the habit of running their engines carelessly, they would increase the rate, and then if a fire occurred through negligence, they would pay the insured, and take subrogation of the railway company.

Q. As I understand, if a railroad is operated properly in the vicinity of a lumber yard, the companies do not regard it as an in-

crease in the risk?

A. Not if there is no emission of sparks. If there is any class of engines running backward and forward, whether a freight engine or passenger engine, and will emit sparks, they will increase the rate if they saw the ordinance was not carried out.

Q. As an expert, do you understand that engines can be and are

properly run?

484

A. They can be. They are run through the city of New York in that way, and they run through the city of Newburg that way, on the Hudson river.

Q. So there is no practical difficulty in operating a railroad so as

not to increase the fire risk?

A. There is none at all.

Mr. Baker: I desire to read the testimony of Mr. Beveridge given in the former trial of the Backus case:

Q. What is your business?

A. Inspector of buildings for insurance companies.

Q. How long have you been in the insurance business?

A. About 20 years.

Q. How long have you been inspecting property in Detroit?

A. Three years and a half.

Q. This case the respondents, Absalom Backus and the other persons interested, own a piece of property on River street. It is a brick planing mill and box factory. It is proposed by the Fort Street Union Depot Company to build an elevated road in that street, where the superstructure will carry the engines at about the height of the second story, or between the second and third stories, and his main building is situated about forty feet from the superstructure; that is, there are six feet in the street for the sidewalk, and there are about 33 or 34 feet beyond that. On one part of the property there is a brick building that is nearer to the street; I should think it was between two and three feet of the street line and from eight to ten feet from the superstructure, but that building has a solid wall, and has no windows in it. The gable end is solid from the roof to the ground. Along the street, between the main building, which is 40 feet from the superstructure, is an open shed. The fence along the street is an ordinary board fence about 12 feet high and a shanty roof to it, but it is all open on the inside, and that has windows in it. I show you a photograph of the property.

man familiar with this business, I desire to know whether or not the construction and operation of an elevated railroad along River street, as I have described, the road to be operated in compliance with the statutes and ordinances, with all the skill that is known to the art of operating a railroad at the present time, in regard to dampers and

spark-arresters and so on, being operated in that way, would the insurance companies charge any additional fire risk because of the construction and maintenance of such a railroad?

A. If operated in the manner in which you have described, so that sparks would not be emitted, there would be no increase in the risk.

Q. You have occasion to inspect a great deal of manufacing property and saw-mill property all over this part of the country?

A. I have inspected all of the manfacturing places in Wayne county.

Q. What do the companies take into consideration, as far as the

operation of the road is concerned?

A. In a city it is generally considered that the city ordinances will have such an effect upon the speed of the railway, and also on the emission of sparks, that they never increase the rates of insurance on buildings for an elevated railway, unless they see that the particular railway is breaking those ordinances and increasing the hazard from the emission of sparks.

Q. What is the practice of the companies in regard to claiming the benefit in their policies of the common-law liability of the rail-

road companies for neglect upon their part?

A. They have no clause in them, but in the standard policies used in Michigan, if there was any neglect on the part of the railway company, the railway company would be held liable.

Q. Do you take into consideration the liability of the railway

company in fixing the rates?

A. As a rule we do where it passes in front of their property.

Q. To state a case, if a railroad company were negligent 486 and burned up property upon which your companies had policies or risks, do the insurance companies look to the railway companies for damages?

A. The insurance companies, as a rule, would pay the insured company, and then take subrogation from the railroad companies.

Q. So that as the business is transacted, the insurance companies have an interest in fixing their rates and in transacting their business in the way in which the railroad is operated?

A. Yes, sir.

Q. And, as I understand you, if the railroad is operated properly, operated as near as it can be under the existing state of the railroad

art, there is no increase of fire risk?

A. There may be increased fire risk, but there is no increase to fire rates for the city if they put in the dampers in such manner, as there is no emission of sparks. They do not consider that sufficient hazard to increase the rate. If the railway is in the habit of breaking that rule, the general hazard would be such that they would doubtless increase the rates.

Cross-examination by Mr. Dickinson:

Q. Where do you live?

A. In Detroit.

Q. How long have you lived here?

A. Three years and a half.

Q. For whom do you adjust?
A. I adjust for nobody. I am inspector of buildings for the three Michigan companies, the Detroit Fire and Marine, the Michigan, and the Grand Rapids, and for such other parties as I am employed by.

Q. Have you ever inspected the Backus property?

A. Yes, sir. 487

Q. For what company?

A. For no particular company, simply at the call of one of the agents here, James A. Jones, on one occasion, and a second time at the request of Mr. Jones.

Q. Have you made an inspection of the property with reference

to the proposed new road?

A. No.

Q. Do you know the kind of business they do? A. Yes, sir.

Q. What is it? A. A planing mill and box factory.

Q. Do you consider making of boxes the principal business they carry on?

A. They do a large amount of planing of lumber.

Q. Do you call it a box factory; is the making of boxes onefiftieth part of their business?

A. I don't know, sir.

Q. Why do you call it a box factory?

A. That is a term we use in the insurance business; the same as we say a planing mill, and sash and blinds, and door factory.

Q. Do you know anything about the rates they charged Backus heretofore?

A. I think so.

Q. Do you know?

A. I am not certain.

Q. Do any of your companies insure Backus?

A. I don't know what parties the companies insure.

Q. How did you come to interest yourself to find out what they charged him?

A. I simply make the inspection for those companies. 488 Q. Did the people for whom you made the inspection insure them?

A. The first time I was called by Mr. Jones I think he did insure them.

Q. You don't know.

A. I simply have the belief that he did.

Q. Did you inspect the lumber yard that Mr. Backus has below there?

A. I went through the lumber yard.

O. You testified that there would be no increased rates there?

A. This was the first time I have been upon the stand.

Q. You did not think the running of the railroad through their lumber yard down there would increase the rates?

A. I have never testified in this case before.

Q. I am asking you whether in your opinion the rates for running through the lumber yard would be increased, if you know?

Mr. Baker: I object to that, it not being the property involved in this case.

Mr. Dickinson: I am testing the accuracy of the witness; I insist upon it.

Q. Would you think that the running of a railroad through a

lumber vard would increase the rate?

A. I do not think that it would increase the rate if it were run according to the ordinance. If it is run according to the ordinance, so there is no emission of sparks, it would not increase the rate.

Q. Did you ever inspect their lumber yard?

A. Yes, sir.

Q. For purposes of insurance?

A. Yes, sir.

489 Q. Did you recommend any increase of rates because of the railroad?

A. No. sir.

Q. How did it come that they trebled the rates as soon as the railroad went through?

Mr. BAKER: I object to that.

Q. Do you know the rates of it?

A. I am not certain of the rates. I can telephone and find out.

Q. Did they increase the rates by running of the railroad through there?

A. I never did.

Q. Did the insurance company?

A. I am sure I don't know.

Q. You do not do the insuring?

A. No.

Q. The insurance companies charge what they please, and refuse to insure?

A. They refuse to insure when they do not wish the risk, the insurance is not compulsory.

Q. It is not compulsory to take your opinion?

A. Not at all.

Q. You have testified as to the situation of the building; will you please tell the jury what is the situation of the building with regard to this new railroad?

A. As described by Mr. Baker, I judge that it is to be about 39 feet distance from the elevated road; the elevated road is to be on

a level with the second or third story windows, from his description.

O. Do you know anything about where the machinery in that building is, the dust and sawdust room? 490 A. The dust and sawdust room would be near the boiler

and engine room.

Q. Do you consider that that adds to the danger of the situation of this building, that that is on the side of the new railroad?

A. Not if it is a good safe dust-room.

Q. Do you know that dust-rooms like this in planing mills are very inflammable?

A. They are supposed to be.

Q. They will ignite almost as quickly as gas?

A. If there is much fine dust, they have been known to ignite in

that way.

Q. Suppose that is now situated away from the Michigan Central road and is nearest to the new railroad, would that add to the increased fire risk?

A. If it is from 36 to 39 feet, as described by Mr. Baker, it will not.

Q. Did you inspect it and know where the dust-room is, without regard to Mr. Baker?

A. I know where the dust-room is.

Q. Where is it?

A. Near the boiler and engine room. Q. Is it anywhere near the new road?

A. I don't know where the new road is going to be, except from the description given me.

Q. How near is the dust-room to River street?

A. I don't know.

Q. If the dust-room is situated near River street, would you think that the new road would add something to the fire risk?

A. If the sparks would be emitted the whole time, it would add

to the fire risk.

491 Q. And it could not be free from it unless it could be transferred to another part of the building, could it?

A. What could not be?

Q. The large fire risk from the dust-room.

A. The large fire risk from the dust-room will be no greater when

the elevated road is built than it is now.

Q. No added fire risk from having a new railroad, different from what it is now, come along there within 15 or 20 feet from the dustroom?

A. If it is 20 feet from the dust-room and there is no emission of sparks, there will be no increased hazard.

Q. And yet you say the dust-room in these manufactories is almost as inflammable as gas?

A. It is, under certain conditions.

Q. What are those conditions?

A. A high rate of temperature and very large surplusage of very fine dust.

Q. Is that ordinary in one of these machines that you find working, the fine dust?

. A. Yes, sir.

Q. A large amount?

A. Yes, sir.

492

Q. Suppose the dust-room is but six feet away from the new line

of road, will that add anything to the fire risk?

A. The proximity of the dust-room will not increase the rate, provided the railway is run, as I have said two or three times, without the emission of sparks. If there is going to be any emission of sparks on this elevated road, or any other railroad, it would tend to increase the rates.

Q. Do you know of any railroads on which sparks are not emitted?

A. Yes, sir. Q. Where?

A. The West Shore railroad running through Newburgh.

Q. I am talking of Detroit, Michigan; do you know of any rail-road that does not emit sparks in entering this city?

A. I notice they generally shut down.

Q. Do you know of one?

A. In going through the city, I notice they do not emit sparks.

Q. Which one?

A. All of them.

Q. You are as positive about that as of anything else you have testified to?

A. Simply from my own observation; my own observation shows me that.

Q. But you think the fire risk would be greater, ordinarily, along-side of a railroad, if the dust-room is 6 feet, than if it were 36 or 40?

A. Not if they did not emit sparks.

Q. If they did emit sparks?

- A. If they did emit sparks, of course that would be an additional hazard.
- Q. It would be more additional hazard if it were 6 feet instead of 36 feet, as stated by Mr. Baker?

A. It would.

- Q. Could that hazard be avoided if now the dust-room was put as far as possible away from where it is now situated, but could not be removed to any other part of the building because the railroad is on that side?
- A. If there was only going to be about six feet between this dustroom and this railway, and there was going to be an emission of sparks, it would be admissible to change the location of the dustroom.

493 Redirect:

Q. Are these dust-rooms open from the outside, if they are properly constructed?

A. As a rule, no, sir.

Q. The danger, as I understand you, is from the high temperature, of their being very warm, and a very large amount of fine dust.

A. Yes, sir; all dusts are inflammable and explosive.

Q. It is usual in any well-regulated manufactory to have an inclosed dust-room?

A. Yes, sir.

Recross:

Q. You are accustomed to inspecting lumber in mills, are you not?

A. Yes, sir.

Q. Is the rate higher or lower as the lumber is piled, remote or

near the engines and boilers?

A. If they have no clear space from the lumber, it is greater; if they have no clear space from the lumber and the mill, it is greater than if they had a clear space.

Q. How big a space?

A. If they have 200 feet space, it is less than if they have 150, and if they have 150, it is less than if they have 100.

Q. Do not the rates change as the lumber is piled near and far from the mill?

A. They do.

Mr. Baker: Were you here in 1882, when the railroad was put through their lumber yard?

A. No

Q. You had nothing to do with the rates that were fixed then?

494 A. No.

Q. You did not come here until three years and a half ago?

A. No, sir.

Mr. Baker then read the petition to condemn lands as follows:

"STATE OF MICHIGAN:

To the circuit cour for the county of Wayne:

Your petitioner, 'he Fort Street Union Depot Company, respect-

fully represents:

1. That your petitioner is a railroad corporation organized under an act entitled, "An act to authorize the incorporation of companies for the construction of union railroad depots and stations, with the necessary connecting tracks, and the management of the same," approved June 9, 1881, and the amendments thereto; that your petitioner heretofore to wit, on the 24th day of August, 1889, was duly incorporated by the filing of its articles of association, and annexed affidavit, in the office of the secretary of state, as required by said act.

2. That the capital stock of your petitioner has been in good faith subscribed as required by said act to organize such company, that is to say, the capital stock of your petitioner is fixed by said articles of association at the sum of one million dollars, which was not less than the estimated and probable cost of your petitioner's proposed station ground, depot buildings and railroad tracks proposed to be

289

laid; that more than 50 per cent. of said capital stock was subscribed upon said articles of association, and 10 per cent. was in good faith in cash paid in to the directors named in said articles, and an affidavit was made and attached to said articles by William W. Crapo and George Coppell, two of said directors, showing that said amount had been subscribed and 10 per cent. in cash paid in as aforesaid.

3. That your petitioner has surveyed its depot grounds and the route of its proposed tracks in the county of Wayne and made a map and survey thereof, by which said depot grounds and route are designated, and that it has located the same according to such survey and filed a certificate thereof, indorsed on such map and survey and signed by a majority of the directors of said company, in the register's office of said county of Wayne, to wit, on the 12th day of November, 1889; that before filing said map and survey, to wit, on the 22d day of October, 1889, your petitioner submitted the same to the State railroad crossing board, consisting of the commissioner of railroads, attorney general and secretary of state, for approval, in compliance with section seven of the general railroad law of this State, as amended by act No. 236 of the Public Acts of 1887, page 294; that thereupon such proceedings were had that afterwards, to wit, on the 8th day of November, 1889, said map and survey was duly approved by said board, and a certificate of such approval indorsed thereon, and said map and survey so certified and approved, now remains of record in the said register's office for the county of Wayne, and to which record reference is hereby made.

4. That the route of the proposed tracks of your petitioner as shown by said map and survey, cross the railroad tracks of the Michigan Central Railroad Company on and within the limits of River street in the city of Detroit, at the point known as the River Street crossing of said Michigan Central railroad; that a ten days' notice was given by the State railroad crossing board to Henry B.

Ledyard, the president and general manager of said Michigan

496 Central Railroad Company, of the time when and the place
where the board would consider the question of approving
said map and survey; that said Michigan Central Railroad Com-

said map and survey; that said Michigan Central Railroad Company appeared before said board and was heard in opposition to such approval; that your petitioner requested said board to approve of said map and survey unconditionally, but said Michigan Central Railroad Company objected to any approval of said map and survey, and further insisted that if approved, it should be on condition that an overhead passageway for teams and travelers on foot should be constructed at said River Street crossing, in connection with the superstructure proposed to be constructed over said Michigan Central railroad by your petitioner; that after fully hearing both parties, the said board granted and entered upon the record of its proceedings the following order:

Copy of Order Approving Map.

STATE OF MICHIGAN:

Before the board of railroad crossings.

In Re the Approval of the Map of the Fort Street Union Depor COMPANY's Proposed Route in the City of Detroit.

DETROIT, MICHIGAN, November 8, 1889.

At a meeting of the board of railroad crossings, held at the Russell

house, pursuant to adjournment.

Present: Hon. John T. Rich, commissioner of railroads; Hon. Gilbert R. Osmun, secretary of state; Hon. S. V. R. Trowbridge, attorney general, members composing the board.

In the matter of the application of the Fort Street Union Depot Company for the approval of the map of its proposed line of railroad tracks, between Twelfth and Third streets, in the city of

Detroit, county of Wayne, with a crossing of the several tracks of the Michigan Central railroad, in Woodbridge 497 street, near the intersection of Eleventh street, said application now coming up for further hearing of the board, Mr. James F. Joy and Fred. A. Baker, duly appointed and authorized in such behalf, appeared as attorneys for the said Fort Street Union Depot Company, and Mr. Ashley Pond and Henry Russel as attorneys for and

on behalf of the said Michigan Central Railroad Company.

Whereupon, the board having listened to the arguments of counsel, and to the statement of the engineers employed by each of the said parties in interest respectively, and to the statements of all other parties appearing before the board and desiring to be heard, and being otherwise fully advised and informed, and having first considered all and singular the premises, on motion of Mr. Osmun, seconded by Mr. Trowbridge, the said map and the said line of railroad as designated and located thereon were duly approved by the board, and the certificate of such approval over the proper signatures of the members of the board duly indorsed on said map.

And it was further determined and ordered by the board with regard to the crossing of the tracks of the Michigan Central railroad in Woodbridge street near the intersection of Eleventh, and that the tracks of the said Fort Street Union Depot Company shall go above those of the Michigan Central railroad at an elevation of at least 18 feet in the clear between the upper surface of the head of the rails in the Michigan Central tracks and the under surface of the girders in the superstructure of the said union depot company's bridge.

And the said superstructure shall be so constructed on River 498 street as to provide a passageway for teams and foot travelers, and in accordance with the plans and specifications to be first submitted to and approved by the commissioner of railroads.

The cost of the part of the superstructure for the passage of teams and foot travelers, and of the approaches thereto, shall be borne by

the two companies in interest, in equal proportions, share and share alike.

JOHN T. RICH, Chairman of Board.

Attest: W. C. RANSOM, Clerk of the Board."

That the route of the proposed tracks of your petitioner, as shown by said map and survey, lies upon and along River street in the said city of Detroit, from a point at or near Twelfth street to a point at or near Eighth street, and the terms and conditions under which your petitioner is to construct its said tracks upon and along said River street, have been agreed upon between the common council of the city of Detroit and your petitioner, as shown by the following ordinance, adopted by the common council and accepted by your petitioner:

Copy of Ordinance.

"Whereas, the Fort Street Union Depot Company is a corporation under the laws of this State, for the construction of a union depot on the southwest corner of Third street and Fort street west, in this city, and said company, for the purpose of furnishing access to said union depot, propose to build an elevated railroad in, upon

and along River street, from the west side of the Thompson 499 farm to the east line of lot number ten (10) of the Labrosse

farm; thence northeasterly to a point south of Forth street, north of Congress street, and west of the west line of Seventh street; thence across Seventh, Sixth, Fifth and Fourth streets, between Fort and Congress streets; and

Whereas, the act under which said depot company is organized provides that the terms and conditions under which said elevated railroad may be constructed in any street shall be agreed upon be-

tween the company and the common council, and,

Whereas, the construction of said road may render it necessary to vacate Fourth, Fifth, Sixth or Seventh streets, between Fort and Congress streets, or to change the grade of Sixth or Seventh streets, therefore,

Section 1. It is ordained that the terms and conditions for the construction of said railroad along River street shall be as follows:

That is to say, the superstructure of said elevated railroad shall be supported by iron posts not more than 15 inches square or in diameter; that said posts shall be set along the line of the curbing now in said highway, and outside of the railroad and curbing, so that the superstructure will span the entire roadway or paved portion of said highway; said posts shall be not less than 30 feet apart along said curb-lines, except in crossing the Michigan Central railroad, where they shall be so placed as to be most convenient for both roads; said posts shall rest wholly upon solid foundations of masonry, wholly beneath the surface of the street, and such posts shall be of such length that at no point on the line of the said road shall the space between the surface of said River street, or any street

eading into said River street, and the superstructure, be less than
13 feet in the clear; and no posts shall be placed within or
500 between the curb-lines of any street leading into or intersecting said River street, or within the lines of the sidewalk upon

such intersecting streets.

In case said roadway shall be constructed across and over any of the said Fourth, Fifth, Sixth or Seventh streets, the superstructure shall be supported either by stone walls, erected on the street lines, or by iron posts not more than 15 inches square, or in diameter, which shall be set so as to span the entire roadway of said streets, and none of which shall be set between the curb-lines of either of said streets, or within the sidewalk lines thereon; the said posts shall rest upon solid foundations of masonry wholly beneath the surface of said streets; and at no point on either of said streets, provided the roadway shall be constructed over either of said streets, shall the space between the surface of the street and the superstructure be less than 13 feet clear, under said structure; and

The superstructure shall consist of iron and steel girders and ties, having an aggregate height of five feet, substantially as shown on the 'cross-section' thereof, filed by said company with the city clerk, with a map showing the route of said railroad along said River street and the location of the posts for the support, and which said cross-section and map are made a part of this ordinance.

Suitable iron plans or shields to catch the ashes and refuse from locomotives shall be constructed upon the tracks of said elevated railroad on and along River street, and over any other street above which said roadway shall be constructed. And the said company shall cause to be properly lighted to the satisfaction of the board of public works the said River street, under said superstructure, and any street crossing over which said roadway may be constructed.

501 Sec. 2. The said company shall keep the posts and superstructure of said elevated railroad in good order and repair, and in constructing the same shall obstruct the streets for a reasonable time only.

SEC. 3. In case the common council should, in its discretion, at any time hereafter resolve and determine to vacate the said Fourth, Fifth, Sixth and Seventh streets, or either or any of them, and take the necessary steps and proceedings to vacate the said streets, or either of them, and the same or either of them should be vacated, the said Fort Street Union Depot Company shall pay all the costs and expenses of such proceedings, and shall pay all damages which may be awarded in said proceedings to any person or persons by reason of such vacation.

Sec. 4. In case the said roadway should be constructed by said company over the said Fourth, Fifth, Sixth or Seventh streets, or over either of said streets, at a height leaving a space less than 13 feet in the clear between the present surface of such street and the superstructure of said roadway, and the common council should, in its discretion, at any time hereafter, resolve and determine to change the grade of either or any of said streets, and the same be

changed, the said Fort Street Union Depot Company hereby agree to pay all the costs and expenses of such change and alteration of grade, and to pay all damages that may be awarded to any person or persons by reason of change of grade, and fully to indemnify the city against any and all claims, awards or judgments that may be recovered against the city by reason of such change of grade.

SEC. 5. The said company shall acquire by purchase or condemnation, from the adjoining property-owners, the right to build said elevated railroad in said street, as required by the

constitution and laws of this State.

Sec. 6. In consideration of the police and fire protection, and in lieu of local taxes, the said company shall, and it hereby agrees to pay to the city treasurer, on or before the first day of July in each year, two and one-half per cent. of the gross earnings of said company, as determined by the State railroad commissioner and auditor general, in pursuance of sections 19, 20 and 21 of the union depot act of 1881. Provided, that if by any change in the constitution or laws of this State, the company shall hereafter be required to pay local taxes, then the company is to be credited upon the percentage herein stipulated, with the amount of local

taxes it may be required to pay.

SEC. 7. The said company shall within thirty (30) days after the passage of this ordinance file a written acceptance of the terms and conditions thereof with the city clerk, and shall procure from the owner or owners thereof a deed to the city of Detroit, dedicating to the public use as a street all that parcel of land in the city of Detroit, in the county of Wayne and State of Michigan, from River street to the channel bank of the Detroit river, including between the lines of Twelfth street extended, except the part thereof owned by the Michigan Central Railway Company, and the same is to be kept open and clear for public use, and shall cause said deed to be filed with the controller of the city; and,

Said company shall execute and deliver to the city of Detroit a good and sufficient bond, in the penal sum of \$500,000, to be approved by the common council, conditioned for the faithful perform-

ance of the terms and conditions of this ordinance, and to fully indemnify and save harmless the city of Detroit, from any and all claims for damages for which said city may be

made or become liable to pay, by reason of the construction, maintenance or operation of said railroad or superstructure. This ordinance shall take effect upon the filing of said acceptance, the de-

livery of said deed and the approval of said bond.'

6. That heretofore, to wit: on the 14th and 15th days of June, 1890, the Michigan Central Railroad Company by Henry Russel, its duly authorized agent and general attorney, and your petitioner by William W. Crapo, its duly authorized agent and president, entered into a contract in writing as shown by the following memoranda:

Copy of Letter from Russel to Crapo.

DETROIT, June 14, 1890.

W. W. Crapo, Esq., pres. Fort Street Union Depot Company, Russell house, Detroit, Mich.

DEAR SIR: In compliance with your request, I herewith submit to you a memorandum of this company's proposition in respect to the construction of your road through Woodbridge street, in the city of Detroit, across this company's tracks and in front of its premises, as stated verbally in our conference at my office this morning.

First. Your company and this company to comply with the order of the State railway crossing board and of the commissioner of railroads in respect to the crossing of this company's track and the construction of a viaduct for teams and foot travelers in connection with your structure, each company to bear one-half of the cost of construction and maintenance of the viaduct for teams and foot travelers and its approaches; and this company will furnish, without charge, the use of its private property south of Woodbridge

street necessary for the construction of a viaduct, and its approaches in accordances with said orders, and will waive all claim for damages arising to this company by reason of the construction of such viaduct and its approaches, and of your company's elevated structure within the limits of said approaches

upon, and in front of this company's property.

Second. This company will give to your company the right to cross a triangular piece of this company's private property overhead on the southeast corner of Woodbridge and Twelfth streets, to enable your company to swing out onto Woodbridge street. I am not informed as to the exact measurements of the property which you require, but I understand it is a very small piece. This being so, we will be able readily to agree what compensation, if any, your company shall pay for this right. It would probably, in all event, be a small sum.

Third. As to the abutting damages arising to this company from the construction of your road upon the elevated structure upon and along Woodbridge street in front of this company's property, a distance of about 2,100 feet, as I am at present advised, we will, in the first place, deduct 1,300 feet covered by the viaduct and the approaches, in respect to which this company, as above mentioned, agrees to waive any claim of damages, and for the remaining 800 feet of property fronting on River street, this company will agree that your company may pursue either one of the following three methods:

1. You may proceed at once with the construction of your road upon an agreement that, at the end of either one or two years, as you may elect, allowing sufficient time for your company to complete its road and begin operation, and then from the actual knowledge of the situation, your company is to pay such damages as we

may, by agreement, determine to be fair to this company, or, failing such agreement, as may be determined by three arbi-505 trators, to be chosen in the usual manner; or,

2. Your company may proceed at once by condemnation proceedings at law to have a commission appointed to determine what the damages of this company are in respect to said 800 feet of frontal on River street, and your company pay the damages determined

by such commission; or,

3. Your company submit a fair and reasonable offer of what you are willing to pay for this right of constructing and maintaining your road and operating your trains, etc., upon River street in front of the said 800 feet of this company's property, and upon receiving such offer from you I will at once lay the same before the executive committee of this company and advise you promptly as to their action.

In the absence of the president of this company, I am willing, exercising due regard to the rights of this company, to go to the full limit of my authority and discretion in order to reach an agreement with your company so as not to obstruct or delay the construction of your road, and in submitting the foregoing proposition I

have done so.

HENRY RUSSEL, Gen'l Att'y. Yours truly,

P. S.—It must be distinctly understood that the question of the amount of compensation, which this company may be entitled to receive by reason of the construction and operation of your elevated road in front of said 800 feet of its property on River street, is not in any way to be affected by this company's consent to the construction without compensation of your structure and said viaduct and approaches in front of the rest of its property.

H. R.

506

Copy of Letter from Crapo to Russel.

SAGINAW, MICH., June 16, 1890.

Henry Russel, Esq., general attorney Mich. Cent. Railroad Co., Detroit. Mich.

DEAR SIR: The propositions and offerings named in your letter to me of June 14, are hereby accepted in behalf of the Fort Street

Union Depot Company.

The railroad bridge over your tracks, and also the viaduct, in their general character, I understand, are to be the same which are embraced in the plans which were considered by us at our last interview, subject to such modifications in details as shall be acceptable to both parties and approved by the railroad commissioner.

In reference to the damages arising to your company I understand all claims are waived on that portion of Woodbridge or River street extending between the two approaches of the viaduct, estimated by you at 1,300 feet, but the exact distance is to be determined by actual measurements, on adoption of the plan for the work.

Yours truly,

It is the preference of this company to determine as soon as practicable the amount of damages which it may be required to pay, and as I am assured by you that condemnation proceedings at law, and the appointment of a commission, will not be regarded as a hostile or litigious method of reaching the question in dispute, I shall direct the attorney of the Fort Street Company to proceed as expeditiously as practicable to take the necessary steps to this end.

The two companies having reached an agreement upon the main points which have been at issue, I am confident that the construction will be attended by the exercise on both sides of such accommodations as will secure to you as little inconvenience, and to us as little delay as the character of the work will permit.

WM. W. CRAPO, President Fort Street Union Depot Company.

7. That afterwards, to wit, on the 15th day of July, 1890, the Michigan Central Railroad Company and your petitioner agreed upon a plan for the construction of a viaduct or elevated railroad for the use of your petitioner and of passageways for teams and foot travelers, over the tracks of said Michigan Central Railroad at said River Street crossing, with this exception, that the Michigan Central Railroad Company preferred and insisted that abutments should be placed across said River street on each side of said crossing so as to close said River street underneath the viaduct or elevated railroad of your petitioner, thereby compelling all teams and foot travelers to use said overhead passageways designed for their use, and conferring upon said Michigan Central Railroad Company the entire and unobstructed use and possession of said street crossing; and your petitioner preferred and insisted that said abutments should not be built, and that the street should be left open under your petitioner's viaduct or elevated railroad, so that the drivers of teams and vehicles, and foot travelers, could pass along said street and cross said Michigan Central Railroad tracks on the street level, and underneath the viaduct or elevated railroad, or pass over said tracks on the passageways for teams and foot travelers, as they might at the time of passing prefer.

8. That afterwards, to wit, on said 15th day of July, 1890, your petitioner, as required by order of the State railroad crossing board approving said map and survey, submitted a plan for the construction of said overhead crossings to the Hon. John T. Rich, commissioner of railroads, for his approval; that notice was given to the Michigan Central Railroad Company of the application for the approval of said plan; that thereupon the Michigan Central Railroad Company also submitted a plan therefor; that the only difference between the two plans was, that one provided for closing the street with abutments, and the other left the street open; that both companies were fully heard by the commissioner upon the merits of said plans, and after such hearing the said commissioner did approve of the plan so submitted by your

petitioner, and indorsed his approval thereon and filed the same, so indorsed, in the office of the commissioner of railroads, and he also delivered a duplicate original of said plan and indorsement to your petitioner, and the same is now in its possession, and is made a part of this petition.

A copy of said plan as so approved is herewith filed and served.

9. That your petitioner has also prepared and adopted a plan for the construction of its proposed viaduct or elevated railroad in said River street from a point near Twelfth street to a point near Eighth street, and said plan at said River Street crossing conforms with the crossing line so approved by the railroad commissioner. Said plan is also made a part of this petition, and a copy thereof is herewith filed and served.

10. That the Michigan Central Railroad Company is the owner and in possession of all the property on the south side of River street between Third and Fourth streets, and extending from

509 River street to the channel bank of Detroit river, except the westerly one hundred and fifty feet of the Woodbridge farm, and the easterly 11 feet of the Longnon farm, and the title to which strip of 160 feet in width, is - the Detroit, Lansing & Northern Railroad Company, but subject to the rights of the Michigan Central Railroad Company, which is in possession of said strip under said contracts and agreements existing between the two companies, and by virtue of which, as your orator has been informed and believes, and charges the truth to be, the said Michigan Central Railroad Company has an equitable right to acquire said title.

The Michigan Central Railroad Company is also the owner and in possession of all the property on the north side of said River street and extending westerly from Tenth street to the lot or parcel of land owned by Mary Specht, and adjoining the tracks of the Michigan Central railroad, as the same is shown by the plan for the construction of said viaduct or elevated railroad hereinbefore mentioned, and which property of the Michigan Central Railroad Company has a frontage on the north side of said River street of

520 feet more or less.

The Michigan Central Railroad Company is also the owner and in possession of a parcel of land on the north side of said River street and lying between the property of said Mary Specht and the property of A. Backus, Jr., as shown on said plan, and which parcel has a frontage on River street of 17 feet more or less.

11. That your petitioner desires to build said viaduct or elevated railroad and to construct the same according to the terms and conditions, and in full compliance with the ordinance agreed upon between the common council of the city of Detroit and your

510 petitioner, as aforesaid, the order of the State railroad crossing board, the crossing plan approved by the railroad commissioner, and the general plan designed and adopted by your petitioner as aforesaid; and your petitioner also desires to comply with, and to fully execute and perform its contract with the Michigan Central Railroad Company, as contained and expressed in the letters aforesaid, and it hereby offers and agrees to join with the Michigan Central Railroad Company, in the construction of said passageways for teams and foot travelers, and the approaches thereto,

and pay its half of the cost and expense thereof.

12. That your petitioner seeks to acquire under this petition, in the county of Wayne, and from the Michigan Central Railroad Company, the following real estate, property and franchises, that is to say:

I

The right of way to construct and maintain said viaduct over the triangular piece of land situated at the southeast corner of River street and Twelfth street, the posts to be set as indicated on the plan adopted by your petitioner, and the superstructure to be at least fourteen feet in the clear above the tracks of the Michigan Central Railroad Company.

II.

The right of way to construct and maintain said viaduct on River street, in accordance with said ordinance, and the plan adopted by your petitioner, in front of the property of the Michigan Central

Railroad Company, situated on the south side of River street, and extending from the east line of Twelfth street to the westerly end of the westerly approach to said passageway for

westerly end of the westerly approach to said passageway for teams, and also extending from the easterly end of the easterly approach to said passageway for teams to the point where said viaduet will pass wholly out of said River street, the intention being to cover and describe the frontage of the Michigan Central Railroad Company on River street, mentioned in the letter of Russel to Crapo as eight hundred (800) feet, as distinguished from that part of the frontage within the limits of the approaches to said passageway for teams, and mentioned in the letter of Russel to Crapo, and the letter of Crapo to Russel, as thirteen hundred (1,300) feet.

III.

The right of way to construct and maintain said viaduct on River street, in front of and upon the property of the Michigan Central Railroad Company, and within the limits of the approaches to passageway for teams, in accordance with said ordinance, the said order of the State railroad crossing board, and the plan for said crossing approved by the railroad commissioner, coupled with the performance by the Michigan Central Railroad Company of all the duties, liabilities, obligations and promises, which it is now legally bound to perform, whatever the same may be, under the order made by said board, the plan approved by said commissioner, and the contract of agreement between the two companies expressed in said letters.

13. That all of the real estate, property and franchises set forth and described in the preceding paragraph of this petition are required by your petitioner for the purposes of its incorporation, and the taking thereof is necessary for the public use;

that the union depot and station grounds proposed by your

petitioner, and the proposed railroad tracks connecting therewith, are a necessary public improvement, and public necessity requires that all of said real estate, property and franchises, and all of the estate, title and interest of the Michigan Central Railroad Co. therein, as herein described and set forth, should be taken for said

improvement, and for the use and benefit of the public.

14. That your petitioner has not been able to acquire title to the said real estate, property and franchises, and that the reason of such inability is this, that your petitioner has been unable to agree with the Michigan Central Railroad Co. for the purchase thereof; nor has your petitioner been able to agree with the Michigan Central Railroad Co. upon the question whether the contract and agreement between the two companies, as expressed in said letters, is still a valid and binding contract, and one the Michigan Central Railroad Co. is legally bound to perform.

15. That your petitioner has acquired from the Detroit, Lansing & Northern Railroad Co. the right to construct and maintain said viaduct and passageway for teams and foot travelers in front of the strip of land one hundred and sixty (160) feet in width, the title to which, as hereinbefore stated, is in said company, but said right has been so acquired subject to all of the legal and equitable rights of the Michigan Central Railroad Company in and to said strip of land.

16. That the Michigan Central Railroad Company claims and pretends that the contract between it and your petitioner, contained and expressed in said letters, is not now a binding contract.

because the plans mentioned in the letter of Crapo to Russel provided for closing River street with stone abutments on each side of the crossing, and that your petitioner has therefore violated the contract by securing the approval of a plan by the railroad commissioner, which omits said abutments and leaves the street open.

In answer to said claim and pretense, your petitioner submits and

shows:

1. That your petitioner has been informed and believes and charges the truth to be that the plans mentioned in said letter as having been considered by said Russel and Crapo, did not provide for stone or other abutments, which would close said street at said crossing.

2. That said Russel and said Crapo both understood and believed that said plans so considered by them, did not provide for closing

said street with abutments.

The understanding and belief of said Russel is alleged upon in-

formation and belief.

3. That if the contract, as expressed in said letters, and as understood by said Russel and Crapo, does provide for abutments, the omission thereof on the plan so adopted and approved, is merely a modification in details within the meaning of said contract, and as to which, in any event, the decision of the railroad commissioner, in approving said plan under the power reserved to him by the order of State railroad crossing board, approving your petitioner's

map and survey, is conclusive and final, and binding upon both companies.

Prayer.

Your petitioner prays that an order may be granted by the court appointing three disinterested and competent freeholders as

commissioners, under the constitution and laws of this State to ascertain and determine the public necessity for taking said real estate, property and franchises for the purposes of your petitioner and the public use and benefit, and to appraise and determine the damages or compensation to be allowed to the Michigar Central Railroad Company as the owner of, or party interested in the real estate, property and franchises so proposed to be taken.

FRED. A. BAKER, Attorney for Petitioner.

STATE OF MICHIGAN, County of Wayne, \$88:

On this 20th day of September, 1890, before me, a notary public in and for said county, personally appeared Fred. A Baker, the person who signed the above and foregoing petition, and made outh that he is the attorney for said petitioner, and signed said petition on its behalf; that he has read said petition and knows the contents thereof, and the same are true of his own knowledge, except the matters and things therein stated to be on information and belief, and as to those he believes the same to be true.

WALTER BARLOW, Notary Public, Wayne County, Michigan.

To the Michigan Central R. R. Co.:

You will please take notice that on Monday, the 6th day of October, 1890, at the court-room in the city hall, in the city of Detroit at the opening of court on that day, or as soon thereafter as counsel can be heard, a petition, of which the within and foregoing is a true

515 Copy, will be presented to the circuit court for the county of Wayne, and at which time and place you are required to show cause, if any you have, against the prayer of said petition.

Detroit, Sept. 20, 1890.

FRED. A. BAKER, Attorney for Petitioner.

Mr. Dickinson: You remember, when Mr. Joy was on the stand, you agreed to bring in the agreement between the union depot company and the Michigan Central?

Mr. Baker: The letters that I read in that petition constitute the written agreement between the two companies.

Mr. Baker then read the answer of the Michigan Central as follows:

In the Circuit Court for the County of Wayne.

In the Matter of the Petition of the Fort Street Union Depot Company to Condemn, as Against the Michigan Central Railroad Company, the Right to Construct its Tracks over River Street from Twelfth Street to Eighth Street, and over a Triangular Piece of Ground Belonging to the said Michigan Central Company at the Corner of Twelfth and River Streets.

The said Michigan Central Railroad Company answering said petition:

First. Denies each and every of the allegations in said petition

contained, except as hereinafter otherwise appears.

Shows and says, with reference to the alleged agreement between said Fort Street Union Depot Company and this respondent, that subsequently to the making of the order by said State railroad crossing board, as set out in said petition, the commissioner of railroads of said State made an order, of which the following is a copy:

516 "STATE OF MICHIGAN:

517

" OFFICE OF THE COMMISSIONER OF RAILROADS.

"To the Fort Street Union Depot Company and the Michigan Central Railroad Company:

"Whereas, in the judgment of the undersigned commissioner of railroads in and for the said State of Michigan as aforesaid, the construction of the proposed viaduct of the said Fort Street Union Depot Company along the line of River street, in the city of Detroit, in the interest of the public safety, and that of the employes on your respective roads, will necessitate the construction of an overhead passageway for the use of teams and footmen at the crossing of the said Michigan Central tracks in said River street near Tenth, therefore, by virtue of the authority in me vested, as commissioner of railroads as aforesaid, by the provisions of section 17 of act No. 79 of the Session Laws of 1873, and the several acts amendatory thereof, it is hereby ordered and directed that in the construction of the said Fort Street union depot viaduct along the line of River street, as proposed by the said company, the posts or supports of the said viaduct east of the Michigan Central tracks, upon the south side of said viaduct, shall be set so as to conform in alignment with those upon the south side of the viaduct and west of the said Michigan Central tracks.

"There shall be constructed upon the south side of said viaduct over the tracks of the said Michigan Central railroad a passageway for teams, to be not less than twenty-four feet in width, with the necessary approaches to the same, of not exceeding four per cent. grade, and the posts or supports of the said viaduct to be so set as to afford safe and convenient access from the street under the via-

duct to said approaches at either end of the same.

"There shall also be provided on the north side of said viaduct, a sidewalk for the use of footmen over the tracks of

the said Central railroad, to be reached by safe and convenient stairways from either side of tracks below. And such sidewalks shall be of such width as the ordinances of the city of Detroit shall require, and shall also be provided with safe and sufficient railings to insure the safety of people against falling from said sidewalks when passing along the same.

"The plans for the said viaduct, with the said passageways hereby ordered to be erected, will be submitted to the commissioner of railroads for his approval before the same shall be adopted, and the structures put in course of construction in accordance therewith.

[SEAL.] "Given under my hand and the scal of the department

at Lansing, this 30th day of April, A. D. 1890.

"JOHN T. RICH, "Commissioner of Railroads."

And this respondent is advised and submits, that the terms of the said order necessarily contemplated a change of grade of said River street, at the point where it crosses the tracks of this respondent, and required the construction of an overhead passageway for teams and footmen, so as to avoid all further use whatever of the dangerous grade crossing at that point; and this respondent shows that the negotiation between the said union depot company and this respondent, resulting in the letter, in said petition set forth, from Henry Russel to said W. W. Crapo, and the reply of the said Crapo thereto, were had in contemplation of the terms of said order, and that the plan referred to in the letter of said Crapo to said Rus-

sel, showed abutments across said River street; and that by the said agreement, as witnessed by the said correspondence, and as understood by this removable to an armonic of the said agreement, as witnessed by the said correspondence, and as understood by this removable to an armonic of the said agreement.

and as understood by this respondent and by said Russel, abutments were to be constructed across said River street, on either side of the tracks of this respondent, so as to avoid the use of said street at grade; and this respondent shows and avers that the subsequent application by said Fort Street Union Depot Company to the commissioner of railroads, for the approval of plans omitting said abutments and permitting the further use of said street at grade, and the approval of said plans by said commissioner of railroads, were in disregard of said agreement, and that the said agreement thereupon ceased to be binding upon this respondent; and this respondent is advised and submits that this court has no jurisdiction in this proceeding, to entertain and determine the controversy that has thus arisen between said Fort Street Union Depot Company and this respondent, as to whether or not said agreement is binding upon this respondent.

And this respondent is advised, alleges and submits, that it is, in this proceeding, entitled to litigate the rights of the said Fort Street Union Depot Company, to entertain this proceeding to condemn the property of this respondent in like manner and to the same extent as if said alleged agreement had never been made; but in case it is conceded or decided by this court that said alleged agreement is not binding upon this respondent, and that this respondent is therefore entitled to have its damages and compensation for the construction

of the road of the said Fort Street Union Depot Company along River street assessed in like manner and to the same extent as if said alleged agreement had never been made, this respondent hereby waives any and all objections to the maintenance of this pro-519 ceeding by said Fort Street Union Depot Company, and con-

sents that the only question to be tried herein shall be the question of the amount of damages to be awarded to this respondent.

THE MICHIGAN CENTRAL RAILROAD

COMPANY, By H. B. LEDYARD, President.

HENRY RUSSEL, Attorney for Respondent. ASHLEY POND, Of Counsel.

Mr. Baker: The court upon the preliminary hearing, appointed three commissioners, Mr. Frank J. Hecker, Mr. George H. Barbour, and Mr. Michael W. O'Brien, and they took testimony about as we are taking it here, a big volume of it, which Mr. Dickinson can introduce in evidence, if he wants to.

Mr. Dickinson: You can put it in if you want to.

Mr. Baker: No, I do not care to put — in. After they had heard the testimony, they made this report to the court, which I will read.

Mr. Baker then read report of commissioners as follows:

520 "STATE OF MICHIGAN:

In the Circuit Court for the County of Wayne.

THE FORT STREET UNION DEPOT COMPANY, Petitioner, vs.
THE MICHIGAN CENTRAL RAILROAD COMPANY, Respondent.

We, Frank J. Hecker, George H. Barbour and Michael W. O'Brien, inhabitants and freeholders of the county of Wayne, duly appointed and sworn as commissioners in this cause, to ascertain and determine the necessity of taking for the public use, to wit, for the purpose of constructing and operating a union railroad depot and station grounds in the city of Detroit, in said county, with the necessary connecting railroad tracks and accommodations, all of the real estate, property, franchises, rights, easements and privileges described in the petition in this cause; and to ascertain and determine the compensation or damages which ought justly to be made by the Fort Street Union Depot Company to the Michigan Central Railroad Company therefor, do respectfully certify and report, that we met at the office of James F. Joy, in the Hammond building, in the city of Detroit, on the 30th day of October, 1890; that the Fort Street Union Depot Company appeared by F. A. Baker, its attorney, with James F. Joy as counsel, and the Michigan Central Railroad Company appeared by Henry Russel, its attorney, with Ashley Pond. as counsel; that we then proceeded to hear the proofs and 521 allegations of the parties, and also proceeded together to view the premises proposed to be taken, and for that purpose we continued our sessions from day to day until the 23d day of December, 1890, when said cause was submitted to us by said parties: that we caused the testimony and the arguments of counsel, given before us, to be stenographically reported and reduced to writing at the request of the parties, and the same are hereby returned and filed

After said cause was submitted to us, having maturely considered the proofs and allegations of the parties, and the arguments of the counsel thereon, all of us acting together, we did ascertain and determine that public necessity requires that said real estate, property. franchises, rights, easements and privileges, should be taken for the public use, to wit, for the purpose of constructing, maintaining and operating said petitioner's proposed railroad tracks, as provided for in the plan of structure submitted by said Fort Street Union Depot Company and approved by the commissioner of railroads, which plan it recorded in the office of the commissioner of railroads of the State of Michigan, and which provides for an elevated structure for railroad tracks, and as part thereof, an elevated viaduct over the tracks of the Michigan Central railroad for teams and foot passengers, as is more fully set forth in the ordinance of the city of Detroit. granting to said Fort Street Union Depot Company the right to use and occupy River street from Eighth street to Twelfth street, and in the order of the railroad crossing board of the State of Michigan, dated November 8, 1889, approving the route selected by said Fort Street Union Depot Company, and determining the place and manner of crossing of said petitioner's railroad across the said respondent's tracks, and in the order of the commissioner of railroads

of the State of Michigan, dated April 30, 1890, requiring said 522 Fort Street Union Depot Company to erect its structure at the said crossing of respondent's track in such manner as to provide an overhead crossing for teams and foot travelers in connection therewith, and in the order of said commissioner of railroads, dated August 5, 1890, approving the plan of structure submitted by said Fort Street Union Depot Company as required by the said order of said railroad crossing board and of said commissioner of railroads.

And thereupon we did further ascertain and determine that the compensation which ought justly to be paid by the Fort Street Union Depot Company to the Michigan Central Railroad Company for the said real estate, property, franchises, easements and privileges, describing the same separately, as in the petition as amended in this cause, is as follows:

The right of way to construct and maintain said viaduct over the triangular piece of land situated at the southeast corner of River and Twelfth streets, the posts to be set as indicated on the plan

adopted by your petitioner, and the superstructure to be at least fourteen feet in the clear above the tracks of the respondent.

The compensation and damages to be paid by the Fort Street Union Depot Company to the Michigan Central Railroad Company for the above right of way as ascertained and determined by us is the sum of two thousand nine hundred (\$2,900) dollars.

523 II.

The right of way to construct and maintain said viaduct on River street, in accordance with said ordinance and the plan adopted by your petitioner, in front of the property of respondent, situated on the south side of said River street, and extending from the east line of Twelfth street to the westerly end of the westerly approach to said passageway for teams, and also extending from the easterly approach to said passageway for teams to the point where said viaduct will pass wholly out of River street.

The compensation and damages to be paid by the Fort Street Union Depot Company to the Michigan Central Railroad Company for the above right of way, as ascertained and determined by us, is the sum of eight thousand two hundred and fifty (\$8,250) dollars.

III.

The right of way to construct and maintain said viaduct on River street, in accordance with said ordinance, and the plan adopted by your petitioner, in front of the property of respondent, situated on the south side of said River street, between the easterly end of the easterly approach and the westerly end of the westerly approach to said passageway for teams.

The compensation and damages to be paid by the Fort Street Union Depot Company to the Michigan Central Railroad Company for the above right of way, as ascertained and determined by us, is the sum of fifteen thousand seven hundred and fifty (\$15,750)

dollars.

524 IV.

The right of way to construct and maintain said viaduct on River street, in accordance with said ordinance and the plan adopted by your petitioner, in front of the property of respondent, situated on the north side of said River street and extending from the westerly line of Tenth street westerly to where the tracks of respondent's railroad cross River street, and which, in the testimony, is called the flour-shed lot.

The compensation and damages to be paid by the Fort Street Union Depot Company to the Michigan Central Railroad Company for the above right of way, as ascertained and determined by us, is the sum of one thousand six hundred and sixty (\$1,660) dollars.

The total compensation and damages awarded by us is the sum of twenty-eight thousand five hundred and sixty (28,560) dollars.

Compensation for damages to said respondent resulting from the

construction of the said viaduct for teams and foot passengers is not included in this award.

Given under our hands this 29th day of December, 1890.

FRANK J. HECKER. GEORGE H. BARBOUR, M. W. O'BRIEN,

Commissioners."

Mr. Baker (to jury): You have expressed a desire to see this engine operated down there in the night-time. We would also like to have you see it in operation in the daytime, and if it is con-

venient for you all, we would like to have you go there say at half past seven tonight, at the Twelfth Street depot, and 525 we can stay there and take a trip out on the road.

Mr. Dickinson: I prefer that you (the jury) carry out the suggestion made by yourselves on Friday, that without notice to either counsel beforehand, you tell that you will go the afternoon of the

day you intend to.

Mr. Baker: You can fix it to suit yourselves. The jury will understand that I don't want to interfere with their duties. All I can say is that Mr. Joy is here, and intends to leave town early this week, and he desires to go with us to see the engine. If you cannot do it tonight, we would like you to go tomorrow.

Mr. Dickinson: How long will Mr. Joy be away?

Mr. Baker: I don't know, perhaps until the latter part of this The engine is there, and we would like you to go tonight or tomorrow night, and if you want to consult among yourselves, you may retire to your jury-room and say when you will do it. If you don't want to go now, you can wait until Mr. Joy comes back, but he takes a great deal of interest in this case, and he would like to be there with us.

Mr. Dickinson: We would like to have Mr. Joy there, but we

would like the jury to determine for themselves.

Mr. BAKER: If you do not want to go tonight or tomorrow night, wait until the latter part of the week, until Mr. Joy gets back, but it is for you to say when you will do it.

Foreman Lesher says the jury would like to retire and consult about the matter. The jury then retire and remain out of the court-room about ten minutes, and then return, and the foreman then says:

Foreman Lesher: Some of the jurymen cannot go down this evening, on account of previous engagements, so that 526we have decided to go down next Monday evening, and leave the city hall at half past seven.

Mr. Baker: Mr. Joy will be back then.

Mr. Dickinson: Will you let us see the engine in the meantime, Mr. Baker?

Mr. Baker: It is engine No. 35; it will be in operation down there all the time. Anybody who wants to go and look at it will be welcome, and we shall only be too glad to have them go and see it.

Then adjourned to Tuesday, June 23, 1891, at 2 p. m.

JUNE 23-2 p. m.

CHARLES H. ELLIS, recalled for petitioner.

Examined by Mr. BAKER:

Q. Can you tell us what the grade is of the elevated railroad in front of the property of Mr. Backus?

A. Four and one-tenth of a foot to the hundred, that is 22 feet to

the mile.

Q. And west of that is where it is 50 feet to the mile?

A. From the point just east of Twelfth street the grade descends going west.

Q. East of the Backus property?

A. From the Michigan Central crossing, it is level going east, as far as Seventh street, and then there is a little grade.

Q. Will it be practicable to have cars stand on these tracks in

front of the Backus property?

A. I think not.

Q. You could not use a track, where the grade is 22 feet to 527

the mile, for a yard, for store room? A. Cars would not stand there without the brakes on them. It is estimated the cars will stand on a grade of about 11 feet to the mile, and even on that grade a slight wind will start them.

(). Is it practicable to build elevated side tracks along this ele-

vated railroad for the use of the adjoining property?

A. Yes, sir.

Q. Is it a common thing to have elevated railroad tracks-that is, has it frequently been done?

A. Yes, sir; most all the coal business of the country is done on

elevated trestles.

Q. Have you made a plan of side tracks that could be put in on Mr. Backus' property as it is now situated?

A. Yes, sir.

Q. Does that show a side track where the cars would stand alongside of his mill?

A. Yes, sir.

Q. With the switch at the east end?

A. There is a switch at the east end of the property near the railroad viaduct, switching out of the railroad viaduct, going west onto the Backus property.

Q. So that a train that came up on this railroad could back cars

right in onto it?

A. Yes, sir.

Q. Did you make a plan with a switch west of the property?

A. Yes, sir.
Q. That throws the side track more to the easterly part?

A. Yes, sir.

528 O. The first one, the side track, would be right alongside of his mill. How many cars could you store in front of his mill?

A. Four easily, and it would hold five.

Q. You could have three right in front of the mill, could you not?

A. Yes, sir.

Q. Where they could stand as long as he wanted them to?

Q. And on the other side track they could stand over against the open shed he has there?

A. Yes, sir.

Q. Mr. Backus has a lumber yard at the foot of the old union depot grounds, at the westerly side?

A. Yes, sir.

Q. And he now hauls all his lumber up to his mill by teams?

A. Yes, sir.

Q. And with the construction of this elevated railroad, would it be practical, by putting in this side track, to handle all his lumber by cars?

A. It would be practical to handle the lumber between the yard

and the mill.

Q. By cars? A. Yes, sir.

Q. So you do away with the use of a large number of teams?

A. Whatever he hauled on the cars he would have to haul by teams.

529 Cross-examination by Mr. DICKINSON:

Q. Which way is the old union depot property on this plat as it is presented?

A. West.

Q. This would be the switch that you have put in?

A. I have two plans.

Q. The switch running in there along the front of the Backus property, the switch would come in just below?

A. Yes, sir.
Q. Whose property is this?
A. That is the Backus property.

Q. You say that the lumber for the Backus mill could be run in on the main track of the elevated structure?

A. Yes, sir.

Q. How many tracks below the Backus property are there?

A. Two.

Q. So that I understand you that it is proposed, as a legitimate and a proper thing, with this elevated structure to run cars loaded with lumber on the elevated railroad track?

A. Not that I know. This shows the practicability of it.

Q. It would have to run on the main track on here to get on the switch?

A. Yes, sir.

Q. The switch could also be used for the stove works, could it not?

A. A switch could be used.

Q. And a switch could be used for the Union mills?

A. Yes, sir.

Q. And yet all that freight connected with the switch would have to go on the main track with the elevated road?

530 A. Yes, sir.

Q. Is it proposed to do such a freight business over the main track?

A. That I don't know anything about.

Q. All those things that came up would have to go in front of Backus'—taking stoves out and so forth?

A. If they did that business.

Q. You would have to go up on the main track in front of the mill.

A. Yes, sir.

Q. Is that proposed to be done?

A. I don't know that it is.

Q. Do you know that it is a legitimate proposition to put a side track in here at one of the places?

A. It is perfectly practicable?

Q. Do you know whether it has been suggested?

A. Not that I know of.

Q. These would have to come in on Backus' property on the trestle-work, either way it came?

A. Yes, sir.

Q. And would have to be all located on this property?

A. Yes, sir.

Q. Would there be any grade in from the main track?

A. Just as they choose. It could be on a level, ascending or descending.

Q. How much can it desend?

A. For practical use it would not have much of a grade.

Q. Will you please tell me whether you have measured the height of the Backus building.

A. I have.

Q. What was it?

- A. It was a month or two ago. My impression is that it was some 45 or 48 feet.
 - Q. What is the height of the top of the rail above the roadway?

A. About 25 feet in front of the mill.

Q. How high is the smokestack of the engine?

A. Fourteen to 16 feet.

Q. How high is the car from the rail to the top of the car?

A. Twelve or 13 feet.

Q. So that the cars would run in there about 36 feet from the bottom?

A. About 36.

Q. And the height of the building is how much?

A. About 45 feet.

Redirect by Mr. BAKER:

Q. You simply testify to what the engineering possibilities are?
A. That is all.

Q. Is it practicable from an engineering standpoint to put in a side track for the use of the Union mills and the match company and the Peninsular stove works, similar to this one that has been shown here?

A. Yes, sir.

Q. And in that way all that manufacturing property along there could be furnished additional railroad facilities?

A. Yes. sir.

Recross by Mr. Dickinson:

Q. I would like to know what the grade is from the union depot

property in going out from the union depot.

532 A. It is a level grade from the corner of Third street going west to the end of the depot building. Then from there the grade rises.

Q. About how much?

A. It rises from an elevation of 22 between three and four feet.

Q. How far?

A. The distance from that point to Seventh street. be about 700 feet.

Q. It rises in the distance of 700 feet about three feet and a half?

A. Yes, sir.

Q. From Fourth to Seventh?

A. Yes, sir.

Q. How much above the present grade would it be as you cross Fifth?

A. Between five and six feet, to my best recollection, above the

present grade of the corner of Fifth and Fort.

Q. Do you know how Backus could use your switch? Does he not have facilities now, and does not every railroad, connected with every other road? Don't you understand that the law requires connections to be made with the switches he already has?

A. I have a dim recollection that one railroad crossing another is

obliged to make connections if demanded.

Q. Do you know of any trouble Backus has of shipping over the Wabash or any other railroad in the country?

A. No. sir.

Q. On your plat, which is considered the Backus front?
A. That is marked west line of Backus property, and this is marked east line of Backus property.

533 Q. Could you make a turn or a side track in there that would run by the side of his building?

A. It could be done but it would not be a practical thing.

Q. All the way you could do would be to put a switch in there between his building and the present structure?

A. That is a practical thing. I have not tried a line in there.

is possible to get in there by crossing other properties, but not to turn on this corner.

Q. Didn't you testify on the former trial that you could make

that in there?

A. I don't think I did.

Q. Did you make any such switch as this in front of it?

A. No, sir.

Q. How would this switch benefit him more than the road itself?

A. Mr. Backus can judge of the benefit.

Q. Could he not get on this track just about as easy as to get on this elevated structure?

A. Yes, sir, or a line could be run parallel to that. It would hardly be a nice thing to let the cars run on the main track.

Q. How near does your proposed switch come to the building?

A. Ten feet.

Redirect by Mr. BAKER:

Q. Is it not usual to put in side tracks alongside of buildings and other property?

A. They are usually clamorous for them.

Q. It is not usual to run a side track on a sharp curve right around into the building?

A. Not unless there is a very urgent need of it.

Q. They usually put in their side track so that the cars cannot stand alongside of a building?

A. Yes, sir.

Q. Is it practical to put in a side track so that cars can be loaded and unloaded from Backus' factory just as it is, so as to connect it with this elevated road?

A. Yes, sir.

Recross by Mr. Dickinson:

Q. You said that is used for coal cars?

A. Yes, sir.

Q. That is where there is a coal chute?

- A. That is practical and the common way of handling coal. Q. Is that what you mean as having seen elevated switches? A. That is what I had reference to in regard to handling coal.
- Q. Did you ever see an elevated switch for ordinary freight anywhere?

A. Yes, sir.

Q. Where?

A. In Cincinnati. Q. Where?

A. The Kentucky Central has an elevated freight depot. All their freight is elevated from the ground up.

Q. That is an elevated freight depot?

A. Yes, sir. And the Pennsylvania Central in Philadelphia, before their Broad Street terminal was so crowded with passenger

trains, handled their freight in that way, all lowered from the street up.

Q. The track is elevated at Cincinnati, and the freight depot itsel is elevated?

535 A. Yes, sir.

Q. The Backus property is not elevated, is it?

A. It is, three or four stories high.

Q. The business is not carried on upstairs, is it?

A. Yes, sir; we went through the mill together, Mr. Dickinson. Mr. BAKER: The very first thing they do in that factory is to elevate the lumber?

A. Yes, sir.

Q. Did you see the operators sliding the boards, commencing at the bottom and putting it up to the top?

A. Yes, sir.

Mr. Dickinson: The freight depot in Cincinnati is built itself on an elevation, is it not, set up on trestles like?

A. Simply because the grade was such.

Q. It is set up on trestles? A. Yes, sir.

Q. Do you think that is any criterion for service of business in manufactories which are now at grade?

A. Not necessarily.

Q. You mean you can serve any place upstairs?

A. Yes, sir, or downstairs.

Q. Where in the country does an elevated structure serve business concerns from an elevated railroad. You do not mean to say they do that in Cincinnati except at the freight depot?

A. I have not covered the whole country. I mean to say it is

possible and very easy to do.

Q. Do they in Cincinnati serve any manufacturing or business place from an elevated railroad?

A. I do not know that they do.

Q. Will you tell me any place where any elevated struc-536 ture serves business places at an elevation, from an elevated

A. Not exactly like this. There are places where we have to build elevated roads to reach business.

Mr. Baker: Mr. Dickinson knows where they do it. They do it in Minneapolis.

Q. Do you know anything about Minneapolis? A. I am not an expert as to the business there.

Q. Mr. Baker has said they serve the mills from elevated structures. Do you not know from hearing the testimony on that point that they do not permit a locomotive to run by on any of these roads, but they do it by stationary engines?

A. I did not hear the testimony.

Redirect by Mr. BAKER:

O. Is there any practical difficulty in making a side track that will carry a locomotive?

A. No, sir.

Q. You have seen Mr. Backus' mill, and you are a civil engineer?

A. Yes, sir.

O. Do you know whether or not it would be just as practicable to elevate that lumber from the second floor as he does it with a machine which carries it up, would it be just as practicable to do that from the second story as from the first?

A. Yes, sir.

Q. Or from any other story where the cars were?

A. Yes, sir.

Q. In fact, in unloading a car, it would be handier to shove it down hill than up?

A. Yes, sir, that seems to be the preference. Lumber mills 537 in Oscoda, all the tramways are on an elevation.

Q. So that they can pile it easy and carry it up further?

A. Yes, sir.

Q. With this lumber yard at the foot of Eighteenth-and-one-half street, would it be practicable to load cars there and to haul them up and put them on this side track and feed Mr. Backus' mill in that way?

A. Perfectly.

Recross-examination by Mr. Dickinson:

O. Do you think your cars would wait on the track while Backus made his inspection and selection of lumber which was to go up and come down?

A. The cars would be on the siding at his pleasure as long as he

pleased.

A JUROR: About what grade is there at Eighteenth street?

A. They are on the surface there.

Mr. Baker: And he loads and unloads lumber there now, does he not?

A. Yes, sir.

Q. If he wanted to shove it up to the mill all he would have to do would be to send it right on?

A. Yes, sir.

Mr. Dickinson: Do you mean to be understood that they unload a foot of lumber at the mill?

A. They use to, years ago, unload there.

Q. They have a connection with the F. & P. M. tracks? A. Where?

538

Q. By their side tracks?

A. With the Michigan Central, yes, sir.

Q. And from that with the F. & P. M.?

A. That is at their mill.

Q. With all those facilities they have good side tracks?

A. I suppose so. 40 - 55

Q. Do they unload a stick of lumber at their place from the car A. I don't know that they do.

A JUROR: You think it would improve their situation by having

this elevated road?

A. I cannot testify as to Mr. Backus' business in his mill. know, from observation, that his teams are going daily from hi lumber yard up to his mill. I know that this railroad runs from the lumber yard to the mill. It could do that business, what is being done there, every day, by a long string of teams, and his team stand in the street there continually. The cars could stand the same way on his property.

A JUROR: They could not load on the car without first bringing

it on the truck?

A. I don't know how that is. I am only saying they could draw it from the lumber yard. The matter of loading the car is a matte of detail.

Mr. Baker: With the exception of calling Mr. Lothrop for the purpose of showing what advice he gave to Mr. Mulliken, we rest

Mr. Dickinson: I desire, in connection with this switching business, to show that all roads are bound to furnish connections with other roads in this State and every State.

Mr. Baker: There is no doubt but what the Fort Street Union Depot Company is bound to put in these switches, if they ask for

them.

Mr. Dickinson: That is not the point.

Mr. BAKER: That is a part of it.

Mr. Dickinson: I read from section 3355, Howell's Stat

utes, as follows:

"All railroad corporations shall grant equal facilities for the trans portation of passengers and freight to all persons, companies o corporations, without discrimination in favor of any individuals companies or corporations; and shall, at all points of connection of intersection with the roads of other corporations, unite with such corporations in establishing and maintaining suitable platforms and station-houses for the convenience of passengers desiring to transfer from one road to the other, and for the transfer of baggage or freight whenever the same shall be desired by either corporation, or ordered by the commissioner of railroads; the expense of constructing and maintaining such station-house and platform shall be paid equally by such corporations. Such corporations, connecting or intersect ing as aforesaid, shall also, whenever desired by either of them, or ordered by the commissioner of railroads, so unite and connect the tracks of said several corporations, as to permit the transfer from the track of one corporation to the other of loaded or unloaded cars designed for transportation on both roads. No railroad corporation shall in any manner discriminate in its rates of freight tariff from the same place to the same place in this State in favor of any indi vidual, company or corporation doing business over its line of road and shall grant the same rights and privileges to all shippers, sub ject to the same rates and classification, without rebate or any other special privilege or rate, not extended to all other shippers in the same class who ship a like quantity or quantities. Any railroad corporation refusing to comply with any of the provisions of this section shall be liable to a penalty of not exceeding \$500."

Mr. Baker: In that connection I will call your attention to a provision in the union depot act, section 3489, which is as follows:

"Any corporation organized under this act, at any village or city, requiring tracks of considerable length to connect other rail540 roads with its station grounds, and where there may exist or spring up business establishments, manufacturing or otherwise, needing, or which may be fostered and promoted by easy access to railroads, shall have the right and authority to build side tracks to accommodate the business of all such establishments, and shall provide the necessary power and rolling stock for such purpose, charging only reasonable rates for the transaction of all such

business.'

Mr. Dickinson: I now propose to read some sections of the statute, from the union depot act. We have a very strenuous contention here that they could not take the Michigan Central property along their yard. I never have contended, and I do not think that they could, without further legislation, take the Michigan Central property from the junction to Detroit on their right of way for another railroad. Let us have no question about the distinction. could not take the Michigan Central property from the junction, the right of way, or any part of it, without legislation, providing it might be so taken. You cannot take it without there be a general act providing you-should take it. By the constitution you cannot You could not have a special act prohave any special legislation. viding that any new company, naming it, could take the Michigan Central property, naming it. You can have a general act, providing that any company could take such and such property, under such circumstances.

Mr. Baker: If you cannot take the right of way, how can you

take the depot grounds?

Mr. Dickinson: Mr. Baker asks me why, if you cannot take the right of way of the Michigan Central, or its railroad tracks, why can you take its depot grounds? That is what I am going to show

you. This union depot company was organized, with the statutes just as they have been read to you today, containing

this very careful provision:

Sec. 3463. "In case any such company is unable to agree for the purchase of any real estate, property or franchises required for the purpose of its incorporation, it shall have the right to acquire the title to the same in the manner and by the special proceeding prescribed in this act, but there shall be no power, except for crossing, to take the track or rights of way of any other railroad company without the consent of said railroad company."

Leaving the inference clear that they may take anything else but

the track or right of way.

Now I read you, in connection with that, this provision, and you will see how the two, and how the whole body of the law is in har-

mony. There is a provision which will protect the Michigan Central without new legislation, from taking its right of way, along its main track, from the junction in here, along its present route. You could not take up its track, you could not take up its right of way. The express provision of the statute prohibits you from taking its track or right of way.

I now read the section which I claim gives the power to condemn the right of way in this case over the grounds of the Michigan Cen-

tral Railroad Company. The section is as follows:

SEC. 3357. "When any part of the land of any railroad company in this State, in or adjacent to its depot grounds, is not in actual use for depot or other purposes pertaining to the operation of a railroad, and such land is not needed by said railroad company for the purpose of a depot or other terminal facilities, it shall be lawful for any other railroad company organized as aforesaid needing such land for the purpose of a depot or terminal facilities to acquire the same in the same manner as may now be done for such purpose from individuals. The question of actual use and of necessity, for

542 the aforesaid purpose by said railroad company owning and not using said land shall be determined in addition to other questions as provided by law in cases of condemnation of lands for the purpose aforesaid, and the same proceedings in all respects, as near as may be, shall be had for the aforesaid purpose as now provided by law where land is acquired for such purpose from individuals."

It is very clear that this matter of the use and occupation of the grounds and of the need of the railroad company for such grounds are questions which must be determined by a jury, called as you are called. They must pass upon the question of whether this is the best route. They ask the Michigan Central for the privilege of occupying the grounds, and if they fail to agree they take it before a jury. How long do you suppose it would take a jury to determine it?

Mr. Baker: Before the gentleman puts in any testimony, I desire to call attention to this section. He has made two arguments upon it, first in opening the case, and in anticipating the testimony of Mr. Lothrop he has made another argument. I will take this occasion to reply to what he has said upon this subject, so that you can hear the testimony upon the other side with a full understanding of

our position in regard to it.

Mr. Dickinson contends that we ought not to go upon River street, because it is physically possible to build the same kind of an elevated road through the Michigan Central property, either along the margin or somewhere through it; but, of course, as far as the legal question is concerned, it would be immaterial where you went. If you could go in one place, you could go in another, if it were advisable under all the circumstances.

As I stated to you in the opening of this case, there was an absolute legal prohibition upon our doing it. You could not do it, no matter how badly we wanted to. There is no power until the legislature of this State acts, by which one railroad

company could go through the property of another railroad company, whether they went on an elevated structure, on the surface,

or in any other way.

Mr. Dickinson called attention to a provision in the general railroad law, and the same provision in the union depot act, in which the power to condemn land is expressly limited, as far as other roads are concerned, to a right to cross. I will refer to that. You must remember that the powers of a corporation are all determined by the act under which it is incorporated, that they have no powers by implication; their powers must be granted to them by the legislature, and defined in the act. This act confers upon union depot companies the right to condemn land under certain circumstances. Section 6 of the act is in these words:

"In case any such company is unable to agree for the purchase of any real estate, property or franchises, required for the purposes of its incorporation, it shall have the right to acquire the title to the same in the manner and by the special proceeding prescribed

in this act."

And then it has this provision:

"But there shall be no power, excepting in crossing to take the track or rights of way of any other railroad company, without the consent of said railroad company."

In other words, you can cross the Michigan Central, but you cannot go along their property longitudinally. You cannot take their tracks and rights of way, except for the purpose of getting across.

That is what that statute means. Mr. Dickinson says there is a difference between their right of way from West Detroit down to this yard, but it must be evident to any jury that the Michigan Central track does not stop at this street. The Michigan Central tracks come a half mile further this way. There are four or five main tracks, and there are a large number of side tracks, and in order to come along there on that property at all, you would have to go longitudinally along their property, so that this statute actually prohibits, in so many words, it says right out, that we shall not do that, in just so many words, that you shall not take their tracks or their rights of way.

There is a statute, to which the gentleman has referred, under which, under certain circumstances, land can be taken; but let us see what those circumstances are, and see if they have any applica-

tion to this case.

"Whenever any part of the land of any railroad company in this State, in or adjacent to a depot ground is not in actual use for depot

or other purpose pertaining to the operation of a railroad."

The first condition that is insisted upon by this statute is that it shall not be in actual use. You cannot touch it. You cannot proceed to step under that statute if it is in use. That is what the statute says, in just so many words, and there is no ingenuity that can be exercised or used by learned counsel to mislead a jury in regard to that. The language is just as plain as it can be expressed in the English tongue.

"When any part of the land of any railroad company in this

State in or adjacent to its depot ground is not in actual use for depot or other purpose appertaining to the operation of a railroad, and '—

There must be something else even then, gentlemen of the jury-

-"and such land is not needed by said railroad company," 545 that is, if it is vacant, if it is unoccupied, if it is not used. before you can take it, it must be made to appear that they do not need it, in the immediate future. Suppose the Michigan Central had a strip of land there 100 feet wide, running right along the street or through their yard, running down to Twelfth street, and we should proceed to condemn that strip of land, under this section, all they would have to do would be to show that they had purchased that property and acquired it for a purpose connected with that railroad company, and that in the extension of their business and the development of their business they would need it, and we would be stopped there, just as absolutely as we are stopped now. where the proof is that they are in the actual use and occupation of every foot of that property. That is, I say, if it were vacant property, so that as far as the situation was concerned to the outward eye, it was perfectly sensible that we should take it, where apparently they did not need it, because they did not use it, even then we could not condemn it, if they could make any showing to the satisfaction of a jury that they needed it in their matters, in the development of their business, that they needed it for their use. If it is not in use, and if it is not needed, it shall be lawful for any other railroad company, organized as aforesaid, that is, organized under the general railroad law, the union depot company is not organized under that act, so that this section does not apply to it: but suppose it did, "it shall be lawful for any other railroad company, organized as aforesaid, needing such land for the purpose of depot or terminal facilities, to acquire the same in the same manner as may be done for such purpose from individuals."

That is, suppose you had a case where the property was 546 vacant, it was not in use, just as the north half of the old union depot grounds are at the present time, suppose there was a strip of land there, the Michigan Central had no tracks on it, and they did not use it, and we could show that they did not need it, then we would file a petition in this court; commissioners would be appointed, or a jury would be impaneled, and they would determine two questions. Suppose the Michigan Central came in and said they did use it, or came in and said, "Although we do not use it we need it," then this statute provides how these questions shall be settled, the question of actual use and of necessity for the aforesaid purposes by said railroad company, owning and not using said land (see how the statute insists on the fact of non-user) shall be determined in addition to other questions, as provided by law in cases of condemnation of land for the purposes aforesaid, and the same proceedings in all respects, as near as may be, shall be had for the aforesaid purpose, as now provided by law, where land is acquired for such purpose from individuals.

What does that mean? My brother made this kind of an argument to you, that we could file a petition to condemn the right of way across the Michigan Central property, and of course we would have to allege that the property was not in use and was not needed, and that we could go on and try that case, and we could get a determination, and from a determination of it we could acquire that property and use it. What is all that based upon? It is based upon the idea that you could get a jury to render a decision against the actual facts. If my brother's argument means anything it means that in his great ability as a lawyer and as an advocate he could take this jury, or some other jury of citizens in this

county, and he could get a decision from them that the 547 Michigan Central is not using all that yard down there. That is his theory, that he could take the case as it exists, and he could wrench from the jury in some way a decision that the Michigan Central does not use its property there. Now, gentlemen, suppose he could do that; suppose through his political and personal strength in this county and the interests of the people in this enterprise, he could get such a decision, suppose he could get twelve men in this box to decide that black was white, how long do you suppose it would take the courts of this State to set aside such a verdict? you suppose that any corporation like the Fort Street Union Depot Company, or any lawyer that had a head on his shoulders at all, would undertake any such thing? Do you suppose when the Fort Street Union Depot Company was organized in 1889, that Don M. Dickinson or any other lawyer in this city, looking through this statute, would advise the Fort Street Union Depot Company that they could go across the property of the Michigan Central? would be ridiculous. It is an absolute absurdity, gentlemen. only brought in here upon the same theory that he would insist that we should submit such a case to twelve men to try to get them to decide that the Michigan Central did not use that property, and that the Michigan Central does not need it. The fact of it is, the legislature of this State could confer power by a general act. I am obliged to my brother for calling my attention to that. They could not provide by special act, as they did in a case in Massachusetts provide, that one company could condemn a right of way over a portion of the property of another, by a special act. The only way we could have any such statute in Michigan, under our constitution,

would be by a general law, which would authorize one rail548 road corporation to condemn the property of another corporation, and with all the lobbying ability that is possessed
by my friend upon the other side, I undertake to say that such a
statute will not be passed in Michigan in the next hundred years.
Why? Simply because there would be no safety whatever to any
railroad enterprise in this State, because, if we could condemn the
property of the Michigan Central, how long would it take Jay
Gould, and the capitalists in New York, to get up a corporation to
condemn the entire terminal facilities of the Michigan Central, and
after they got that condemned, they could get together an amount
of capital, and how long would it take them to create another cor-

poration and go right to work and condemn it for that company, because the rule is that where property has been devoted to a public use you cannot condemn it to another public use unless it is authorized by the legislature, and there is some exigency or circumstance that makes it necessary; and the only case that I have been able to find is the case that Mr. Joy called attention to in the State of Massachusetts, where one company owned a small tract of land. another company owned a larger tract of land, and one company desired to enlarge a little, but the company that owned the large tract of land refused to let them have any of it, but they could enlarge their own grounds on the other side, and the legislature, in the exercise of its power, compelled that company to move over a little the other way, so as to accommodate them. There was such a case. But you would not expect the men who organized the Fort Street Union Depot Company to start out and antagonize the interests of the Michigan Central road to any such extent as that; and if we had undertaken to get any such bill through the legislature of Michigan, we would never have succeeded, because there would

549 be no particular sense in crippling the facilities of the Michigan Central railroad. They need those facilities, There is a question here of local taxation, but that is a separate question to be decided by itself; but, outside of any political question of that kind, I would not like to talk very long to the business men of this city upon a proposition to cripple the Michigan Central Why, gentlemen, one of the great things that has improved the city of Detroit is the fact that the Michigan Central comes here and has the facilities that it has. We can go on and have a great city when these railroad facilities are furnished. The Michigan Central wants that property to do the business of the city of Detroit, to do the business of the merchants and the people of the city. So that when we come right down to this subject, there can be no possible question in the mind or the brain of any unbiased man but that it is an absolute legal impossibility for us to go across that property, and that if the proposition were seriously entertained by anybody connected with the Fort Street Union Depot Company, they could not carry it through. They could neither get it through before a jury of this country, nor could they get it through the legislature and by the governor's veto in Lansing, because there is no occasion for it.

The general railroad law and the union depot act authorize the construction of railroads along public highways, and the only trouble with the defendants in this case is that they own a piece of property, and they are disgusted because we did not run through it so that they can sell the whole thing. That is the only difficulty with them. There is a route that is practical along there. Of course, if you want a route along the margin of River street, you

would get about the same grade, but you would destroy all that property just the same as you would do it, and cause more injury than to go along an elevated structure on River street; and because we did not do it, so that they could sell it out bodily, they come in and fight the enterprise on the question of

necessity. It is a mere cover. What they want is money, and they think that if they get your decision that it is not necessary they could charge the Fort Street Depot Company just what they have a mind to. They could sell that property to them for \$250,000 or \$300,000 perhaps. That is what they want to use you for, to unload that planing mill onto this company; and they are mad, they are disgusted, because we do not run through it, because we do them as little injury as possible, so that the property can be preserved for business and for manufacturing purposes.

Mr. Chipman: I regret that my friend, Brother Baker, has said some things at this stage of this proceeding which he did say. I had supposed that it would be better to argue all these questions

at the proper time.

Mr. BAKER: That is what I suggested to Mr. Dickinson. I do

not propose to have all the arguing done on one side.

Mr. Chipman: The only question that was raised by Mr. Dickinson was the question of the construction of this law, and it was very proper indeed that my brother should, as well as he could, reply to the construction which Mr. Dickinson had urged upon you. But he went into other matters, into the motives of the Backuses in resisting these proceedings, as free American citizens, under the Constitution and laws of this country. No man has a right to question the motives of the Backuses in making this resistance. It is their right under the law to simply say, we are opposed to these proceedings; we are opposed to giving up our prop-

erty and our rights for this purpose, and saying that they 551 put the petitioners, to wit, the union depot company, in this case, upon a strict compliance with the law. They put them in a position where they must exactly and literally comply with the law, where nothing will be taken for granted, where all the action must be upon their part, where, in contemplation of the law, they must make a perfect case, a case sound in every respect, without a loophole here or a loophole there, without one single item, without one single atom, necessary to show the necessity of this improvement And it is all idle to say that the opposition of the being absent. Backuses is from their interested motives, because it is their right under the law to entertain interested motives here, and to do the best they can in this proceeding. That is what they are here for. They are here to assert their rights, to prevent a great injury being done their property, to prevent a great business from being swept out, to say that that is why they are here, and to make that as a reason to influence this jury is the same as saying if a man owes you money and you go into court and collect that money, that the fact of your going into court to collect it is a reason to be urged against its collection. It is a sort of false logic. It has no foundation in law or in justice or in common sense. Of course the Backuses are interested. They are here to protect their rights, and the law gives them this jury as the guards and defenders of those rights, to see that no injustice is done to them. That is your office, the only function for which the law creates you; and yet my friend stands here and charges it as wrong on the part of the respondents in this matter, that they come to you and say, We rely upon you to exercise the function which the law devolves upon you. The court is here to do justice, and you are the court, and these men demand justice at your hands. My friend, in reply to that, says that it is wrong in the respondents to demand justice, wrong in them to ask you to do that which the law has created you for.

Mr. Dickinson: The first question is the proper route.

Mr. CHIPMAN: As my friend, Mr. Dickinson, very properly says, the first question is the proper route. That is the paramount question, and that is the question which the Backuses raise here-not the question of damages, not the question as to whether the proper route would not have carried this railroad through their property, and so have forced the company to buy their property, but whether, in view of all the facts, this railroad should have come near them at all, and as to whether, in view of all the facts and all the necessities of the case, this railroad could not have been put on the other side of the street, and the whole width of that street been left between their property and the railroad structure proposed to be built. That has been their contention, as I understand it, from the beginning-their contention in the former trial of this matter, as I am told, and certainly, as I know, their contention in the present proceeding. Now, in the pursuit of that contention, we have submitted to you a statute, a statute which to us seems to fully cover the ground which we have taken. Mr. Joy, as I understand it, Mr. Ellis, everybody admits that the route over the Michigan Central Railroad grounds would have been preferable to the route over River street, and we cannot for a minute doubt that you will agree with those gentlemen, that your common sense will be the same as the common sense of others, and that you will say that the route which would obviate the destruction of a public street, which would also obviate the destruction of private

property, will be a much better route, providing it is as near, which this other route is as near, as the route which the company propose to take up River street. They say they cannot do that, that it is an impossibility. Why? Is it because there is no power in the law to condemn franchises, to appropriate rights of way, to enter upon the grant of another railroad company for the purpose of carrying out the incorporation of this union depot project? The gentleman says that on the very face of it it is a foolish proposition, and he pictures Jay Gould swooping down here and settling over and brooding over all the interests of railroads in this city, bringing him forward as a sort of ogre, jumping from his grounds there at the foot of Twelfth street up to the foot of Third street, and confiscating everybody and everything which he meets in his way. Well, gentlemen, Jay Gould is not such a bad man for the union depot company. He seems to cut considerable of a figure down there in that forty acres they have got below Twelfth street, and he is cutting a pretty big figure in these five acres which they have on Third street, and he is trying to cut his usual figure in carrying ruin and devastation in his path, as he passes by the

property of the respondents in this case. But it is a noteworthy fact that this very section, quoted here by my brother Dickinson, was passed in 1881, the same year that the union depot act was passed, and also that the two acts were the product of the same mighty brain and the same strong hand, to wit, Mr. Joy, the head of the union depot project. Both acts, passed by the same legislature, both coming from the same man, twins, my friends, born at the same birth, christened after the same father, both of them the progeny of this union depot scheme. What did Mr. Joy

draw that act for? You know and I know that he is a man 554 that does not act without a motive. What did he put senseless stuff, if the interpretation of my friend Mr. Baker is correct, upon this statute book for? What was its purpose? Do you doubt for a single instant that he had in view the practicability and the possibility of using the Michigan Central grounds in connection with the grounds he acquired, touching them at Twelfth street, for the purpose of getting further up into the city? Have you any question about that? In what other cities in the State of Michigan is there any project of this kind on foot? Where else does any necessity arise for legislation on this point? Can you tell me, can any one show me? It does arise here, and it was born here, came from the same source that the union depot act came from, the same session of the legislature, to wit, 1881. That is a fact worth considering, and that Mr. Joy was right, that you can take part of these grounds for other railroad purposes, was demonstrated by the history of this case.

Almost the first departure from the union depot grounds at the foot of Twelfth street takes the elevated structure of this railroad within the sacred precincts of the Michigan Central Railroad grounds—their 20 acres—cuts off a corner of it, not only crosses their tracks, but goes within the holy of the holies, into the very temple itself, into this mystic and magic thirty-eight acres of depot grounds, around which the mighty protection of the law, according to my friend Mr. Baker, is put. How does this happen? According to my friend's argument you cannot get an inch of it. According to his argument the thing is so absurd, as a matter of fact, that no jury in the world would ever permit it to be taken.

Mr. Dickinson: And according to Mr. Joy the Michigan

Central are continuously hostile.

Mr. Chipman: As my friend says, the Michigan Central has been fighting them all the time, and yet, in spite of this, they go right

across that ground.

Let us see what further took place. The whole argument is that you cannot go within that ground, that the Michigan Central is hostile, that, as a matter of law, you cannot go into the ground, and, as a matter of fact, they will not let you go. But what else has happened? Why, my friends, we have shown the Michigan Central's rights to that depot up to the middle of the street, and they have received, I think, some twenty-nine thousand dollars damages for taking it. All the rights which they have for depot purposes, for necessary depot grounds, for the full use of their

grounds, are involved in their rights to the use of that street, River street, up to the center of the street, and yet this Union Depot Company have acquired that right from the Michigan Central, have paid them for that right.

Mr. Dickinson: And they condemned that right.

Mr. Chipman: And they have condemned that right as we will show it, condemned it under the very same law that you are sitting under, and the company are proceeding to build their structure upon the land they have so condemned, and I want you to bear in mind that condemning the right as they did, that this Michigan Central railroad could not defeat the condemnation, but they made them pay a large sum of money, going up to nearly \$30,000, for acquiring this right to build this railroad along in front of their property in River street.

Let us go a step further. Here are two distinct invasions of the depot property of the Michigan Central railroad, one

by cutting off a corner of it, the other by cutting off its access to River street, as they propose to cut off our access to River street; but here comes another, that is the viaduct, clear inside of these grounds, taking foot after foot of their property alongside of the street there, occupying space which might be used for travel, occupying space within these precincts which my friend says is so wholly and absolutely devoted to their need and their uses for depot purposes that no jury for an instant could take it from them. And yet it is done.

So, my friends, in view of the history of this matter, it is all, I was going to say, nonsense, but it certainly is not law to say to you that this statute does not bear the meaning which my brother Dickinson puts upon it. Let us look at that statute. Tell me what it does mean. What can it mean? I have asked you already, what was it drawn for? Why, it was a sort of Siamese twin as to this union depot act. If the meaning that is contended for it is not the meaning of it, tell me what is the meaning. What case is meant to fit?

"When any part of the land of any railroad company in this State in or adjacent to its depot grounds is not in actual use for depot or other purposes pertaining to the operation of a railroad, and such land is not needed by such railroad company for the purpose of a depot, or other terminal facilities, it shall be lawful for any other railroad company, organized as aforesaid, needing such land for depot or terminal facilities, to acquire the same in the manner as may now be done for such purpose from individuals."

That is very plain, isn't it? Can anything be plainer? This act says in effect, it does not say in effect, it says positively, that where the land is in use or needed for depot purposes that it may be condemned like other land, needed now, needed today, needed this instant, not needed ten years from now. I think the gentleman was in error when he says this term needed referred to what might happen in the future. When it is in use now and needed now, that is the meaning of the law. But when the land is in actual use and needed it cannot be taken. When it is not in ac-

tual use and not needed, then, my friends, it may be condemned exactly in the same manner as your property or Mr. Backus' property, or anybody's else property may be condemned, but with this condition. There are two other facts to be submitted to the jury in this connection, added to the investigation to be made by the jury, to the fact to be inquired into in that case like the present one. In the present case you are to inquire into the necessity of using Mr. Backus' land, and, if necessary, to ascertain what compensation he should receive for the condemnation, but in this case the question of actual use and of necessity for the aforesaid purposes by said railroad company owning and not using such land shall be determined in addition to other questions, as provided by law, in case of condemnation of land for the purpose aforesaid, and the same proceedings in all respects, as near as may be, shall be had for the aforesaid purpose as now provided by law where land is acquired for such purpose from individuals.

So that, in a case of this nature, you are to make the same inquiry which you make in the case of Mr. Backus, but in addition to that the jury is to answer whether the land is in actual use and whether it is needed by the railroad company for depot purposes. Now, it seems to me, that is very plain. It is as plain as words can make it. And yet my friend says it does not mean anything. He

says you cannot do it and you must not do it, and he says 558 if a jury should determine that the land was not in actual use, and by use is meant bona fide use, a real use, not a use for the purpose of preventing somebody from taking it, but a real bona fide use, and the need is meant a present need, and yet he says if the jury should find that it was not in such use and that there was no such need, that there is no court in the world that would let the verdict stand. It will be a sad day for the people of the State of Michigan if the supreme court of that State ever carry out the threat made by my friend, Mr. Baker, and overturn the verdict of an honest jury in their endeavors to protect the rights of the citizens and of the public in a matter of this kind. The Supreme Court, under such a state of facts, he says, would not sustain the verdict. Mr. Lincoln had a homely way of saying you had better not cross the bridge until you get to it, and I do not think that you gentlemen had better bother with the supreme court until we get to that. One thing is certain, that a judge on the bench, when the case is being tried before him, will not tolerate the lawyer who threatens him with the supreme court. He gives his best judgment uncaring and unapprehensive as to what the result will be. His only aim is to do justice, and so your aim must be to do justice and to act according to the lights which you have before you. I say to you, if it is worth anything to you, if it is worth as much as much as Mr. Baker's assertion, I say to you, that the supreme court would not do it, that there is no principle upon which they could do it, that this is a mere question of fact, in a matter which the constitution has given you supreme control over. Further than that, that the constitution has given you more control in a matter of this kind than even

a subordinate court, that it gives a jury in a court of record, because you are judges both of the law and the facts, and your findings on the facts cannot be 559 assailed. In what way can they be assailed. How can the supreme court, as a matter of law, determine the weight of testimony? How can the supreme court determine whether you believe Mr. Backus most or Mr. Joy most, when their testimony is in conflict? And yet this matter of the use and the need of that road there would all be matter of testimony for you to weigh and determine, with such lights as your experience has given you. How, I ask you, could the supreme court overturn your judgment. First, my friend frightened you with Jay Gould. Now he tries to frighten you with the supreme court. Well, my friends, I doubt whether we are any of us going to be frightened about anything. We are going to try an honest way to get at the very right of this matter and at the bottom, the very foundation of this entire proceeding as far as we can, as to whether it is necessary to use this street, and if there is a way which will preserve the street, which will preserve the rights of the public, which will preserve in fact the property of Mr. Backus, a way perfectly accessible to this company, then, my friends, it is your duty to say that they should take that way and not take the street or the property of Mr. Backus. They may thunder to you something about the expense. They say it is very expensive. But you are not here to save expense to the depot com-You are not here to count the subject of expense at all. You cannot, as honest men and good citizens, as jurors under oath here. you cannot become the guardians of their pockets. Your duty is to see that this spoliation, for it is a spoliation, the taking of one man's property for another man's use against one's consent,

560 that it shall not be perpetrated unless it is absolutely necessary, and the question of cost is not a question to be considered here either one way or the other. If the cost for going in the right way is too much, the gentlemen must abandon the project. If they go through valuable property, they have to pay for that property, and their plea that it would cost them too much, that it would be so expensive that they could not carry on the work, would not justify a jury in letting them rob the citizen of his property which belongs to him. Suppose that mill is all the property Backus has and they go right through it, and it happened to be worth a million dollars, could these gentlemen tell the jury that they must give them the property for \$100,000 or \$150,000 because if they gave the full value of the property they could not afford so carry on the improvement. So that, my friends, there is only one course for this jury to pursue. Is it necessary to come up that street, not whether the means of the railroad make it necessary, not whether it would cost them more to go somewhere else, but is it necessary, is there no other way, must they take that street or abandon the improvement entirely? We say that under this law, to go upon that ground of the Michigan Central railroad, the Central railroad owns, for depot purposes there, from the face of the earth clear up to the top of the skies. They own not only the surface of the earth, but they own

fourteen, fifteen, twenty-five, thirty feet above the earth, and clear beyond that. Are they using that, and do they need that for depot purposes there. Would any jury with that proposition made to them say that they needed all the earth and 25 and 30 feet above their tracks, and that they were using it at present for depot purposes. Why, my friends, the whole argument is that these

poses. Why, my friends, the whole argument is that these elevated tracks, wherever they go are a benefit, benefit Backus, benefit the people who use the street under them.

What damages was the Michigan Central Railroad Company made, according to the theory set up here under the petition? They could run their cars under this elevated structure: it does not cut off light; it does not prevent people connecting and doing their business: even we have had men brought from New York here to prove that; and the whole theory of this case is that these elevated roads, wherever they get benefit, they don't hurt, and above all, that they obstruct nothing; that they interfere with no business How could this elevated track running up through the center of the road, running right over one of its tracks, interfere with their railroad business? The theory that is puzzling the petitioner about light is absurd. There is plenty of light, according to their theory, the railroad company could not set up here if the light was cut off, and I am astounded that the commissioners who acted in your place, I am astounded that they allowed that \$25,000 damages for running the structure in front of the Michigan Central Railroad Co.'s property on River street; I am astonished that the company should demand it; this blessing, this great good, this means of running switches in the air up towards heaven; it is a pity these railroad men could not get nearer to heaven than the top of one of those switches; it is a difficulty to me that they should have the impertinence to say that no damage would come out of that. Now, tell me, as a matter of good sense, is it not prac-You have seen these premises. Is it not perfectly practicable to go around a track, straight along the River Street line of the Twelfth Street depot, in that forty acres there, and bring

it straight along the line of the Michigan Central until they get up to Seventh street up there, and then deflect it by a proper curve up to their depot grounds there? Mr. Joy spoke about running the line in the center of those grounds, and in the center

running the line in the center of those grounds, and in the center of the ground of the Michigan Central. Nobody proposes that. Is it not perfectly practicable to do that? It may be, and I believe it is the truth, that these gentlemen are unwilling to take the cup that they commend to our lips, that they are unwilling to have the front of their property cut off by an elevated structure, that the union depot company itself are unwilling to have that elevated structure right close up to their fence, inside of their grounds, exactly as we are unwilling to have the full use of their front there, and full access to it for all kinds of business, so that their gates may be always open, so that business may be cheaply and expeditiously done, and it does not suit them and does not suit their pockets to pursue this route along the center of the railroad track, and along River street,

and along the Michigan Central ground, and so they come to y with this project of River street; everything for the railroads a nothing for the public; everything for their property and nothin for Backus' property; they come to you and say, "We want to there, it is our interest to go there;" whereas, your duty is not look after their interest, but to look after the interest of the respon ents here, and not to give them one inch or ell unless they convin you it is absolutely necessary for them to have it. Now take th statute, and read it, and see if it does not bear us out in the position Tell me what it was made for, if it was not made for case like this. Tell me if it would not be better for all co

cerned for this railroad to go up on the Central grounds, is stead of going up on River street. Tell me if Mr. Backu interests are not at least on as important a level as the interests this company in this proceeding? The law says they should no take this street unless it is necessary, and we say it is not necessar and we invite you to that conclusion. We show you the rout which they themselves or at least their leading men agree would l a preferable route; but they say they will not take it, because under the law they cannot take it, because they know in advance that jury, if called, will determine that the railroad are using the

ground and have need to use their ground.

Now, my friends, I have asked you already, would a jury determin What do they want with their grounds? What business have they at all with that immense quantity of ground? They are there as an enemy to civilization, they are a hostile foe within the limits of your city. No other city would tolerate such a state of They are standing in the way of progress in this city Railroads come here to benefit us. The good they do us is inc dental. They come here to benefit themselves, and above all, m friends, no improvement can benefit a community which override the right of the citizen, and which stands in the way of the prope advancement of that community. They have got the whole rive front, and it is as much as we and our wives and our little ones can do to catch a glimpse of that beautiful river, the scene of the sport of our youth, to which we resorted for health and pleasure-38 acre there and 48 acres just alongside of it—and yet we are told that jury could never be got but would find that a strip of the width o

this elevated structure could not be taken from the air o 564 heaven 38 or 40 feet above the track of that road, because they were in actual use and needed for depot purposes by the

railroad company. My friends, that is an insult to your intelligence it is against the facts and it is against common sense. There is a moving out from that 38 acres of the Michigan Central. The Grand Trunk has gone out, the Detroit, Lansing & Northern is going out the Flint & Pere Marquette are going out, three great railroad corporations have gone and are going elsewhere to do their business My friend, Mr. Baker, desires you to believe that any jury who will be called upon to pass that question would treat it as nonsense, and that if they did agree to do it, the supreme court would overrule them. We take a different view.

Mr. BAKER: Mr. Foreman-

Mr. Dickinson: Are you going to reply?

Mr. BAKER: Yes, sir.

Mr. Dickinson: I think we must ask the jury to take some action in regard to the order of proceedings.

Mr. BAKER: I have the floor.

Mr. Dickinson: I suggest that the jury decide, both now and for hereafter, who shall have the opening and the closing argument. It is a matter for you to decide yourselves, gentlemen of the jury. We have no court here except yourselves. The analogies are that we should have the opening and closing. Of course if Mr. Baker goes on we shall have to reply to him.

A JUROR: What is the rule?

Mr. BAKER: I insist upon the right to be heard before this jury.

Mr. Dickinson: I made a very brief talk—

Mr. Baker: You made an argument out of order.
A JUROR: Let Mr. Dickinson finish, Mr. Baker

Mr. Dickinson: I just want to say sor ething about the 565 order of argument. Now, we are to have some arguments There is no settled practice, and it is entirely with you, gentlemen of the jury, to order the practice, in the absence of a judge, and there is no judge would interfere with your rule if you make one. The analogies are these: Whenever a person, without any cause or fault of his own, is called into court, he has the opening and closing of the case in the argument. I may illustrate by referring to the old petition of creditors in bankruptcy; they petition to have a man made a bankrupt; he is brought into court, and he has the opening and closing. If citizens make an application to the supreme court for a mandamus against the common council or against any officer of the government, he is called upon to show cause, and the citizen, the man that responds, that has not been at any fault, or does not owe any debt, has the opening and closing. There is no doubt about that, Mr. Baker.

Mr. Baker: In mandamus cases, the party who has the affirma-

tive.

Mr. Dickinson: The man that responds.

Mr. Baker: That depends upon the allegations.

Mr. Dickinson: And where there is an order to show cause, if in order to show cause, why an injunction should not be dissolved is made, or whether an injunction should not be granted, the respondent has the opening and closing in the argument. The practice in the circuit court, of plaintiffs and defendant, does not obtain here, because we are no defendant, we have done nothing, we are summoned into court to show cause why we should not give up our

property. We are not a defendant; we are not at fault, we owe no debt, we have not committed a trespass, we have not

infringed any of the rights of the railroad company; we are dragged into court, precisely as a man called upon to show cause in a mandamus case, or a man to show cause why he should not obey an injunction, or why he should not be considered a nuisance; he has the opening and closing in the argument; his most sacred

interests are called up for examination, not at his own solicitation. not by any act of his, not for any fault of his, but because somebody wants him to come in and show about it. That is the order of proceeding, and we submit to you by the analogies, we have the opening and closing. There have been some cases tried, but this is the first union depot company, under the union depot act, that has ever proceeded to condemn, and the practice has not been settled at all. though usually in the cases I have represented heretofore, although I thought the practice was wrong, I have not contended with Brother Baker about it; he has taken it, not because it was granted him or that there was a rule for it, but he has taken it as he would take almost everything there is going if I did not object; he has taken the opening and closing, because I didn't object; but look at the merits of it; look at the manner in which we are brought into court; look at the analogy in cases where people are brought into court without any fault of their own, and I ask you to decide in this case, after the testimony is all in, and now, who shall have the opening and closing. I submit it to you, and will abide cheerfully by your decision, but I think that a party who is dragged into court away from his usual avocations, and called into court to show why he should not give up his own property, ought to have the opening and closing of the argument.

Mr. Baker: Mr. Foreman, and gentlemen of the jury:
The last struggle of a drowning advocate is some question
about who shall have the opening and closing—

Mr. Dickinson: We simply want it decided by the jury. We

leave it to the jury.

Mr. BAKER: We come here and leisurely open the case to the The respondents saw fit to make their opening before I put in my testimony; but at the end of my testimony, instead of going on and putting in their testimony, Mr. Dickinson undertook to make another opening, and he gets up and makes a speech to you about this statute, and about the necessity, entirely out of order, entirely unwarranted, so far as the order of proceedings was concerned. replied to him, as I have a right to do under the law, as I had a right to do under the statute, under which you are sitting; and thereupon Brother Chipman, there being no judge to whom we could appeal here, embraces his first opportunity in this case, to make a stump speech, and now because I desire to reply to his argument, they make a point about who has the opening and the closing. Now, gentlemen of the jury, I do not think that I can change the verdict very much by argument; I do not think I can influence you so that I will carry you off your feet by argument; I do not think it makes very much difference whether I have the opening and closing in this case, but I do insist that at some stage of the proceedings, I shall have my right to reply to each and every argument that is made here, and I hope at some time during the proceedings to exercise that right, and that I will not be cut off by any point about who has the opening and the closing. Brother Dickinson undertakes to state to you that this is a case in which they had the opening and the closing under the practice-

33i ~

Mr. Dickinson: I said the practice had not been settled. Mr. Baker: The practice has not been settled, but the

568 practice in this class of cases has been settled by the general agreement of counsel for at least 30 years. The general railroad law in this State was passed in 1855 or 1857; there have been over a thousand condemnation proceedings from that time to this, beyond question. I have been connected with a great many of them myself; Brother Dickinson has been connected with them, and there has never been a case, gentlemen of the jury, but what the attorneys of the company had the opening and closing. And why? For the very simple reason that they have the burden of proof and the affirmative of the issue. What do I mean by that? I mean by that, gentlemen of the jury, that we filed a petition in this case, in which we allege, first, that it is necessary to take a certain right of way for the public use as a railroad, and we allege that we have not been able to acquire that by private negotiation with the proper owner, for the reason that we could not agree upon the terms that he asked us for the property. We find Brother Chipman getting up here and insisting that it is just such a case as you have to dispose of, viz., that the company has to satisfy you affirmatively of the truth of our allegation that it is necessary to take this right of way along River street. That is the allegation here. It is simply denied upon the other side; and Mr. Backus is in the same position as any other defendant in a case. He comes in and says that it is not necessary, and in addition to that, he says he was not offered compensation enough; so the issue was made up in that way. The issue presents a case where it is incumbent upon the company to satisfy you upon both questions, as to the necessity and as to the amount of damages; so there

can be no doubt, gentlemen of the jury, but that, as the representative of the petitioner in this case, I have the open-569 ing and the closing. I do not desire to shut off any argument that my brethren wish to make or see fit to make; I do not care whether they make it in the commencement, or in the end; when they feel like making a speech, I am perfectly willing to suspend the proceeding and listen to an argument from them at any stage of the proceeding; but after they have made it, I do insist upon the right before this jury to reply to that speech and to present the best arguments I can to upset and contradict their arguments. So, gentlemen of the jury, I insist now upon the right to reply to the argument made by Brother Chipman; I insist at this stage upon the right to do that; I suppose Mr. Dickinson would merely talk about this statute: I made no objection to it at the time, because we are not proceeding with any great regularity in the conduct of this case; I replied to it, and Judge Chipman desired to make some remarks; he has made them; he has opened a new field of thought; he has advanced new reasons; he has shown his hand and his judgment in this case; and I simply desire at this stage, before we go on with the testimony, to call attention to the argument he has made here, and to point out, if I can, the fallacy

and the falsity of it, and to convince you, if I can, gentlemen of the jury, that my client has the right of this case.

Mr. Dickinson: There you see, gentlemen, where we land; Mr. Baker will make a speech, Judge Chipman will reply to it, and so we will go on.

Mr. Baker: If you make another speech, I am going to reply

Mr. Dickinson: Then where are we going to stop? Of course Mr. Baker will have abundant time to speak hereafter; I do not speak with especial reference to this, but we would want to be heard in reply to his argument.

Mr. Baker: I have the closing; that is the law that applies to

this case.

Mr. Dickinson: Brother Baker says that for 30 years this has been the practice, under the railroad act; that that has been acquiesced in, but it has never been decided-

Mr. Baker: There is no doubt about it. You would not contend

that you would have the opening and closing.

Mr. Dickinson: We listen to you so much, that I think you ought to be replied to in behalf of the property-owners; I think that the rights of the citizen would not be sufficiently protected unless when you make an argument here you are replied to. That is my opinion about it; I think you ought to be replied to and your statements fully exploited in reply. However, the union depot act has not been passed for 30 years; it was passed in 1881.

Mr. Baker: It is identically the same as the practice in the other

cases.

Mr. Dickinson: And no union depot has been formed except this one, that has condemned property, and in which cases Mr. Baker and myself have been employed; and I ask the jury, therefore, to make a ruling, because it is going to apply to subsequent proceedings; we have all got to make a speech later on after the testimony is through, and we should have the closing; the affirmative of the issue does not decide it; it is not so in a bankruptcy case; the burden of proof is on the petitioner, but the bankrupt is given the opening and closing, for he is fighting for his commercial life; so the citizen when he is called upon to show cause why his property

should not be taken, should have the opening and closing. He is not a defendant. What has he done? Trespass? No. 571 Does he owe a debt? No. Has he committed a nuisance?

No. Violated any law? No. He is a respondent, not a defendant; he should not, on the analogies of other cases, fighting for his rights, be prevented from having the opening and closing. He should have the opening and closing. I should like to have the jury make an order in that regard. If the jury wishes to retire they may do so.

A Juron: The jury would prefer that you settle it among yourselves.

Mr. Dickinson: I shall ask to be allowed to reply to Mr. Baker, if he proceeds.

Judge Chipman: Let me call your attention to one thing, the

order of business in court. Now, I am not objecting to Mr. Baker's replying to anything I said, although he did say that I made a stump speech to you—

Mr. BAKER: I did not mean anything offensive.

Judge Chipman: If he has made a stump speech, I am too polite to say so. But you have had more or less experience in court, and you know very well that one gentleman opens, another replies to him, and then the one representing the person who opens, has the right to reply. For instance, if an objection was made to testimony in a court, or if any point of law was raised, the party who raises it makes his argument, whether he is plaintiff or defendant; the party who opposes it replies to it; and then the party who originally spoke has a reply to him. That is the uniform practice in all our courts under that rule. Now, mind you, I want you to hear Mr. Baker now, but for future purposes of this case, under that rule, Mr. Baker would not have any right to reply to me. That is the ordinary practice. Mr. Dickinson made an argument, Mr

ordinary practice. Mr. Dickinson made an argument, Mr. Baker replied to it, and being on the same side as Mr. Dickinson, would under the rule, the ordinary rule, have a right to reply to him; that is the ordinary practice. And while I do not propose to apply it to this, I wish you would apply it in the future, and I wish also you would carry out Mr. Dickinson's suggestion about the closing of the case. I call your attention to that, because the matter is constantly coming up in this case, I see, and you ought,

as far as you can, to pursue the methods of courts.

A JUROR: We would like as much as possible to pursue the

methods of courts.

Mr. Baker: If you desire to do that, the only ruling you can make, after we get through with this argument, when we come to argue this case in the end, if you desire to follow the rules of courts, would be simply to hold that the petitioner, like the plaintiff, has the opening and closing. There is no doubt about the law, nor any question about the position of the parties. As I said before, this argument was an irregular argument.

Mr. Dickinson: Do you call us a defendant in this case?

Mr. Baker: Yes, sir; you are the respondent, and the respondent is the same as defendant; that is the meaning of the word.

Mr. Dickinson: Is there any question where a defendant or person occupying a position, and called a respondent, does not have

the opening and closing?

Mr. Baker: Take the respondent in any case, he is a defendant. We can call Mr. Backus here the defendant, if we see fit. The respondent is the defendant.

Mr. Dickinson: You call him that in order to get the opening

and closing.

Mr. Baker: I do not; there is no doubt about who has the opening and closing.

A JUROR: How shall we decide this question?

Mr. Baker: You can ask the advice of the circuit judge in regard to it, if you see fit. All I insist upon is that if they make an argument and discuss this case, I shall have a reply, and if the jury

will permit me, I will occupy the half hour between now and five o'clock.

Mr. Dickinson: I decidedly object to having our rights carried away, like an obstruction on a railroad track, by Mr. Baker in this manner. He will have everything that he can get or you will give him, and I do not like to be run over in this way, and I would like the jury to fix the rule of procedure.

Mr. Baker: Mr. Dickinson, you have got to stand up and face this case as it is, and it appears by the evidence, and you cannot, by mere argument, sir, you cannot by claiming the closing, or a mere trick upon the order of proceeding, stifle this case as it is here before this jury.

Mr. Dickinson: No, sir; I do not think we stifle or want to stifle

this case, but we will have an orderly proceeding.

Mr. Baker: We will, but at the same time I shall present the case of this company, and I shall present it in such a way, I hope, gentlemen of the jury, as to dispel the arguments, the delusions and the hallucinations that have been brought into it by my learned friends, with the utmost respect and deference for them; I have known them for years; they are doing what they can for Mr. Backus, but they have no right to do anything more than what professional gentlemen should do in a case of this kind, and I have no

574 right to do anything more than what a professional gentleman and lawyer should do in presenting such a case to a jury; and I will leave it to you, gentlemen of the jury, whether I talk about this case and whether I present it so that you can understand my position and the position of the company in regard to this company, and in regard to the issue that you are called upon to Judge Chipman says that Mr. Backus opposed this enterdecide. Of course he has a right to oppose it; he has a right to come before this jury and insist that there is no necessity for the union depot, that there is no necessity for going up River street, that there is no necessity for going through his property or any other property. He has a right to antagonize the enterprise, as he has from the commencement of it down to the present time; but because he has that right, because he has a right to come in and contest it, it does not follow that a jury sitting here to pass upon his rights and the rights of his company are to agree with him in that antagonism and in that hostility. He has a right to question the necessity of using the property, the street in front of his property, for the purposes of this elevated road; but the question whether it should be used or not, under the law and the constitution of this State, must be left to a variety, a number of tribunals, and a number of jurors or commissioners. You are a part of that system, you are one of a number of juries that have been called, and the question presented to you for decision, or that will be finally presented to you for decision, is whether or not this property along River street, a right of way for the construction of an elevated road, is taken for the public use and benefit under the union depot act and the constitution and laws of this State; and upon that question I claim, gentlemen of the jury, there can be but one intelligent decision upon the facts that

are already in evidence. The only contention that they make here in regard to this route is, that we ought to go along the Michigan Central property. They probably do not remember that Mr. Backus, when he was advocating before the railroad crossing board and in other places, thought they ought to go between River street and Fort street, so as to go right through his property; they do not remember that, but that will appear here in due time. They shifted their ground, and finally they come before this jury and they insist that we should go upon the property of the Michigan Central Railroad Company, and Brother Chipman comes in here and makes an argument to convince you that is so, and the first proposition that he makes in regard to it is this: That Mr. Joy, under the testimony—and there is some intimation from Mr. Joy to that effect—drew both these acts in 1881.

Mr. Dickinson: What did you state was the first ground?

Mr. Baker: That Mr. Backus wanted us to go between River street and Fort street, so as to right through his property.

Mr. Dickinson: I have nev heard of it.

Mr. Baker: I said that Mr. ackus said so. You do not know anything about it. I say that J. dge Chipman says Mr. Joy drew both these acts. Now, did my brother fully comprehend what kind of an argument he made there? You have seen Mr. Joy upon the stand; you have heard his testimony, that he was educated for the bar, was the general counsel of the Michigan Central for years, was president of it afterwards, has been in railroad business all his life, and he is undoubtedly one of the best railroad lawyers in the Northwest, if not the best, because that has been his business; he is a

trained lawyer, has practiced his profession in this city, of 576 the old firm of Joy & Porter; many of this jury will remember the firm; he was the general counsel of the Michigan Central railroad from its organization down to the time he became the president of the company; he went to Chicago, built the Burlington & Quincy, built all these lines in Michigan that are ancillary to the Michigan Central, using his legal knowledge and information all these years in the aid of the performance of his duties in these trusted capacities; and Brother Chipman comes here and says that Brother Joy got this act passed; that Mr. Joy framed this statute, got it through the legislature, and then is such a fool that he does not use it to condemn a right of way across the Michigan Central property; although he got this statute passed, and evidently knows what it means, Brother Chipman insists that Mr. Joy is in this ridiculous position, that he got this statute passed which would enable him to condemn a right of way across the Michigan Central, and then does not use it, although, as it appears in this testimony, he has not been connected with the Michigan Central since Mr. Vanderbilt purchased that road; has held opposing and hostile interests, and has been engaged in a controversy with the Michigan Central ever since the old union depot was organized and started down to the present time; that the best railroad lawyer in the Northwest would get such a statute passed, and then he would come to use it to condemn a right of way, he does not use it, he just simply says, " Why, I cannot condemn a right of way across the Michigan Central, although I got this statute passed for that very purpose." Gentlemen of the jury, does any such argument convince you that the statute means any such thing as my bretheren contend?

And Brother Chipman appeals to you and says, "Why, what does it mean if it does not mean that we call why, what

does it mean if it does not mean that we could condemn a right of way across the Michigan Central?" It happens, gentlemen of the jury, that the city of Detroit and the Michigan Central railroad yards are not the only ones in the State of Michigan; there are very many cities and many railroad yards, and undoubtedly in some of these cities the company have got the title to property that is unoccupied, and in some of these cities, undoubtedly, there is property that they do not use and there is property that they do not need; and this is necessarily a general law, which applies to the whole State of Michigan, and therefore the legislature has said that if there is any such property in any city or village in this State, any property in or adjacent to a depot ground that is not in use, and is not needed for the purposes of the company owning it, that it may be taken and condemned under this statute, if it is needed for some other company, so that there can be no possible question as to what this statute was designed to do, there can be no possible question as to its objects and purposes. It is just as plain as the English language can express and make it.

Another argument that he makes, gentlemen of the jury, such as it is, to convince you that we have the right to go across the Michigan Central property, is the fact that we have condemned the right to take a triangular piece of land, having a frontage on Twelfth street of about 29 feet; he says, "Why, gentlemen of the jury, they have actually condemned that, and if they have done that, why cannot they condemn all the rest they want;" and they ask that as a knock-down argument. It happens, when we come to the

proofs in this case, that it appears that that property was acquired under a contract with the Michigan Central Railroad Company, by which they agreed, in so many words, that we could condemn that triangular piece, and in which they agreed in so many words that the posts for the viaduct for teams could be put on their property; their agreement, signed by Henry Russel, as the general attorney and acting president of the Michigan Central Railroad Company, just exactly what we claimed it was, just exactly the state of facts as would authorize us to go on and leave that question to a jury and have it decided. It was done simply because the Michigan Central Railroad Company was willing it should be done; it merely takes off a triangular piece of ground, and deprived them of the use of a track, upon which two freight cars could stand; that was the evidence; it is 29 or 25 feet, something like that, on Twelfth street, and if it was squared, it would be about equal to a lot; it runs out some 250 feet, but if it was squared it would be equal to a lot of about 250 feet back on Twelfth street, with 25 or 29 feet in front, and the jury just allowed them a hundred dollars a foot for it, \$2,900. And still my brethren come in here and make an argument that we should forcibly take

their property, because they have consented we could take that triangular piece. Nothing could be more misleading. I would not question the motive of our distinguished friends, but it is a little wonderful that my learned friends would argue seriously to a jury of this kind that because the Central consented to our taking that small triangular piece of only 29 feet on the corner of that street, therefore we had a right to take a strip for our elevated road right across their entire frontage. And in that connection, gentlemen of the jury, Brother Chipman had occasion to refer to the damages, as if the sum of \$28,560 that was allowed there was some enormous verdict that could be explained only

upon the theory that the damages were very large; and he 579 made an appeal to you that was based upon the enormity or size of that verdict. Now, what does it mean when you come right down to it? In that \$28,560 is \$2,900 for that triangular piece, a hundred dollars a foot for what would be 29 feet on Twelfth street if it was squared up, 150 or 200 feet; the rest of the verdict is made up of three other items; one is an item of \$1,660, or \$10 a foot for 166 feet of frontage where the flour shed is, property that, as far as the frontage upon the street is concerned, as far as the situation of the property with reference to the elevated road is concerned, is identical with the property of Mr. Backus, though it is more valuable property, being on this side of the crossing, and you are not obliged to go over the crossing either way in order to reach it from the central part of the city. And the commission consisted of as intelligent business and as able business men as are in this city, and they awarded the Michigan Central ten dollars a foot. Backus' award, upon the same theory, would be \$2,389. Then, when we come to the property on the south side of the street, we find that the elevated road runs in front of the Michigan Central property for very nearly half a mile, according to the testimony, about 2,300 feet, and they allow for a part of that, for about 800 feet, \$8,500, or something like that; and for the 1,300 feet they allow \$15,000 and odd, or a total of about \$12.50 per foot. That is what Mr. George H. Barbour, Col. Hecker and Michael W. O'Brien allowed the Michigan Central as compensation in this case. And who are they? Col. Hecker is one of the most successful business men in this city, the president and manager of the Peninsu-

lar car works, a man who has made a fortune, and made the money himself—he did not inherit it; another is Mr. George H. Barbour, the head of the Michigan Stove Company, another successful business man; and the other is Mr. Michael W. O'Brien, the president of the People's savings bank, who organized and established and built up one of the greatest banking institutions in the Northwest. So that we have, when you come down to what the damages are, the judgment of good men as to what they are, as to the damage the Michigan Central railroad will sustain because of the erection of this superstructure.

Mr. Dickinson: Did they take sparks into consideration, in esti-

mating the injury to the Michigan Central?

Mr. BAKER: They took everything into consideration, I suppose.

Now, Brother Chipman made an argument to yeu, in which he said. "I say to you "-that was his language-"I say to you that the supreme court would not overturn a verdict of a jury;" and he desired to pledge his word, as a member of the bar and a citizen here, as against my own, upon that proposition. Now, gentlemen of the jury, I think I can explain the situation that any such case would be in. I do not think anybody who will think a moment about it could be misled upon that subject. If we desired to condemn a right of way across the property of the Michigan Central railroad, we certainly would have to bring ourselves within that statute, and we would have to allege in the first place that the Michigan Central did not use it; we would have to allege in the next place, if it was not in use by the Michigan Central. we would have to allege, not only that they did not use it, but that they did not need it; there is no question about that. Suppose we went to this very jury upon that question. We put in the testimony of Mr. Sutherland that the Michi-

gan Central Railroad Company did; the jury went down to look at the property. Do you believe that you would find that the Michigan Central Railroad Company does not use that property? Do you think that any argument could be made to you that would lead you to any such conclusion? Do you believe that my learned friends could convince you of any such thing? But suppose they could, my brethren know, the youngest member of the bar knows, that if a jury decide anything without any evidence before them tending to prove the fact, it must be set aside as an unwarranted verdiet; the supreme court would set it aside. If the circuit judge did not do it, the supreme court would do it, and the whole contention of our learned friends is that we could go on and condemn that property, and by hook or crook we could go on and get a verdict, and they would sustain it. The language of my brother was guarded, "That the supreme court would not set aside an honest verdict." I agree on that. But would such a verdict be honest, where twelve men found against the evidence, and found a verdict that the Michigan Central did not use and did not need their property down there, if it was not used. It is absurd, it is the last effort of drowning men, when they undertake to make any such argument before you. It is an appeal to your prejudice, gentlemen of the jury, and Brother Chipman, forgetting that he is before a jury in a court of justice, thinking that he is upon the hustings, says, "Why, it is everything for the railroads, and nothing for the people," trying to arouse your prejudice, trying to excite your political feeling, perhaps, in making an appeal of that kind to you, when it is a naked question, under the issue in this case, of neces-

sity and damage; and he goes on to say that these railroad companies are a hostile force in your midst, an enemy inside of your lines, trying to break down the city of Detroit, trying to destroy your city, trying to destroy your homes and your property and to bring desolation here. He talks to you in that way, to you, a jury of intelligent business men and citizens, who have lived long enough to know that the city of Detroit will be just as big as

the railroads and the territory tributary can make it, and no bigger; men who have lived long enough to know that the greatest city on this continent, to be the greatest city in the world ultimately, the city of Chicago, has been made because it was so located with the railroads terminating there, that they brought the entire Northwest and Southwest and West to its doors. There we have a city that has outgrown the city of Detroit in Mr. Joy's lifetime. In 1846, down to 1851 or 1852, under his testimony, and no one will doubt its correctness, the city of Detroit was a bigger city than the city of Chicago then was; and you stand in the center of the city of Chicago and draw a half-mile circle, and you take in four or five union depots that are not more than half a mile away from the business center of the city of Chicago; and because we want something of that kind here, because we want facilities for these companies here, so that business can go on, my brethren insist that we are obstructing the view of the Detroit river, that our children and our good wives cannot get down to the river. Why, gentlemen, there will be enough river left for us all; but of what use is it to be here when we cannot have money and means to enjoy the river; what use is it to be here at all, unless this city is to grow and develop and be a great city; and can it do so if we are not to have any railroad facil-

ities, or only imperfect and inadequate facilities, and if every time anything is to be done for the improvement and development of the city, the interested property-holders intervene and come in and appeal to a jury and ask them to stop it, because, forsooth, they may sustain some incidental damage, that can be adequately returned to them in the very proceedings in court.

Mr. DICKINSON: We ask you to take the most direct route.

Mr. BAKER: You ask us to take the most direct route! How inmovent and childlike and bland you are! You know that if you get a verdict from this jury, that we cannot go through there; gentlemen of the jury, we know it, if they don't; we will be either in the hands of the Michigan Central and be compelled to pay them any price they may ask, or that this entire enterprise will be in the hands of Absalom Backus, Jr., and he can unload, perhaps, his en-

tire property onto this company.

Mr. Dickinson: Will you take our yard and storehouse, as well? Mr. Baker: No, sir; we do not intend to take any of it. What are you here for, gentlemen of the jury? They seem to assume that you are here to stop this enterprise in some way. Is that so? Is not this the situation, is not this the law that exists in regard to a proceeding of this kind? If railroads could be built without exercising the power of eminent domain and condemning property, the supreme court would undoubtedly hold that they would have to buy their property at the best price they could get the owners to sell it for, the same as any one else, any individual would be compelled to do. The necessity of exercising this right arises because of the absolute impossibility to build a railroad, or to allow us even

the shortest street by private treaty, because everything has to be done within financial limits, and if you wanted to lay out a street in this city today, and did not have the power of

eminent domain, sooner or later you would come to a property. owner that would want ten or a hundred or a thousand times the value of his property; and it has occurred time and time again, and will occur as long as the passion of avarice and the desire to acquire property exists in the human breast. I do not find any special fault with it; I just simply say it is a fact, and that if you started out to build a railroad down through that property, and you bought the first piece, and after a while you got the next piece, and after a while you got the next one, finally you would come to a man that you could not do anything with at all; he would not sell even: you do not know how obstinate men are sometimes; they would not even fix a price; and if they did fix a price it would be beyond anything anybody could pay for it. That being the fact, it is recognized by the constitution, it is recognized by our laws, and if we desire to lay out a canal, or highway, or railroad, or plank road, or anything of that kind, that must be continuous in its line, the power of eminent domain is conferred for the purpose of enabling the property to be acquired for its reasonable worth, that amount to be determined by a jury of intelligent citizens, freeholders, that are called for that purpose. Nothing could be fairer or more just.

One word more, as it is five o'clock. We have already shown you that we have gone on and acquired the union depot grounds; we have acquired the right of way down to River street; we have acquired substantially all the right of way along River street, but that of Absalom Backus. Now, the whole object and purpose of the

power of domain would be frustrated if at that point a jury 585 would agree with Mr. Backus that he would not or should not sell his property at all. Suppose we laid down another route, and we went along acquiring property, and finally we found a jury that said, "Why, you cannot go across this piece, we do not think it necessary, we disagree with everybody else that has ever sat in the case, we think you ought to go somewhere else;" why, you could never build a railroad under existing laws if jurymen acted on that theory. So that when you come to consider your verdict in this case, you should consider the whole enterprise, what has been done, and what remains to be done, and what is reasonable and just under the circumstances. Perhaps, gentlemen of the jury, if any of you had been on the State railroad crossing board you would have said, "Why, you had better go through the route of the Michigan Central, or you had better go through Backus' property;" but we had to submit this route to that board, and that board had a right to decide where we would cross the Michigan Central, and that board decided we should do it at River street, and that is the first step we had to take; and there is the State authority, the railroad commissioners, that represent the people of this State, including the city of Detroit, putting us in River street by his official or semi-official act. In the next place, we had to go to the common council of this city before we could go any further on this street; and the common council agreed in an ordinance with us by which we could go along that street. In the next place, we had to acquire the right of way from abutting property-owners.

As the Michigan Central owned the largest amount of property along that street, and had any amount of money to fight us with. and was hostile to the enterprise, as hostile as anybody could be, we commenced a case against the Michigan Central to 586 see how that would come out. They preferred three commissioners instead of jurymen, and three commissioners were appointed under the law, and we tried the case for about two months. and they fought us step by step and inch by inch, but finally the truth prevailed, and they found that it was necessary to go along this property, and they assessed the damages on the north side at ten dollars a foot, and at about twelve and a half dollars a foot on the south side. We applied to have the verdict confirmed, and the circuit court of this county confirmed the verdict, and within sixty days I took a check to the Michigan Central to see if they would accept it instead of appealing or further contesting it, and I was agreeably surprised to find that they accepted the money and had given up the fight. In addition to that, gentlemen of the jury, it was necessary to acquire the right of way from the property-owners on the north side of the street, and we commenced the necessary proceedings. Brother Dickinson appeared before a jury of twelve men in behalf of Kidder & Piper, the owners of the Union mills. We contested that case inch by inch, as we are contesting this case, but in the end the truth prevailed, the right prevailed, and the award was made that public necessity justified the taking of this right of way along that highway, and the damages were assessed at \$21,250, and it has been paid. In addition to that, there were a large number, or quite a number, of properties along there, owned by Mrs. Barbara Steadley, Mr. and Mrs. Ruhlman, Mrs Catherine Harpfer, and we tried case after case, with the same result, that in the end, no matter how much they objected, or criticised the efforts of this company in this enterprise, a verdict was given that it was a public necessity, and the dam-587 ages were assessed? In the case of a piece of vacant property that had no business or building upon it, it was assessed at \$31 a foot, or, under the evidence, about one-third of the actual value of the land itself. This is the situation of this enterprise. And my brethren appeal to you as to your power; they ask that, because you have the power in this box to bring in a verdict and kill this enterprise right here, you ought to do it; they think that if they can convince you that you have the power to do it, you will do it, that you will just squelch us without any further proceeding. We have everything else but Absalom Backus, but his rights are so

inconvenience that all these other people must submit to, and take what he is reasonably entitled to and no more. That is the issue, gentlemen of the jury, that you are called upon to determine in this case; and some time in the course of the proceedings I hope all of the facts will be brought out, and you will be in full possession of every element that should enter into your deliberations, and you can go out and consider your verdict, and will bring in one that at

almighty sacred and so dear that he must not submit to the same

least will be satisfactory to your own consciences and your own judgments.

Mr. Dickinson: They will not go out on the facts as you have

stated them in the last fifteen minutes.

Adjourned to Wednesday, June 24, 1891, 2 p. m.

588

JUNE 24, 1891.

Mr. Dickinson: I shall not at this time refer to some of the very extraordinary statements of facts made by Brother Baker. I shall reply later, at length. I only think it leads to repetition. Therefore, with your permission, we will proceed with the testimony.

EDWARD H. MARTINE, sworn for respondents.

Examined by Mr. DICKINSON:

Q. Where do you live?

A. New York city.

Q. How long have you lived there? A. Forty-nine years; born there.

Q. What is your business?

A. Real-estate broker and appraiser.

Q. You are a brother of Judge Martine, of the court of general sessions?

A. Yes, sir.

Q. And formerly district attorney of the city and county of New York?

A. Yes, sir.

Q. How long have you been engaged in the real-estate business?

A. Over twenty-five years. Q. Where is your office?

A. No. 60 Liberty street, New York. Q. How far is that from Broadway?

A. Directly opposite the Real Estate exchange.

Q. About what amount of real estate do you handle in the course

of the year, buying and selling?

A. I have done as high as a million dollars a year; when I say that, I mean I have bought and sold that amount of property.

Q. You do a regular real-estate agency business?

A. Yes, sir.

Q. Will you please state whether you have had anything to do

with the valuing of property in the city of New York?

A. I have been employed by the city of New York as one of the appraisers of property from the north line of New York, Yonkers, down to Thirty-fifth street, land taken for the new aqueduct; also land taken for the new park in the Twenty-third and Twenty-fourth wards. I have been employed by them to appraise armory sites, about a dozen school sites in different parts of the city, and various other matters which I get now.

Q. I suppose you are engaged in the appraisal for the city at the opening of Convent avenue?

A. I was.

Q. Are you familiar with the real estate that is situated on the lines of streets that are now traversed by elevated roads?

A. Yes, sir.

Q. Will you please point out the principal lines of elevated railroads in the city of New York upon the map which you have brought with you, and which is upon the wall?

A. The first line is what is called the Third Avenue line, which runs from the Battery to Front street, to Chatham square, up the Bowery to Third avenue, to One hundred and twentieth street. The Second Avenue line runs parallel to it, down to Twenty-

third street, and then east from Twenty-third street to First 590 avenue, down First avenue to a continuation of First avenue. Houston street, to Allen street, and through Allen street, and joins the Third avenue and goes down Third street. Then we have the Sixth Avenue line on the west side of the city, which is at the South

ferry and crosses Battery park and runs north to Greenwich street, through Greenwich street to Ninth avenue at Fourteenth street, and continues up Ninth avenue to One hundred and tenth street, east to Eighth avenue, to about One hundred and fifty-fifth street. The Sixth Avenue road also commences at the Battery and runs on the Ninth Avenue track until it strikes Church street to Murray, through Murray west one block to West Broadway, on West Broadway to West Third street, and then to Sixth avenue, on Sixth avenue to Fifty-third street, and then Ninth avenue to One hundred and fifty-fifth street, which is also the continuation of the Sixth Avenue road on Sixth avenue.

(). Will you state whether in your business your attention has been called to the effect upon real estate and rental values of ele-

vated roads in New York?

A. Yes, sir.

Q. Will you tell the jury how high in the clear the elevated roads in New York are above the roadway, on the average, through the

city?

A. They are generally about 21 feet from the under side of the structure to the roadway. There are one or two exceptions on the upper part where it goes nearer the street, but only for a block or two in any instance.

Q. And there is nothing I believe carried on the elevated roads except passengers-no freight carried on the elevated structures?

A. With one exception, what we call the Northeast Railway of New York, which starts from One hundred and fif-591 tieth street in connection with the Sixth Avenue road, which has one baggage car, which carries trunks and such things, but not freight, from Fifty-third street to Eighth-avenue and to One hundred and fifty-fifth street to connect with the Northern road.

Q. Point out on the map where it connects with the Northern

road.

A. At this point.

Q. That is one baggage car?

A. One baggage car.

Q. In any other place in New York do the elevated railroads carry anything but passengers?

A. No, sir.

Q. The engines are very much lighter than the locomotives of the trunk lines?

A. Yes, sir.

Q. And the cars? A. They are.

Q. Do you know what coal is burned in the locomotives of the elevated roads?

A. Hard coal.

Q. Do you know whether, from the elevated road as it now runs in the city of New York, burning hard coal, as it does, there is any danger from fire. Do you know of any fires burning awnings or anything of that sort?

A. There have been several occasions where the canvas awnings

have burnt up.

Q. Will you take the east side of New York, take the Third Avenue line that runs through Pearl street and the Bowery. Pearl street, before the elevated road, was a leading business street, was it not?

592 A. It was.

Q. What class of businese was done there?

- A. South of Wall street there was a cotton trade generally, largely. Above that, Maiden Lane, tobacco, and above that hardware and iron-work.
 - Q. Pearl street was known as Cotton street, the lower part?

A. What we call Hanover square, below Wall street.

Q. How wide is Pearl street at this point formerly occupied by the cotton goods?

A. About 50 feet in the narrowest part. Below there there is a

place called Hanover square, about 50 feet wide.

Q. The cotton dealers were about Hanover square?

A. They were. In fact, they took the cotton exchange originally in the narrower part.

Q. Hanover square is little more than a widening of the street? A. Nothing more than the west side is cut off diagonally and

makes it larger at one end than the other.

Q. At this point, except at Hanover square, the street was 50 feet wide?

A. It varies. Pearl street, from Quincy street to Wall street, is 50 feet, with the exception of Hanover square, spoken of.

Q. That includes the sidewalk?

A. Yes, sir. Wall street to Maiden Lane 50 feet, the same to John street and Fulton, Fulton to Beekman 37 feet wide, Beekman to Ferry 431.

Q. At the point where Pearl street is 50 feet wide, what is the

number of tracks in Pearl street?

A. Two tracks.

Q. When was the elevated structure put upon Pearl street?
A. It was commenced in the fall of 1877, in November, and was finished in June, and cars were running in August, 1878.

Q. Will you state whether at Hanover square and below, at this

Q. Will you state whether at Hanover square and below, at this point which you have spoken of as devoted to cotton business—this is in the principal business part of New York?

A. Pearl street was the leading business street east of Broadway.

Q. Will you state what effect, if any, the construction and the running of the elevated passenger cars upon this structure, what, if any, change it created in business?

A. It has made a change. Q. What is that change?

A. Smaller dealers have got on the street. For instance, one building, formerly a storehouse, was turned into a tenement-house, which is a very rare thing and of a cheaper character. And buildings, instead of being rented to one tenant, are rented to several, in lofts and apartments.

Q. Business has got to be miscellaneous and of a cheaper char-

acter?

A. Yes, there are small eating-houses and the depots for western lager beer firms. One little tailor has got in there in a place occupied by a cotton broker, and there are some insurance brokers and customs-house brokers, and things of that kind.

Q. Do you know of any instance in your own knowledge of the changes in value on Pearl street by reason of the elevated road?

A. I do.

Q. Will you give the jury some instances that are within your knowledge on Pearl street?

A. Do you want the selling and rental value?

Q. Anything in your own knowledge.

A. 87 and 89 Pearl street, between Quincy slip and Old slip, granted in 1873, for \$9,450.

Q. What was it occupied for?

A. An office building, called the Armitage building. I think I may state the reason why I made the comparison in 1873. In 1873 we had good times before the panic. In the following fall the failure of Jay Cooke & Co. produced the first thing in the panic, and in New York prices ran down until 1877 and 1878, and after that prices rose, and in streets outside of elevated railroad streets downtown specially, prices went up from 25 to 33½ per cent. beyond the 1873 prices, and I compare good times now with good times then.

A JUROR: Has that anything to do with the elevated road—the

times?

A. It has this to do with it in making my comparison.

Q. You are speaking of the times?

A. The times were good in 1873, and they were bad in 1877, at the time the elevated railroad was built, and I want to show how property in New York has risen, how it compares one good time with another. It would not be fair to compare it to 1877, because everything has risen since then.

Q. This property, 87 and 89 Pearl street, what was the rental?

44 - 55

A. That is the Armitage building, an office building, it rented for \$9,450 in 1873, and in 1887 and 1888 for \$5,415.

Q. Right in that connection, in 1873, real estate soon after that became depressed, did it not?

595 A. It did.

Q. When did it recover?

A. Its recovery was commenced in 1879 and 1880, and prices got back along in 1885, and have continued, generally speaking, to rise since then.

Q. Will you go on and make any other statement within your

knowledge as to the effect upon Pearl street?

A. 173 Pearl street, a building used for manufacturing tin cans. that property rented in 1873 for \$3,000. It rents now for \$1,500: 174 and 176 Pearl street, store on first floor, offices upstairs, the building in 1873-'4 I had for sale; the price was \$60,000, renting for \$6,000 a year. It was sold in 1882 for \$29,000, and the present owner gets \$3,800 rent.

A JUROR: What is the height of that building?

A. A five-story building.

Q. In 1882, at the time of this sale, had property, other than that where the elevated railroad ran, risen in value, and did it continue to rise?

A. It had risen some in 1882.

Q. It certainly was equal in value to what it was in 1873? A. Not quite. About 1885 property generally would be.

Q. Go on.

A. No. 175 Pearl street, four-story and attic, brick store, rented in 1873 for \$3,000; it is now renting for \$2,000 a year. 179 Pearl street, four-story warehouse, rented in 1873 for \$3,000; it rents today for \$1,500. 182 to 186 Pearl street was sold in 1872 for \$77,000, and in 1882 was sold for \$60,375. The southeast corner of Maiden Land and Pearl street rented in 1877, the year before they com-

menced to build the road, for \$5,100; it rents now for \$3,350. 596 Q. Are the tenants the same or as permanent as before?

A. They are not.

Q. They shift, do they?
A. They move oftener, create more vacancies than they used to.

Q. In giving the rental value, the rents received, when rented, does that state the whole loss, covering the time that the stores are vacant, changing tenants?

A. It does not, because in the Armitage building, where the rent was over \$5,000, the actual collections were less than \$3,400 in one

year.

Q. Go on, if there is anything further that you know of your own

personal knowledge.

A. 138 Pearl street, running through to Water street, in 1874 the property rented for \$9,550, and the rent now is \$5,175.

Q. That is what is charged? A. That is the rent-roll.

Q. Do you get the same class of shifting tenants for that, frequently changing?

A. Yes, sir; that is an office building; 144 Pearl street in 1873 rented for \$5,950; the rent now is \$2,834; 102 Pearl street rented in 1873 for \$2,200 a year; it rents now for \$1,200; 306 Pearl street, from 1872 to 1875, rented for \$2,250; in 1888 and 1889 the rent was \$1.600; 130 and 132 Pearl street in 1872 rented for \$12,000, and rents new for \$5,625; that is an office building; 244 Pearl street, from 1872 to 1877, rented for \$2,500, in 1890 it rented for \$1,750; new front put in the store; 46 Pearl street in 1873, rent \$2,750, in 1889 \$2,000; 261 Pearl street in 1873 rented for \$3,640, now \$2,400;

99 Pearl street, running through to Stone street, in 1873 rented for \$3,900, in 1889 \$1,860; 125 Pearl street, which 597

runs through to Beaver, a building about 80 feet deep, a short block of stores on Pearl street, rent-for \$600 a year, and the stores on Beaver street for \$1,200, the same depth of stores. One building divided in the center with a wooden partition to make two stores. The rents formerly were higher on Pearl street, and less on Beaver; 160 Pearl street, north of Wall, in 1873, rent \$4,500; in 1889 \$2,650; 280 Pearl street, in 1873 \$2,200, now \$1,600.

Q. That is so far as Pearl street is concerned?

A. Yes, sir.
Q. Will you please state to the jury whether or not in the vicinity of Pearl street, away on streets off from the elevated railway, or on streets over which the elevated railway does not cross, there is not now as compared with 1873, or as compared with 1877 or 1878, either one, a general advance in real estate values, and rental values?

A. There has been an advance, especially downtown, where this Pearl street is situated-a great advance over 1873 prices, which will vary from 25 to 331 per cent., and there are cases where it is

50 per cent. higher.

Q. Does that advance on streets over which the elevated road does not run in this vicinity also apply to the advance in rental

values?

598

A. The rental value has not advanced as fast as the advance in the fee, for the reason that in 1880 the law in New York was changed, reducing the rate of interest from 7 to 6 per cent., which reduced the rate of interest that a man has on his building when rented.

Q. Is it the universal rule in that part of the city, as you have stated it, that advances since 1873 to the present time are from 25

to 33 per cent.?

A. Yes, sir; outside of railroad streets.

Q. To what do you attribute the change in the character of the tenants on Pearl street, the depreciation in the salable value of property on Pearl street, and the depreciation in the rents on Pearl street that you have related?

A. To the construction and operation of the elevated railway. Q. Is there any other reason that applies to Pearl street?

A. None that I know of, sir.

Q. Do you know where the cotton business went to from there? A. The cotton business in about 1872 went to the lower side of Hanover square. It then moved in about 1885 to their new building on the north side of Hanover square where the street is 150 feet wide and the elevated railroad is certainly over 100 feet from it.

Q. Go on up the street, can you tell anything of the effect of the elevated railroad above on the same line, the Third Avenue line.

say in the Bowery part?

A. The Bowery proper, just where the Bowery commences, the north end of Chatham square is covered over within seven feet of the houses on each side of the street. The posts are set on the curbstone, a part of the uptown track and the downtown track over the walk and over the roadway at the lower end of this structure, which covers the whole street. There are only two tracks outside, and in the center are the station buildings and the platform; about 125 feet north of that there is a clear platform and two more tracks which are in view on either side of the structure. That is where

they send trains out, from the Chatham Square pocket. I know one piece of property, No. 13 Bowery, which rented for \$5,600, which has been sold within a year and a half or two years for \$32,500, which was rented for \$2,500 at that time,

The owner refused, before the road came, \$57,000 for it.

Q. Up the street—can you give us any information further on

that line of railroad, along up the street?

A. No. 75 Bowery was rented for \$6,500. It now rents for \$4,200. That is a four-story store used as a carpet store. The tenant says he will not take a new lease, even at \$4,200, when his lease expires.

Q. Does he give any reason?

A. He does. Q. What?

A. The structure in the street throws a shadow on his building in the afternoon, takes away the light. The running of the trains makes a great deal of noise. Cinders are thrown into the building, steam and smoke, and the flickering light caused by the passing of trains. A man examining carpets has to have a perfect light, and they stop when the trains pass.

Q. At this point, does the structure span the roadway?

A. No, sir, there are only two tracks there. The posts set on the curbstone, partly over the sidewalk and partly over the roadway.

Q. What is the width at that point?

A. I suppose at that point probably 80 feet wide, and lower down, at No. 12 Bowery, it is only about 70 feet wide.

Q. At this point, at the carpet store, the street is 80 feet wide, and there are but two tracks of the elevated structure?

A. Yes, sir. No. 218 Bowery rented in 1871 and 1872 for \$5,400. It rents now for \$3,200. The same property was sold in 1871 to William B. Astor for \$45,000. He sold it in 1890 for \$39,000. 600

Q. How wide is the street there?

A. 110 to 115 feet wide.

Q. How many tracks?

A. Two. No. 108 Bowery rented in 1873 for \$9,500. It rents now for \$5,700.

Q. How wide is the street there?

A. I suppose the street there is probably 80 to 90 feet wide.

Q. How many tracks?

A. Two. No. 309 Bowery, just before the road was built, rented for \$1,800. It rents now for \$1,200.

Q. How wide is the street?

A. About 110 to 115. Q. How many tracks?

A. Two. No. 166 Bowery rented for \$4,800, now rents for \$3,200.

Q. The street is about the same width and the same number of tracks as before stated?

A. About the same. No. 21 Bowery rented in 1872 for \$5,000.

It rents now for \$3,000 and taxes.

Q. The width of the street and the number of tracks?

A. That is where it is covered over within seven feet of the house line. That is about an average of the Bowery. No. 36 Bowery, in 1874, rented for \$3,500. In 1889, \$2,200. It is covered over with four tracks, and there are no structures on the tracks, no buildings opposite this house.

Q. How high is the track there in the clear from the roadway,

all along the Bowery?

A. I suppose it is about 21 feet in the clear.

Q. It has about the same effect following along the line of the elevated road, as you have stated, up Pearl street and

up the Bowery on that Third Avenue line?

A. No; when you get north of First street, Third avenue commences. It is so on the whole length of the Bowery, but on Third avenue, which commences at First street and runs north to One hundred and thirtieth street, the avenue there is 100 feet wide. The track is placed in the center of the street with posts in the roadway each side of the horse-car track, and there are two tracks in the center of the street.

Q. There is a highway for teams on each side of the elevated

structure uncovered?

A. Yes, sir,

Q. Has it affected the value of the property even there?

A. It has affected it. Property there has not got quite back to the 1873 prices, and has failed to appreciate with the adjacent property.

Q. It is not worth as much into how much as on parallel streets

of equal width?

A. In percentages the other streets are worth a third more.

Q. Do you know anything about how it has affected the value of

property used for residence purposes?

A. Fifty-third street from Sixth to Eighth avenues was a very good residence street. In 1875, I know a party who bought a house there for \$25,000; they rented it for \$1,700. When the road ran there in 1878 the party moved out. The owner attempted to rent the house, and the highest offer she ever had was \$1,000 a year. She has lived in it herself. I have had it for sale for \$15,000, and the best offer I have had is \$14,000.

Q. What is the reason?

602 A. The reason is the elevated railroad.

Q. How wide is the street at that point?

A. Sixty feet wide.

Q. How many tracks in the street?

A. Two,

Q. We will come down to the west side of New York. The elevated road on the west side runs through what streets?

A. Greenwich street and Church street, College place and West

Broadway and South Fifth avenue.

Q. Can you tell us anything of the influence on rentals and the

value of fees in that portion of New York?

A. West of Broadway there has been a large appreciation in real estate value. On Greenwich street the prices have not got back to 1873. Further along, they have done a little better, the obstruction is not so great.

Q. What is the difference between the values on Greenwich street, where the elevated road runs, and the parallel streets where no ele-

vated structure runs?

A. Below Courtland street, for example, the property on Greenwich street has not got back to its old price, whereas lots on Washington street, about 200 feet west, where they sold for \$12,000 in 1873, sell for \$20,000 now.

Q. There is an advance on the west side of Broadway, a general advance. Does this compare favorably with the other advance, the

illustration you have given?

A. Yes, sir.

Q. Except on the streets where the elevated structures are?

A. Yes, sir.

Q. Do they have the same class of tenants that they had before the structure was put there, or the same class of tenants as upon streets where there is no elevated structure now?

A. They have not as good rent, good paying people.

Q. Nor as permanent people?

A. No, sir.

Q. Have you any illustrations of that on that side of Greenwich

street, or Church street?

A. The southeast corner of Rector and Greenwich streets the property in 1875 sold for \$26,000. The same property was bought in 1885 by the elevated railroad for \$22,000. In 1870, 160 Greenwich street, lot 26 by 65, with an old-fashioned two-and-a-half story house on it, sold for \$22,500. In 1887, the same man bought the building next door but one, with a lot 25 by 100, with a five-story frame and brick building on the front, and a four-story on the rear, for \$20,000.

Q. And that after the increase that you have referred to had taken

place in 1885?

A. Yes, sir; in 1887, after the building of the road. The southwest corner store on Greenwich, a piece of property, sold for \$50,000 in 1870, in 1886 \$48,250. It has not got back. No. 109 Greenwich street, sold in 1873 for \$17,800. That had an old two-and-a-half story house which was torn down afterwards. No. 80, same street, lot 24 by 100, almost as large, a four-story brick factory, sold for

\$17,600 in 1886. 167½ Greenwich street, just before the road was built, rented for \$1,500; in 1884 it was rented for \$900, and is rented for that since. 158 Greenwich street rented in 1872 and 1873 for \$2,000, which rents now for \$1,104.

Q. Now, Mr. Martine, you have given these illustrations; you are familiar with the real estate on all these streets, are you, where the

elevated railroad goes?

A. Yes, sir.

604

Q. What have you to say as to the universal lesson of the effect upon property in the city of New York by the passage of the elevated railroad, business or other property?

A. It is detrimental.

Q. What does it do as to values?

A. Depreciates values.

Q. What, in the matter of renting, is the case as you know of finding ready tenants?

A. You cannot get as good rents, and you cannot rent as regu-

larly and to as good tenants.

Q. And the complaint is the elevated road?

A. The very fact of its being there they make an objection to.

Q. What effect does it have also upon Greenwich street with the light?

A. It takes away the light.

Q. Does the structure affect the light?

A. The structure itself takes away the light, absorbs more or less. It is wet under the tracks, the streets are generally wet, and the drippings from the tracks are objectionable. The passing of trains takes away the light.

Q. Do the trains throw cinders, even burning anthracite coal?

A. They do.

A JUROR: What do you mean by the drippings?

A. Especially in winter time after a snowstorm; the tracks are saturated with grease, and when it snows it lays there, and when it thaws you cannot pass under there without an umbrella. If you do you will ruin your clothing.

Q. What is the effect of the dripping of such things upon cleanly

business?

A. It is an objection to anybody who has a first-class trade.

Q. Of any kind?

A. Yes, sir; in fact in trade people object to it.

Q. To what extent is the flowing of steam from the locomotives

an objection?

A. The fact is, on a clear day it carries it straight up and gets between the sun and the house and casts a shadow, and the light flickers, and you cannot work if you are writing. In a cloudy day, or dull weather, the smoke will go down between them and pass up the track and get into the windows of the house.

Q. The entry of steam is a very great objection in a business

house, is it not?

A. Considered so by the owners and tenants.

Q. To what extent does the smoke injure the tenants in the build-

A. It sometimes carries gases with it from the engines which are

Q. With the smoke and soot and cinders?

A. Cinders go with it.

Q. Have they succeeded in any way, in the city of New York, in running passenger trains on the streets, preventing smoke and soot?

A. Not that I can see. Q. You see it every day?

A. Yes, sir; it is the universal complaint against the elevated structure, one of the complaints.

Q. Although they burn anthracite coal?

A. Yes, sir.

Q. I don't remember if you had anything to do with that building, still you may have had, in which the American Bank 606 Note Company did business, on a street west of Broadway?

I was a witness there in two suits they had against the elevated railroad, where they got two judgments of about \$120,000 altogether.

Q. Let me see about that.

A. It is on Church street, which is a street parallel to Broadway, directly back of Trinity church; the two railroads in front, the Sixth Avenue and the Greenwich Street.

Q. How many tracks?

A. I think there are three in Church street and four in Greenwich.

Q. Where was the American Bank Note Company's institution? A. On the west side of Church street, running through to the east side of Greenwich, a large five-story building, 120 by 150 feet deep.

Q. There were two railroads that used the tracks on Church street?

A. No, there are two roads, one on Church and one on Green-The Sixth Avenue road runs on Church street.

Q. How many tracks did the Sixth Avenue have along there by the American Bank Note Company?

A. I noticed three, and I think it has four.

Q. What was the complaint of the American Bank Note Com-

pany?

A. The bank note company complained of the loss of light and the flickering light, and the damage caused by cinders. Their witnesses testified that in engraving a plate they wiped it off with a

soft cloth once in awhile, and many times cinders have been 607 on the plate, and when wiping it off it scratches the whole

length of the plate, that has to be hammered on the underside, and in one case they testified it took a man four hours to make the plate perfect again. They also claimed that their numbering machines would clog with cinders and many times spoiled a note, which was finished all but the number.

Q. That came from the elevated road?

A. Yes, sir.

Q. And they claimed also that it obstructed their light?

A. Yes, sir.

Q. Although it was a seven-story building, and this ran by the

A. It ran a little above the second story. The first story is low.

Q. Do you know about the case?

A. I was a witness in both cases for the owners.

Q. Did they own the building?

A. They owned the building. That was for the damage to the fee.

Q. How much?

A. They got \$75,000 in one case and \$62,000 in the other. A portion of it was for the damage to the machinery and for this work that I have spoken of.

O. Was it shown also that the steam entered the building?

A. It was.

Q. Do you know anything about any other special cases where

smoke, cinders and steam had injured business?

A. The old firm of Willis & Company, 309 Pearl street, dealers in hides and leather, commenced a suit against the road, and they proved that the warm cinders came in there and got on the leather and made a spot, and they had to sell the hides as seconds; could not sell them as firsts.

Q. That was where the Pearl Street road run that you have spoken of?

A. Yes, sir.

608

Q. Having been born in New York, and in active business, I suppose you are pretty familiar with the entrance of the railroads into New York?

A. Yes, sir.

Q. And within the last ten years, I believe, New York has swarmed up the island pretty well, so that it is pretty densely populated?

A. It is. It has crossed the Harlem river. Q. Pretty dense population in Harlem now?

A. Yes, sir.

Q. Do you know how the New York Central comes down to the terminal facilities by which it reaches this depot?

A. I do. It comes from the Hudson river and strikes Fourth

avenue at the Harlem river, at One hundred and thirtieth street. Q. From Harlem river how does it come down?

A. For a couple of blocks there is a stone wall, and it drops into an open cut, down till you get to One hundred and sixteenth street, and from there it runs on a stone viaduct.

Q. How high?

609

A. Commences about five feet high, and runs 38 or 40 feet high, until you get about One hundred and first street, and then from there it goes into an open cut, and at Ninety-sixth street strikes the tunnel, and runs under ground until it gets to Fiftieth street, and

then goes into an open cut.

Q. For a distance it runs on a viaduct; how high does it run?

- A. The highest part is at the lowest end, One hundred and first street, about 38 or 40 feet high.
 - Q. How is that constructed? A. That is built of masonry.

Q. On piers?

A. No, solid masonry, with openings in the street to drive through, where it is high enough.

Q. All the streets pass under it?

A. Yes, sir.

Q. That comes down Fourth avenue?

A. Yes, sir.

- Q. How wide is Fourth avenue?
- A. One hundred and forty feet wide. Q. How wide is this superstructure?

A. A little less than 60 feet wide.Q. So that it leaves 80 feet roadway?

A. Roadway and sidewalk. The sidewalk is about 12 feet wide. Q. It leaves a roadway and sidewalk on each side of the street?

A. Yes, sir.

Q. Over which the New York Central trains pass?
A. The New York Central, Harlem and New Haven.

Q. What effect has that had on Fourth avenue?

- A. It has destroyed it completely, so much so that instead of facing the lots on the avenue they are faced on the cross-streets running east and west.
- Q. Is the population all about there, away from Fourth avenue, dense?

A. Yes, sir.

Q. What is the value as compared with the value upon parallel streets where there is no viaduct?

A. The value is much higher on the other avenue.

Q. This is not utilized at all?

A. I think between One hundred and first and One hundred and fifteenth there may be six or seven houses that front on the avenue.

- Q. This viaduet along Fourth avenue that you have told of, does that obstruct the passage of teams under it on the cross-streets at all?
 - A. With a few exceptions; when it comes down low it does.

Q. I speak of where it is high.

A. You take it up to One hundred and first street and to One hundred and thirteenth street you can drive under it.

Q. The streets are open under it and a passage for teams, so that

it leaves 80 feet right of way?

- A. Yes, sir; right of way and side track; the side track is about 12 feet.
 - Q. And a passage for teams without any covered way over?

A. On each side of the viaduct there is. Q. Why should they not build there?

A. As I say, they have turned the lots around on account of the viaduct being there. It is the usual custom for lots, on what we call an ordinary avenue, 100 feet wide, to be worth 50 per cent. more than the street lots, but in this case they are worth just about

what the street lots are. They are assessed by the authorities the same as the street lots.

Q. Can't they get manufacturers in there to run side tracks from this elevated viaduct; is not that property good for a manufacturing avenue?

A. It would if they could get permission from the board 611 of alderman to cross the avenue.

Q. They have not attempted it up there?

A. Not to my knowledge. It has been that way a great many years.

Q. Do you know of any place where, from an elevated railroad,

a side track is run in anywhere?

A. The only place where a side track is run in is where they own their own property and store their own cars. That is the only place I know of.

Q. You don't know of any being used from an elevated part of

any structure for private business?

A. I don't know of any; in fact I would know if there were one. Q. Did you ever have anything to do with a planing mill?

A. I did.

Q. Tell the jury what you know about it?

A. On Fifty-third street my father owned land which he sold to a man for \$95,000 before the road was built in the street. There was a factory put on there which cost \$40,000 to build. My father bought the property in under a foreclosure after the road came there for \$60,000. After my father's death my brothers and I sold the property for \$75,000 or \$78,000.

Q. Including the mill?

A. Yes, sir, and the engine and boiler and a little machinery. Q. Do you know about the planing mill, have you been through it?

A. I have. I rented it as agent for my father and as 612 owner.

Q. Does it have anything to do with its value, the running of the elevated road there?

A. It depreciated its value.

Q. Have you been through the Backus planing mill?

A. I have.

Q. Have you been in any other planing mills except the one you have spoken of and the Backus planing mill?

A. I have not here, but I have in New York.

Q. You know something of them?

A. I do.

Q. Have you gone very thoroughly through the Backus mill?

A. I have.

Q. What have you to say as to what kind of plant it is?

A. I think it is the finest place of the kind I ever saw—the most complete. The machinery is labor-saving and everything.

Q. Well equipped for doing the finest work?

A. I should judge so from the work I saw turned out.

Q. This fine work, such as they do for decorations and fine panel-

work, and that sort of thing, what do you think the effect would be if it had spots on it of any kind?

A. It would be a damage to it?

Q. Suppose the soot, such as you speak of as coming in from the elevated road, should get into their fine machinery?

A. It would clog and injure their machinery in some way and

stain their wood.

Q. Scratch it? A. Yes, sir.

Q. Upon highly seasoned wood that is being worked by this fine machinery that you see in that shape, what do you think the effect would be of steam and soot and cinders pouring in upon this work?

A. It would certainly make them liable to burn up oftener; it

would raise their fire-insurance rates, it would be a risk.

Q. What effect would it have upon their fine work to have soot and cinders?

A. It would be a damage to it.

Q. And steam?
A. Steam also.

Q. Liable to stain it, would it not?

A. It would.

Q. With your knowledge of handling a planing mill in New York, suppose, instead of an elevated structure, such as they have in New York for passengers, there should pass by the Backus property an elevated structure, 13 or 14 feet in the clear, spanning the entire roadway, that you see there, from curb to curb, having upon it three tracks with a place in front to switch also, and with a viaduct still beyond the roadway for teams, about 25 feet wide, with a solid roadway for teams, and suppose over this structure of three tracks, with the switches placed as I have stated, there should be drawn the railroad trains of four great trunk lines, with their locomotives, standard locomotives, not like those you see in New York, but the standard locomotive, such as you see coming over the New York Central, being the Canadian Pacific, the Wabash system, the Detroit, Lansing & Northern system and the Flint & Pere Marquette system, using these tracks also in front of the Backus property over this structure, for doing the entire local freight business for Detroit,

with those roads running the trains up to a freight depot beyond Backus' toward the city, what have you to say, in

your judgment, as to whether a successful planing-mill business, such as you see, equipped as Backus' is, as to whether it can be successfully carried on there, with such a structure in that proximity, and so conducted?

A. It would be only partially successful, it could not be carried on, in my judgment, in the proper manner to have it there with such a structure. A man who is there might stay there because he is forced to.

Q. You don't think any one would buy a mill and go into such a place?

A. Unless he could get it very cheap.

O. You know that in planing-mill business, and in all business competition is very close?

A. I know that, generally.

Q. If he could only make a partial success, and his margins are narrow, in competing with the planing mills of Chicago, Milwaukee, St. Paul, Indianapolis and Buffalo, do you think he could make a success if he only made a partial success?

A. It would not be what I should call a success; it would be un-

satisfactory.

Q. Don't you think the injury to his fine work, when he has established a reputation for making very fine work, in hard wood and soft wood, don't you think it would affect his trade?

A. It would, largely.

Q. And if he had to sell at a discount you don't think he would compete with mills of his own style?

A. No, I think the most profitable work he could do is this fine work, and he would have to do coarser work to keep it up.

Q. His mill is equipped for the finest work, is it not? 615 A. I should judge so.

Cross-examination by Mr. BAKER:

Q. You say you have lived in New York all your life?

Q. And your business is that of a real-estate agent?

A. Real-estate broker and appraiser my principal business, and agent.

Q. You are a real-estate broker and appraiser?

A. Yes, sir.

Q. And you are also a real-estate witness, are you not?

A. I am and have been in a great many cases.

Q. How many times have you testified in elevated-railroad cases in the city of New York?

A. I have testified in about 100.

Q. Haven't you testified in more cases than that? A. I don't think I have; it may be a few more.

Q. You have always been called by the property-owners?

A. Not always; the elevated railroad has tried very hard to get me as a witness, but I declined to go.

Q. Then you have always testified for the property-owners? A. Yes, sir.

Q. How much did the elevated road offer you to be a witness?

A. They did not offer me any price; they sent to me a man in their employ, a lawyer, came to me two or three times and suggested he could pay me as well as I was paid by the other side.

Q. What is this lawyer's name?

A. His name is Smith, I think J. something Smith.

Q. Where is his office? 616

A. I will not say positively, I think it is 167 Broadway.

Q. What is his first name?

A. If you mention to the company Flaxen-head Smith they will know the man.

Q. You don't know what his initials are?

A. I think his name is J. P. or J. B. Q. How many times did he see you?

A. He saw me three times, twice anyway.

Q. And he did not succeed in getting your services as a witness? A. No, sir.

Q. What did Mr. Backus agree to pay you to come out here and testify?

A. If I am obliged to tell I will tell.

Mr. Dickinson: Tell it.

A. My fee is \$500, and my expenses.

Q. You say you have a brother in New York who is an exjudge of the court of general sessions?

A. No, I say judge of the court of general sessions. Q. How was he appointed or elected judge?

A. He was elected by the largest majority on the ticket at the time he ran.

Q. He was elected?

A. Yes, sir.

Q. You never held any judicial position?

A. I did not, sir.

Q. You didn't run for judge when your brother did? A. No.

Q. What is the court of general sessions?

A. A criminal court.

Q. A police court? 617 A. No, sir, there is a police justice who sits at the police court.

Q. You say you have been employed by the city of New York?

A. I have, sir. Q. What to do?

A. As I have stated, to appraise land.

Q. In what kind of a case?

A. The first case was taking land for the new parks in the Twenty-third and Twenty-fourth wards.

Q. You were employed by the city as a witness?

A. I was employed by the corporation counsel as a real-estate broker to appraise that property, and to appear as a witness before the condemnation commissioners.

Q. You went and looked at the property and testified for the city?

A. Yes, sir.

Q. That is your principal business, is it not, giving testimony in this class of cases?

A. It is not; my principal business is selling real estate.

Q. Where is your office? A. No. 60 Liberty street.

Q. How long have you had an office at No. 60 Liberty street?

A. I have had an office there six years.

Q. A real-estate office?

A. Yes, sir.

Q. Where was your office before that?

A. 999 Sixth avenue.

Q. Near what street is that?

A. Near Fifty-fifth street.

Q. How long did you have an office there?

A. Four or five years. 618

Q. Before that where did you have an office?

A. Before that I had an office at 1339 Broadway, near Thirtyfifth street.

Q. How long did you have an office there?

A. About four years. The building was torn down and I moved away.

Q. Before that where did you have an office?

A. I had an office before that in Thirty-sixth street near Sixth avenue. Q. Did you do a real-estate business in all these offices?

A. Yes, sir. Q. Did you do any other business?

A. Appraising, insurance and renting houses.

Q. Were you ever in the soap business in New York?

A. I was in the soap business part of my time, way back in 1869.

Q. Down to what time?

A. About three years, but I was never out of the real-estate business. The soap business I went in at the solicitation of my father, who was in the business, and I saw there was no money in it and luckily I stuck to my real-estate business.

Q. You were in the soap business only a short time?

A. That is all.

Q. Your father was in that business before you?

Q. You at one time had something to do with a planing mill down there?

A. Fifty-third street.

Q. Who owned that planing mill?

A. When my father bought it it belonged to A. G. Serril &

Q. What did your father give for it? 619

A. He gave \$60,000.

Q. When did he buy it?

A. I don't remember the year now. It was 1874 or 1875; it may have been 1876.

Q. Your father bought it on a mortgage foreclosure?

A. He did.

Q. What number Fifty-third street is that planing mill?

A. I think it is about 206-'8-'10 and 12.

Q. Between what streets?

A. Between Broadway and Eighth avenue.

Q. Is that planing mill there now?

A. It is not a planing mill now; it is a furniture factory.

Q. Does the elevated road run in front of that property on Fiftythird street?

A. No; it runs on the side of it now, because they have made Broadway the front. It does not front on the elevated railroad.

Q. When your father bought it it fronted on Fifty-third street?

Q. How long had the elevated road been built there when your father bought it?

A. My father bought it before the road came.

Q. That is what I thought; you say the property cost \$95,000? A. I say my father sold the lots for \$95,000 to Mr. Serril. built the building at a cost of \$40,000.

Q. The property your father bought for \$60,000 originally cost

\$135,000 ?

A. A foreclosure sale is not a criterion.

Q. Is not that so; it originally cost \$135,000? A. Yes, sir.

620

Q. And your father bought it for \$60,000 before the elevated road was built?

A. His mortgage was \$60,000, and there were arrears of interest and taxes; I know it was way behind.

Q. How much did your father give for it?

A. I can't say.

Q. Have you not testified that your father gave \$60,000 for it?

A. I did so testify, and I wish to correct it.

Q. And didn't you give this jury to understand that it depreciated to that extent because of the building of an elevated railroad in front of it?

A. If I said so, I didn't mean to say so. As a matter of fact that depreciation took place before the elevated railroad was built. But I stated a foreclosure is no criterion of value. In dull times there are no buyers.

Q. That was sold during the hard times, when mortgages were

being foreclosed all over this country?

A. Yes, sir.

Q. What was it sold for subsequently?

A. \$75,000 or \$80,000.

Q. What year?

A. I think it was in 1883.

Q. When was the elevated road built in front of it in Fifty-third street?

A. In 1878.

Q. Who owned the property at that time? A. My father.

Q. How much damages did he receive from the elevated road?

A. He personally never received any.

621 Q. How much was paid by the elevated road on account of that property?

A. The elevated road paid the estate about \$5,300. The estate got that. I think the lawyer who had the claim got a percentage.

Q How much was the total amount that the elevated road paid for building their road in front of that property on Fifty-third street?

A. I say the estate got a little over \$5,000.

Q. How much did the lawyer get? A. I don't remember what he got.

Q. Did he get as much more?

A. Oh, no. He got probably 20 or 25 per cent. of the whole thing.

Q. He may have got \$1,000?

A. He may.

Q. How was the value fixed?

A. Fixed by the railroad making that offer, and its acceptance by the administrator. The lawyer had charge of it, and I had nothing to do with it.

Q. Were commissioners appointed?

Q. Was a jury impaneled?

A. The case never went to trial. Q. It was settled by the voluntary agreement of the parties at

about \$6,000?

A. All that I know about it is that my brother wrote me to come and see him and said the railroad had made an offer to settle, and I told him, to do what he thought best. I know he sent me a check for a portion of the money.

Q. As a matter of fact it was settled for something like \$6,000 in

the aggregate?

A. It was. Q. What did the property sell for?

A. I think it sold for somewhere in the neighborhood of \$75,000 or \$80,000.

Q. Your father paid \$60,000 and some accrued interest?

A. And taxes. Q. You don't know how much the aggregate was? A. No.

622

Q. How long did he hold it? A. He bought it in 1876 or 1877.

Q. When did you sell it?

A. Six or seven years afterward. Q. Did he run a planing mill in it?

A. He did not.

Q. Did he rent it? A. For the first year or so he did not.

Q. What did he do with it?

A. He allowed Mr. Serril to stay there for a while.

Q. What rent did the old owner pay for it?

A. He paid a merely nominal rent; I think it was \$1,200.

Q. Your father bought it for something over \$60,000, and allowed the owner to stay in it for two or three years?

A. Yes, sir; that was until he could get a tenant.

Q. Did he finally get a tenant? A. I finally leased the property.

Q. To whom?

A. George A. Shaster.

46 - 55

Q. How much rent did you get for it?

A. \$2,500.

Q. How long did he have it?

A. He staid there until 1883, when he bought it. Q. He carried on a successful business there?

623 A. I don't know; he is there yet; I don't know how successful he was.

Q. He bought the planing mill, paid the rent, and finally bought the property?

A. Yes, sir.

Q. Did he carry on a furniture factory there or a planing mill?

A. A furniture factory.

Q. And he is there vet?

A. Yes, sir.

Q. And he has bought property enough to carry him on to Broadway?

A. He runs through and into Broadway, and that is his front

now.

Q. Your father's estate has been paid ten per cent. on the cost of the property as damages?

A. Yes, sir.

Q. You say that you have known of canvas awnings being burned up along the line of the elevated road?

A. Yes, sir. Q. Do you know of any building being fired by the elevated road?

A. No; I don't think I do.

Q. How many miles of elevated road are there in New York? A. I suppose there must be 30 or 40-30 probably. Let me see (witness refers to paper). No, I will change that, because one road runs on the same track as another road; probably 20 to 25 miles.

Q. How long have those roads been in operation?

A. They commenced in the summer of 1878. The Second Avenue run a little later than that.

624 Q. They have been in operation about 13 years?

A. Thirteen years.

Q. How many miles have been in operation 13 years?

A. There is Sixth and Third avenues.

Q. There are 15 miles that have been in operation 13 years? A. Twelve, anyway.

Q. You have lived in New York all those years? A. Yes, sir.

Q. You have lived on the line of the elevated road?

A. I have.

Q. And you have ridden on the road?

A. I have.

Q. And you have been in the real-estate business all these years?

A. Yes, sir.

Q. Having to do with real estate, with the rental, and sale, and disposal of property, right along, daily, as a part of your business?

A. I have.

Q. Do you mean to tell this jury that, in all those years, with all that experience, you never heard of a building in New York being fired by the elevated road?

A. I don't know of one that has been set on fire by the elevated

road. Q. Pearl street was a street where the cotton men used to do business?

A. Below Wall street.

Q. Will you point out Pearl street on that map?

Witness does so.

Q. How long is Pearl street?

A. It commences on Broadway, and then goes to Thomas street and runs around like a horseshoe, and runs around 625 again there by the Battery.

Q. Is it below the East River bridge over to Brooklyn?

A. Yes, sir, it runs under that bridge.

Q. How far does it extend north or northeast of the bridge?

A. One block in the direct line, and then turns round to the west.

Q. It is one of the oldest business streets in New York?

A. Yes, sir.

Q. And at the lower end of the island?

A. A portion of it, the most of it is.

Q. The most of it, all but one block, is below the bridge?

A. All but one block runs in a straight line; that curves off Broadway; but there are many more blocks.

Q. Did the cotton men have a Cotton exchange down there on

Pearl street?

A. They did.

Q. Whereabouts was it?

A. Just below Wall street on the east side.

Q. Did they have a building there where they did business? A. They were in what was called the Carter & Hawley building.

Q. But that was not a separate edifice like the board of trade, or such a building as that?

A. No, sir, they only, at that time, occupied one floor.

Q. Have they since they were on Pearl street built a building for their own use?

A. Yes, sir.

626

Q. Whereabouts is it?

A. On the northeast side, the side towards Broadway, on Hanover square.

Q. They have built on Hanover square? A. Yes, sir, on Williams street and Beaver.

Q. Just point out Hanover square on there (the map).

The witness does so.

Q. Does Pearl street run into it?

A. Pearl street runs into it and through it, and continues on.

Q. So that the Cotton exchange is still located near Pearl?

A. Yes, sir.

Q. It is now located on a square through which Pearl street runs?

A. It is 100 feet or more away from the elevated railroad.

Q. That is, there is an open square there?

A. At the south end of the square it is about 160 feet wide, and they are 50 or 60 feet from the railroad.

Q. You have given us a large amount of testimony here as to what property rented for in 1873 on Pear's street. How did you

find out what it rented for?

A. I looked up the recorded leases; property I had on my book of sales, knowing the rental, cases I have been on, cases I have heard in court, and announcements made at public auctions of what property has been offered for sale at, and many other ways we have of finding out.

Q. How do you get it right down to the dollar all the time?

A. One hundred seventy-four and 176 I had to rent—no, I won't say to rent, I mean for sale, from the owner, and I verified it by seeing the tenants, and the rents of the other premises I got from the owner, Mr. Eno.

627 Q. How do you remember?

A. I don't remember, this book here is full of Pearl street.

Q. What book is that?

A. That is a compilation of my own. Q. What have you in that book?

A. I have got the sales and rentals on Pearl street.

Q. Have you all the property in New York in that book?
A. No, sir; New York is too large. This book contains the sales on Pearl street, at the different periods from 1872 down to

Q. Why Pearl street?

date.

A. Let me finish my answer. It contains sales on Water street, rents on Pearl street and rents on Water street. It contains sales on Pine street and cross-streets, showing the increased rental values and the increased sale values, and on cross-streets near Pearl street. Why I have it all on Pearl street so as to have all Pearl street in one book, is because I wanted it one place where I can get at it.

Q. What do you use that book for in your business?

A. In cases like this, or in cases where I have elevated-railroad suits on Pearl street, and I use it when I want to get at old values or make comparisons of present values.

Q. Is not that a book made up to use in cases in New York?

A. Yes, sir, I told you so.

Q. And you have paid particular attention to Pearl street, you have confined that book to Pearl street, and the cross-streets that cross it?

A. This book is confined to Pearl street, but I have many more that give other streets.

Q. Have you a book that applies to other parts of New York?

A. No, sir, but I hope to.

628 Q. Do you mean to say that you have been called in so many cases as a witness, that it has saved you time and labor to get up a book like that?

A. I do.

Q. And you have only been called in about 100 cases?

A. I have, in more than that, but that is all that has actually been tried. A great many of them have been settled. I give you the cases I have been actually on. Q. You testified about the Armitage building? A. Yes, sir.

Q. What is the number of that?

A. 87 and 89 Pearl street.

Q. Did you ever have that building to rent?

A. I didn't.

- Q. How did you find out that that building rented in 1873 for \$9,450?
- A. I heard the former owner, John Stewart, testify to it under oath.
 - Q. That is all you know about it?

A. And he told me himself.

Q. Is that all you know about it?

A. And I also have seen a list he made out, and have been told so by the owner, Mr. Wilcox.

Q. Your testimony as to that is entirely hearsay?

A. I heard a man testify under oath, and I believed him.

Q. But it is hearsay?

A. Yes, sir.

- Q. How did you find out that in 1888 that only rented for \$5,415.
- A. At that time I went through the building and found that out from asking the tenants, and saw the book of the 629 owner, and heard him testify to it.

Q. So that was entirely hearsay?

A. You can call it that if you want to. That is the way I got it.

Q. Did you hear him testify in 1888?

- A. No, sir; I think his case was in 1887. How could he testify Q. You think it was in 1887 he testified. in 1887 what the rent was in 1888?
- A. I said 1887 to 1888. Leases are made from May to May, the

Q. So that you got that information in a case?

A. Yes, sir.

Q. Were you a witness in that case?

A. I was.

Q. What was that property worth in 1887 and 1888?

A. In the neighborhood of \$50,000.

Q. \$50,000.

A. In the neighborhood of that, I say.

630

Q. Was this case that you tried before commissioners?

A. No, sir; it was before a court and jury.

Q. Where the property-owner brought an action against the elevated road?

A. Yes, sir.

Q. The property was worth at that time \$50,000?

A. I say about that.

Q. What was the verdict?

A. He sued for a loss of rent, and I think he got \$13,000; that was for six years.

Q. That covered the back rent and future damages?

A. Oh, no, sir; five or six years' back rent.

Q. Is that all?

Q. In those cases that are brought down there, where they recover for back rent, it is for a loss that has already taken place?

A. Yes, sir.

Q. And in the same suit don't they recover the damages for the future?

A. There was a time the railroad would do that, but very rarely. They hang onto all their money as long as they can.

Q. Did they ever commence suit against the railroad company for the future damages?

A. I don't know.

Q. Do you really know what was tried in that case—whether it was past or future damages?

A. It was past damages.

Q. You know that past damages were involved?

A. It was the loss of rental only.

Q. Have you any real opinion as to whether or not that included in the damages that were recovered all the damages that they could ever recover against the company?

A. No; I know to the contrary that rental damages are tried before juries; fee damages are tried in the equity part without a

jury.

Q. Has there ever been a case in regard to that property since?

A. Not to my knowledge.

Q. You don't know that the owner ever sued afterwards?

A. No, sir, I don't.

Q. What was that property worth in 1873?

A. I suppose that property in 1873 was worth about \$75,000 to \$80.000.

Q. To what extent did the flush times that followed the war, or the inflation of prices that was involved in a depreciated currency, affect that price?

A. Well, in the business property about 25 per cent.

Q. There was a panic in New York in September, 1873, I believe?

A. Yes, sir.

O. It depreciated values in New York for four or five years afterwards, didn't it?

A. Yes, sir; down to about 1877.

Q. And it depreciated rentals in New York for about four or five vears?

A. It did.

Q. This case was tried in 1887 or 1888?

A. Yes, sir.

Q. Did you testify in that case that all this depreciation was oc-

casioned by the elevated road?

A. I don't remember now what I testified. I am free to say this. that I testified not the way you put it, but I testified that that property would be worth more than it was in 1873 but for the elevated road: that is what I said.

O. How close did the elevated road run to that building? A. Probably eight feet, maybe nine, eight or nine feet.

Q. Near what streets or between what streets is this Armitage building?

A. Between the Coenties slip and the Old slip.

Q. How far from the corner? A. About the center of the block.

Q. How much frontage has this building on the street?

A. Forty-five feet two inches.

Q. How wide is the street in front of the Armitage build-632 ing?

A. About 50 feet.

Q. How wide is the sidewalk?

A. I think the sidewalks are probably four and a half to five. Q. Is the elevated road at that point on the curb, the posts?

A. Yes, sir.

Q. Is the entire roadway spanned?

A. It is in that block, with the outside of the track about three feet outside of that, with up and down town rails, but Mr. Wilcox got an injunction against the railroad and they had to cut it out of his road.

Q. So that they have two tracks, one on each side of the superstructure?

A. Yes, sir.

Q. Is there any open space between the two tracks?

A. No, sir; it is planked there. Q. It is planked over entirely?

A. No, sir; but between the two rails where the car runs there is simply cross-ties and timbers that keep the cars from going off the track, but between the north and south bound tracks there are planks with about an inch space between them.

Q. That is, there is planking that occupies space between the two

tracks, with openings of about an inch between each plank?

A. Probably about that.

Q. Foot plank, or about that?

A. No, sir; about six inches wide probably.

Q. How far between the tracks; how long are those planks?

633 A. Those planks run lengthwise with the railroad track.

Q. About how wide a space do they occupy there between the two tracks, not between the rails, but between the two tracks?

- A. Between four and five feet, I suppose, between the two rails, I mean between the west rail uptown track and the east rail downtown track.
 - Q. There is space between them?

A. Yes, sir.

Q. And that is planked over?

A. Yes, sir.

Q. Is it planked or covered in any way between the rails?

A. I think there it is only the cross-ties.

Q. Are there any shields or pans that run along there to catch
the drippings?

A. I don't think there are any there.

Q. How high is it at that point in the clear?

A. J think 20 or 21 feet, or maybe 22.

Q. That is, from the under side of the girder to the street?

A. Somewhere about 20 feet. I never measured it.

Q. Have you never measured these heights anywheres?
A. No; but I have heard them testified to by the civil engineer of the elevated road; a man I know personally, and I know his measurements are correct.

Q. You know his testimony is correct?

A. As to measurements. Q. What is his name?

A. Reeves.

Q. He is the engineer of the elevated road?

A. No, sir; he is a young man who is a civil engineer; he does this kind of work and draws plans for them.

634 Q. He is in the engineer's office?
A. I don't know where his office is.

Q. You have heard him testify?

A. I have.

Q. Did you ever hear any question raised in any of your cases down there about the height of it?

A. In what way?

Q. Was the testimony of the officers of the company disputed at all, or of the engineers, as to how high it was?

A. There have been some disputes about it. Q. You have heard controversies about it?

A. I have.

Q. But you are willing in your testimony to take the testimony of this young man as to the height of it?

A. I say he is about right, yes, sir.

Q. Do you know what the height of the elevated road is between the under side of the girder and the top of the rail on which the cars run, as a usual thing?

A. I should think between 4 and 5 feet, probably near 4; I am

not certain.

Q. Which line is it that runs on Pearl street?

A. Both lines; Second and Third avenues.

Q. How near is what is called the Old slip to the Armitage building?

A. (Referring to paper.) Probably 130 or 135 feet.

Q. Is the elevated road at the Old slip the same height as it is at the Armitage building?

A. I think about the same, without measuring it.

O. And you think that is about 20 feet?

A. It may be a little higher there, because I know there is a double stairway there from the Hanover Square station.

(). There are plenty of places in New York where the elevated

road is not more than 14 or 15 feet high?

A. I think there are a few cases. I think there is one at about Twenty-eighth street on Second avenue, and that there is one at One hundred and fourth street and Ninth avenue.

Q. This man Reeves that you refer to is a civil engineer in the

service of the company?

A. So he says.

Q. He is a man of truth and veracity?

A. I believe him.

Q. (Showing paper.) Is that his signature?
A. I don't know his signature; I never saw it.

Q. Where does he live?

A. I don't know.

O. Does he have an office at 71 Broadway?

A. I think his office is the office of the company, at 71 Broadway.

Q. (Showing paper.) Will you look at that statement of the heights of the Second Avenue line at the different street crossings, and see whether it is correct according to your observation and judgment; you will notice by the head there that that is from the top of the tie, from the top of the rail to the top of the street; it includes the superstructure?

A. Well, the lowest here is 18 feet 1 inch.

Q. But that includes the four or five feet that are in the super-

A. With 34 feet it is 39 feet 8 inches, so that the average would

be nearer my figures.

Q. I don't ask you what the average is, but if you desire to state it I have no objection.

A. I don't want to state any average, but I see it is generally

higher.

636 Q. It is generally higher than 14 feet; but there are plenty of places in New York where it is not more than 14 feet in the clear?

A. I won't say there are plenty.

Q. There are a number.

A. You have not one on this list that is 14 feet.

Q. Yes, you have. How deep is the superstructure between the bottom of the girder and the top of the tie?

A. The lowest you have got here is 15 feet 5.

Q. But you make no deduction there; just look at the head line there?

A. Yes; from the top of the tie.

Q. You would have to take off four or five feet for the girders and ties, would you not, for each one of those?

A. It may be; I don't know; it may be only three feet; I never measured those girders.

Q. It is somewheres from three to five feet?

A. You cannot be accurate in looking up, as to figures; if you are on a level with it you can; I never measured those heights; I have looked at them with my eye.

Q. Certainly; you just give the judgment that any ordinary man will give as to the heights of it, as far as your testimony is based on

your own knowledge.

Mr. Baker then shows witness a diagram and asks:

Q. Would you say that that was a correct representation of the

superstructure on Pearl street?

A. It fairly well represents it; I don't know that it has this extra business inside here, I don't remember about that; it looks more ornamental there than it really is.

Q. That is, you think this is a handsomer structure than the

thing is in reality?

A. You cannot see the superstructure that way, because you are at the end.

Q. If you were a builder or had had some experience with drafting, you could judge pretty well from this, could you not?

A. Yes, sir, but as I say, you cannot see that in reality; that is

drawn from the end.

Q. This merely represents a cross-section of it? A. Yes, sir.

637

Q. And it shows that the distance between the posts is 25 feet?

A. Yes, sir.
Q. And it shows that the distance from the posts to the lot line is eight feet and three inches on each side?

A. Yes, sir.

Q. And it shows that the superstructure, not including the 20inch plate, if that means 20 inches, is three feet and six inches?

A. Three feet and six inches is there, but I think that includes these heavy girders, one foot high, which are laid each side of the track to keep the cars from running off.

Q. You think three feet six inches includes the bond timber on

the end there?

A. I cannot say.

Q. But it is marked there.

A. I didn't make that. I cannot tell you anything about it.

Mr. Baker shows the witness another diagram, and asks:

Q. Does the next map I show you represent the elevated road on the Bowery?

A. What part of the Bowery?

Q. Is there any elevated road in New York that is built on a row of single posts like that?

A. Yes, sir, the upper part of the Bowery. 638

Counsel shows another diagram.

Q. Is there any elevated road on Third avenue built like that?

A. That is about it, yes, sir.

Q. You have referred to Church street in your testimony?

A. I did.

Q. (Showing another diagram.) Is there any elevated road on that street built like that?

A. I won't say positively; it looks like it.

Q. Is there any elevated road on West Broadway built like that (showing another diagram)?

A. It looks something like it, only there is more of it than there

is there.

Q. Of course; this is simply a cross-section.

A. But it does not show the street as it really is.

Q. Why?

A. Because on top of that you have got from Franklin street to Chambers street four tracks planked over solid, covering almost the entire roadway. You take the tracks off, take the boards and ties off, and that will look like one section of the elevated road.

Q. That is, that will look like a cross-section of it?

A. That looks like it when they first commenced to build it and got two posts and a girder across.

Q. Does it not represent it as it now is?

A. No, sir, because if you had two sections, and light and shade, you would have it so dark underneath you could not tell it so well. Q. What makes it so dark underneath?

A. The covering over the track with boards and ties.

Q. Do you mean to say the elevated road in New York is 639 all planked over?

A. I didn't say so. I speak of West Broadway, where you spoke of. I said from Chambers up to Franklin street there was four tracks, and almost the entire roadway was covered with boards and ties and tracks.

Q. This represents a part of West Broadway, where there are

only two tracks?

A. No, sir; because the further north you get, and above Franklin street, the street is wider in every way, with wider and heavier girders.

Q. I say this represents a part of West Broadway, where there

are only two tracks.

A. You don't show here the two girders north and south, that fit into it.

Q. Yes, there is a longitudi al girder there. Does it represent a portion of West Broadway, where there are only two tracks?

A. It represents two posts and one girder; that is all it represents; it does not represent anything else.

Q. But does it not show a cross-section of the elevated road where there are only two tracks?

A. It represents two posts with a girder on them.

Q. And two tracks?

A. I suppose there is a track on top of the girder.
Q. Why didn't you answer it in that way at first?

A. I did answer it.

Q. What made you hesitate so long before answering it?

A. I didn't hesitate at all.

Q. Does not that show a cross-section of the elevated road where there are only two tracks?

A. I know that is a picture that does not represent as it actually looks; it is a fact that it represents two posts and a cross-girder.

Q. And a section of it where there are only two tracks?

A. The way it is drawn there, what I mean to convey is this, that the picture and the fact are two different things.

Q. You do not have to tell us that.

A. I want you to know how it is.
Q. (Showing another diagram.) Does the map I now show you show the elevated road in any part of 53d street?

A. It looks like it.

Q. And is that the way it was built by your father's planing mill?

A. No.

Q. How was it built there?

A. The track widened out, I think there; it went nearer the sidewalk; they got switches in below between the planing mill and Eighth avenue.

Mr. Dickinson: Switches for freight or for the accommodation

of passengers?

A. Switches for the accommodation of passengers, and then they had this baggage car for the Northern railroad standing there.

A Juron: Does the baggage car you speak of stand in front of your father's shop?

A. No, sir, it stands near Eighth avenue. Mr. Baker: How wide is Greenwich street?

A. It varies like the rest of them; it varies from 50 feet to 67 feet.

Q. How many tracks are there in Greenwich street?

A. There are four tracks from Battery place, which is the lower end of Greenwich street, to almost Courtlandt street above Liberty, a street south of Courtlandt.

Q. So that quite a good portion of Greenwich street has four tracks?

A. Yes, sir.

Q. And it is all planked over?

A. It is

Q. And it has quite a serious effect upon the light?

A. Yes, sir.

Q. In this case that involved the Armitage building, did you testify that the fire risk was increased on that property?

A. I have no recollection of it.

Q. Did you in any of your cases in New York, testify that the fire risk was increased?

A. I don't think I did.

Q. Not in all the hundred or more cases that you have testified in, you have not testified in a single case that the fire risk was increased by the elevated road?

A. No, sir, I don't volunteer any testimony. When I am put

upon the witness stand I answer what the counsel ask.

Mr. Dickinson: Were you asked about it at all?

A. No, sir.

Q. Are you an insurance man?

A. No, sir; I don't know anything about it. Mr. Baker: You are a real-estate man?

A. Yes, sir.

Q. You insure a great deal of property?

A. Not much.

Q. Didn't you testify that you did insurance business?

A. You asked me away back. I did do insurance a few years ago.

Q. When you speak of a man's accomplishments, and he was in the insurance business away back, you expect him to know something about it?

A. You can forget a good deal in a few years.

Mr. Dickinson: At all events you were asked about the increase of the fire rates?

A. No, sir.

Mr. Baker: Although you have been right in the business of giving this testimony and have been on the stand in all these cases, you have not given any testimony on that?

A. I have not been asked about that.

Q. You say that the property at 173 Pearl street rented for \$3,000 in 1873, and in 1891 for \$1,800.

A. Yes, sir.

Q. What was that property used for in 1873?

A. I don't know what it was used for. It is used for mercantile business; I don't know the particular business.

Q. Was Pearl street at that time a retail street?

A. No, sir; never.

Q. Was it a wholesale street?

A. It was always a wholesale street.

Q. Is it a wholesale street now?

A. There is odds and ends there now of different kinds, some wholesale and some retail.

Q. There have been some very radical changes taken place in the location of business in New York?

A. There have been changes.

Q. They are wholly independent of the elevated road?

A. Yes, sir.

Mr. Dickinson: The retail business is not coming downtown?

- A. No, sir; the retail business has fallen away in Pearl
- Mr. BAKER: Is there any retail business in Pearl street 643 now?
 - A. There is some.
 - Q. What kind?
- A. There is stationers to supply the people there; and there are restaurants, lunch-rooms and retail stores; I don't mean to say dry goods retail, or clothing, or anything of that kind.
 - Q. It is in the wholesale part of the city of New York?
- A. Yes, sir, except Fulton street, running to near the East river, is more a retail street.
- Q. What is this particular property, 173 Pearl street, used for now?
 - A. Occupied by a man who makes tin cans and tea-caddies.
 - Q. You don't know what it was used for in 1873?
- A. No, sir; I know the present tenant has been there a great many years.
 - Q. How did you find out what it brought in 1873?
- A. I am acquainted with the agent who has charge of the property, and he showed me the leases that he made out.
 - Q. How did you find out what it rents for now? A. I saw the leases and I heard the tenant testify. Q. And it was a case in regard to that property?
- A. No, sir; the elevated road brought that man to testify that there was no damage to the property on Pearl street, and he so swore, and the agent of that property went on the stand and testified that this man constantly got his rent reduced on the ground
- that it was injuring his business and he could not stay there. 644 Q. Did the tenant in possession testify that the property along that street was not injured by the elevated road?
- A. He did and he did not. In this way, he testified on the direct examination that it was no damage to his business, but on the cross-examination he was asked if he did not tell the agent that it was a damage to his business, and he wanted his rent reduced, and he said, "Well, I think I did."
 - Q. He got his rent reduced? A. Yes, sir.

 - Mr. Dickinson: What business did he do?
 - A. He made tin cans.
 - Mr. Baker: He was there when the road was built?
 - A. I think he was.
 - Q. And he has been there ever since?
 - Yes, sir.
 - Q. What is the building 174 and 176 Pearl street used for now?
 - A. It is used as a restaurant and a store, and offices upstairs.
 - Q. What was it used for in 1873?
 - A. The same business exactly.
 - Q. What rent did they pay for it in 1873?
 - A. It rented for \$6,000.
 - Q. What do they pay for it now?

A. \$3,800 or \$3,900 I think I said.

Q. Has the same firm got it?

A. Oh, no; I don't think so. The rent now is \$3,800. Q. What is the property, 175 Pearl street, used for now?

A. It is used by a tobacco firm.

Q. A wholesale house?

A. A wholesale house.

Q. Leaf tobacco or fine-cut?

A. A wholesale house in tobacco, in cases and wrappers d other ways.

Q. What rent do they pay for it?

A. \$2,000 a year.

Q. Did the same firm have it in 1873?

A. Yes, sir.

5

Q. What rent did they pay then?

A. \$3,400.

Q. What is 179 Pearl street used for now?

A. I think the same kind of business that is in it—tobacco. Q. What was it used for in 1873?

A. I don't know.

Q. 182 Pearl street?

A. Storage-house.

Q. Do you know what that was used for in 1873?

A. I am not positive; I know for a great many years it has been cupied for the same purpose, because the men who own it are in e storage business and have been for 20 years or more, and I ink have had it all the time.

Q. Was there any case with the elevated road about 174, 175 and 9?

A. At 175 there was a case; yes, sir.

Q. Were you a witness in that case?

A. I was.

6

Q. How much front has that got? A. Nineteen feet nine inches front.

Q. What is the property worth now or when the case was tried; n you tell when the case was tried?

A. The case was tried probably about a year and a half ago.

Q. What was the property worth then?

A. I appraised it at \$30,000 that time, and it was sold for \$30,000.

Q. Since then?

A. No; the contract had been made then, and I appraised it and dn't know it.

Q. You appraised it at \$30,000?

A. Yes, sir.

Q. What was awarded in that case?

A. I don't remember.

Q. Was there any case in regard to 179 Pearl street?

A. There has never been any suit about that.

Q. Or 182?

A. I don't think so; I had nothing to do with it; I don't know.

Q. Were there any other cases, any other of the lots or property on Pearl street where there were cases—the lots that you have testified about?

A. I forget now; I have testified to so many. There was one-

261, I think.

Q. Have you a memorandum there showing the amount of your estimates and the awards that were made on all the property, in that book?

A. No, sir; these are simply the facts as regards the selling and

renting of the property at different periods.

Q. Have you got the awards marked there, when there were any made?

A. No, sir; the awards are in my papers that I make up for each case separately.

Q. Have you one for each case?

Mr. Dickinson: Do you mean what he means by awards? He means verdict. You say you have got the awards made up, and you are talking about something else.

A. I have the facts here in regard to the sale or renting of property. I make up each case, giving my estimate, by itself.

Q. The question is whether you have the awards in any papers and books?

A. I have not.

Mr. Baker: Where did you get the fact in regard to the award

regarding the American National Note building?

A. I got that from the attorneys, and I also got that from the daily papers published at the time. I don't see the paper here, but I remember the time.

Q. You remember the amounts?

A. I know Judge Truax had \$75,000 and Judge Patterson \$63,000.

Q. There were two cases?

A. Yes, sir.

Q. And the elevated road went on each side of this property?

A. Yes, sir.

Q. Opposite sides of the property?

A. Yes, sir.

Q. Whereabouts was the property located?

A. It is on the east side of Greenwich street, below Thames, and on the west side of Church street, directly back of Trinity church.

Q. And the entire building is occupied by the American Bank Note Company?

A. Yes, sir.

Q. How high is that building?

A. Seven stories.

Q. How much frontage had it upon the elevated road?

A. I think it has 125 feet.

Q. On each side? 648 A. Yes, sir.

Q. Does that building extend across an entire block?

A. No, sir; it is what we call in the center of the block; it runs through from one street to the other; Greenwich street and Church street both run north and south; the cross-streets run east and west; it is south of the first cross-street; it is probably 75 or 80 feet south.

Q. This is in the center of the block, but it runs from one street

to the other street?

A. Yes, sir; it has two fronts.

Q. How much frontage has it on each of those streets?

A. One hundred and twenty-five feet.

- Q. How many tracks were built in front of that property on Greenwich street?
 - A. There are four there. Q. And all planked over?

A. Yes, sir.

Q. How many on Church street?

A. There are three, I know; I think there are four; there are three anyway; I think there's a switch there.

Q. How high is the elevated road there?

A. I should think 22 or 25 feet. Q. Just about the ordinary width?

A. I think so.

Q. How many trains a day run there?

A. I don't know; they average there a train every two or three minutes in the mornings and afternoon, and I suppose at other times of the day every four or five minutes.

Q. It is almost in constant use? A. It is sometimes blockaded.

Q. But it is in constant use?

A. I think in the morning it is probably every two or three minutes; in the middle of the day, five or six.

Q. You think they allowed \$75,000 on one street and \$63,000 on the other?

A. I think so.

649

Q. How much is that entire property worth running through on both streets?

A. I suppose that property is worth \$400,000.

Q. Is not that building worth at least \$900,000, the lot and the building?

A. I don't think so.

Q. You are familiar with real-estate values in the city of New York?

A. I have told you what I thought it was worth.

Q. Are you familiar with the value of that property?

A. I know that property cost them a great deal more than that. Q. Is not that property worth at least \$900,000, taking the frontage on both streets, and the building?

A. I don't think so.

Q. Did you testify in that case the value of it?

A. I did; I thought I had the paper with me, but I don't find it. 48 - 55

Q. What did you testify that property was worth? A. You mean to include this from street to street?

Q. Yes, the entire property?

A. Yes, I am wrong; I think I testified in the neighborhood of \$700,000—\$650,000 to \$700,000.

Q. Didn't a number of witnesses testify in that case that that

property was worth from \$900,000 to \$1,000,000?

A. I don't think any such figures were ever reached by anybody that I remember.

Q. You didn't remember just now very accurately what you testified, did you?

A. Well, I was calculating on the wrong frontage; I did 650 not figure on the 25 feet. Q. That property is occupied by an institution or by a company

that makes bank notes?

A. Yes. sir.

Q. That makes very fine, the very finest kind of style of engravings?

A. That is correct.

Q. Where the plates are very delicate work?
A. They do as fine work as can be done in that line.

Q. I suppose they could make us a very fine picture of the Postmaster General to put on a bank note?

A. Yes, sir, or any other gentleman. Q. Or of a Congressman or a lawyer?

A. Yes, sir.

Q. And they use the entire building in that business?

A. Yes, sir, they do.

Q. And there was testimony in that case showing that the elevated road interfered with the transaction of that business? A. There was.

Q. It interfered with their work in making these plates? A. Yes, sir.

Q. And it interfered with their light? A. Yes, sir. Q. What explanation have you to make of the fact that they only allowed about ten per cent. of the entire value of it?

A. I am sure I don't know what was in the judge's mind.

Q. You have no explanation to make of it, then? A. I have nothing to do with the judge.

Then adjourned to Thursday, June 25, 2 p. m.

651 June 25-2 p. m.

EDMUND H. MARTINE recalled.

Cross-examination continued by Mr. BAKER:

Q. When was the elevated road built in Pearl street, New York? A. It was commenced, I think, about November or December, 1877, and finished in the summer of 1878. The first trains ran on the 26th of August, 1878.

Q. So there was no practical experience in New York, or on Pearl street at any rate, with an elevated railroad until after August, 1878?

A. Not on Pearl street. We had a road prior to that in New

York. Q. Whereabouts?

A. On Ninth avenue.

Q. When was that built?

A. That was opened as far back as 1869. It ran on Ninth avenue and Greenwich street from Twenty-ninth to Dey street, what was commonly called the one-legged railway, for the reason that it was set on posts on the curbstone and ran only on one side of the street.

Q. When was the present Ninth Avenue line built?

A. That was extended one way and another and finally in 1878 or 1880 it was reconstructed and operated as it now is, and as the other roads are run.

Q. Can you tell us what the Armitage building rented for in

1878 ?

A. \$5,175.

Q. In giving your testimony-in-chief, why did you compare the

price of rental, or recent rentals, with 1873? A. I did that for the reason that the rentals in 1877 and 652 '78 were low, on account of the depressed value caused by

the panic. Q. Then the depreciation that you have testified to in this case

was a depreciation caused by a panic, was it not?

A. And partially caused by the elevated railroad.

Q. How could the elevated road cause a depreciation before it

was built? A. It was commenced in December, 1877, the post holes were dug, the iron-work laid in the street, and it was actually being constructed when the lease was made in May, 1878.

Q. It had not been in operation?

A. It had not.

Q. What did it rent for in 1877?

A. \$6,950.

Q. What did you compare that rental with 1873 when it was

\$9.450 for? A. I explained that yesterday, that I took 1873 because it was good times and compared with the present times, the last few years, when the times were good.

Q. The rental of 1877, when it was only about \$6,000, was a rental that had been fixed before the elevated road was built there?

A. Yes, sir.

Q. And in 1888 you testified it was \$5,415?

A. Yes, sir.

Q. So that the depreciation in the rent was less than \$600?

A. I beg your pardon.

Q. You have just testified that in 1877 before the elevated road was built, the rental was \$6,000?

653 A. \$6,950.

- Q. And in '88 you testified yesterday it was \$5,415? A. That was the rent-roll if the building was all rented.
- Q. So the depreciation was not \$4,000, was it?

A. The failure to appreciate was.

Q. But we are talking about the actual change that took place in the rental value; what did you testify that it depreciated \$4,000 for?

A. I don't think I made any such statement as that.

Q. Didn't you testify in 1873 that it rented for \$9,450, and in '88 for \$5,415?

A. I did so, and that is the truth.

Q. And did you not testify to that for the purpose of conveying to this jury the idea that that amount of depreciation had been

caused by the elevated railroad?

A. I did not say that. It has been by the elevated railroad, I say it for this reason, the actual depreciation down to 1877 was caused by the panic, the road came there and created a further depreciation, what was commonly called in New York a scare. It recovered from that somewhat, generally speaking, on the railroad streets, but with this weight on it, it has not appreciated with other property, and if it follows other property in adjacent streets where there is no road, it would have gone back to its old rent.

Q. That is the argument you make? A. It is not an argument, it is a fact.

Q. You have no actual rentals on which to base that on this street?

A. I do not say on this street.

Q. You compare that with some other street?

A. Certainly.

Q. In the testimony you gave, you gave actual rentals on this street?

A. I did.

Q. And you showed a depreciation on the Armitage building of about \$5,000 unexplained, except that it was the elevated railroad? A. I have explained it now.

On cross-examination:

Q. Now how much of that actual depreciation occurred before the elevated road was built; figure it out? A. About \$1,500.

Q. It is \$5,000 within \$300?

- A. If you will deduct \$5,415 from \$6,950, it is a little more than \$1,500.
- Q. You deduct that from \$5,000 and you have \$3,500 of depreciation caused by the hard times?

A. Do what?

Q. If you deduct that from \$4,000, you have \$2,500 of depreciation that was occasioned by the panic and the hard times?

A. Where did you get your \$4,000 from?

Q. You testified that in 1873 this property rented for \$9,450?

A. Yes, sir.

Q. And in 1838 it rented for \$5,415?

A. Yes, sir.

Q. Now you show that \$1,500 of that depreciation was after the elevated road was built, which must leave \$2,500 of it that was before the elevated road was built?

A. Yes, but you do not allow for the recovery that would have

been if the road had not been there.

Q. That is something that is imaginary.

655 A. I don't know why it is imaginary when you go onto adjacent streets.

Q. You have to go on adjacent streets and form an estimate and

an opinion?

You do not form an estimate; we take actual rents.

Q. Do you show that the elevated road, by an actual depreciation in rentals, depreciated the rent of this property \$4,000 a year?

A. The actual depreciation caused by the road is \$1,500 from 1877 to 1878, but the failure to appreciate which has kept it down, in many cases it has gone lower yet.

Q. How do you know it would have appreciated if the elevated

road had not been built there?

A. For the simple reason that every other street around it has gone up.

Q. What streets did you compare it with?

A. I take Pine street, Maiden Lane and Beaver street.

Q. Streets in the immediate vicinity?

A. Yes, sir.

Q. Do you know what the changes have been in the rentals in property on those streets since 1873?

A. Yes, sir.

Q. Actual changes?

A. Yes, sir.

Q. Have any changes taken place in New York wholly independent of the elevated road that are influenced by other causes, since 1873?

A. What kind; changes of value?

Q. Changes in the fact that they changed the location of their business.

A. There are changes in New York.

Q. Has not Pearl street depreciated in value because the 656 cotton men went off the street and went to Hanover square?

A. They are in Pearl street.

Q. But they went to Hanover square, where there is an open space?

A. They were driven off the street by the coming of the elevated

road.

Q. How do you know that?

A. Because I have heard them testify to that constantly. heard the president of the Cotton exchange testify to it.

Q. Don't you know that they went off that street for other reasons?

A. I do not.

Q. That the elevated road had nothing to do with it, that they wanted better quarters, and they moved to another place on that account?

A. They are in the same neighborhood really that they have been for the last twenty-odd years.

Q. But they went out of this particular location?

A. They are today within 100 feet of where they were from 1872 to 1875.

Q. Then they were not driven off the street?

A. Yes, they went into the square where they were not injured by the railroad.

Q. They built a Cotton exchange?

A. Yes, sir, it has three fronts.
Q. When did they build the Cotton exchange?

A. They moved in about 1885.

Q. Did not the building of the Cotton exchange depreciate the value of rentals on Pearl street? 657

A. No, sir.

Q. Have the rentals and values of all the streets in New York depreciated the same as on Pearl street, all the streets where the elevated road has been built?

A. No, there is a difference.

Q. Is not Pearl street a street where the depreciation, for some reason or other, has been the largest?

A. No, I think Fifty-third street would compare with it.

Q. The residence part of Fifty-third street? A. Yes, sir.

Q. Is it not true that residence property, especially the better class of residence property, is more seriously injured by the elevated road than any other property in New York?

A. With the exception of office property, which might be com-

pared with it.

Q. The next kind of property most seriously injured, is store property, is it not?

A. Yes, sir.

Q. But all store property is not injured alike?

A. The streets vary so in width, it makes a vast difference.

Q. Is it not true that on a number of streets in New York, the elevated road has actually made the street?

A. I don't say that.

Q. Are there not streets in New York where the elevated road has improved the rentals and brought a large number of people doing business on the street?

A. There are some streets in New York that we may say are benefited, and there are other streets adjacent that are benefited still

Q. What streets are benefited in New York by the elevated road?

A. The upper end of the island, where the road is not run, 658 has increased largely in value.

O. But down below Forty-second street?

A. Twenty-third street and Fourteenth street, streets 100 feet wide, have increased largely.

Q. Has Sixth avenue increased in value?

A. Sixth avenue has increased, but Fourteenth and Twenty-third streets have increased more; they have no elevated road; they are both 100 feet wide, the same as Sixth avenue.

Q. There is property in New York that has actually increased in

value since the elevated road was built on it?

A. Yes, the business was there before the road came.

Q. What street in New York is injured the most, Pearl street? A. The lower part of Pearl street is injured the most because they

are mostly office buildings; I think Fifty-third street is about as bad as any.

Q. That is where the good residences were?

A. Yes, sir. Q. What next?

A. The Bowery below Beyer street.

Q. Have you any book made up of the benefits of the increased rentals on any street?

A. Where the road runs?

Q. Yes.

A. The benefits are always included in my estimate of the property. I take everything as I find it, good and bad, and say it is worth so much money, the value of what it sells for proves that.

Q. The New York Central railroad runs some distance in the city of New York on a stone viaduct?

A. Yes, sir. 659

Q. About how long is the stone viaduct?

A. Three-quarters of a mile.

Q. What street does it run in? A. Fourth, or Park avenue.

Q. How wide is that street?

A. One hundred and forty feet.

Q. How wide is the viaduct?

A. Less than 60 feet. Q. Solid masonry?

A. Except at the streets.

Q. Is there any passage longitudinally under that viaduct?

A. No, sir.

Q. So that the street is actually built up with stone, except that arches are left for the cross-streets?

A. That is true.

Q. What is the average height of the viaduct?

A. At the highest point it is 38 or 40 feet, and it runs down to 16 feet.

Q. Is it the highest at the lower end?

A. Yes, sir.

Q. Goes into a hill there?

660

A. It goes into a tunnel at Ninty-sixth street.

Q. What makes the depression there?

A. From One hundred and first street it rises up to a hill going south.

Q. And the trains run on the top of that viaduct?

A. Yes, sir.

Q. Is the viaduct inclosed?

A. No. sir.

Q. You say it is about 60 feet wide?

A. I should think it was. Q. How much street does it leave on each side?

A. About 40 feet on each side.

Q. What sort of property is that along there on each side, resi-

dence property, or business property, or what?

A. Down at One hundred and first, One hundred and second. One hundred and third, One hundred and fourth, One hundred and fifth, they are mostly what we call tenement-houses, with very few exceptions, that face on the street, not on the avenue. They are built facing north and south on the cross-streets.

Q. They do not face on Fourth avenue?

A. The avenue has been destroyed by the viaduct.

Q. Did they ever face there?

A. No. The viaduct was built in 1837. There were no houses there.

Q. The viaduct was there before the street.

A. Yes, sir.

Q. They merely laid out a 40-foot street on each side?

A. No, that street was really laid out in 1814. Q. It was built there a great many years ago?

A. It was.

Q. The 40 feet on each side is practically used as an alley?

A. It is a pretty broad alley.

Q. You say they on't front their buildings on it?

A. No, it has virt ally destroyed Fourth avenue; everybody will tell you that.

Q. How could it destroy Fourth avenue, built 50 or 60 years ago?

A. The very fact that the people do not use it.

Q. There was not much there to destroy. Was there building on that avenue when it was built there?

661 A. There might have been some frame houses. I am not so old as that; I can't tell. There are some very old shanties there, in some places.

Q. How much of the population in New York resides above Forty-second street?

A. I could not tell you that.

Q. Half of it?

A. What really we call the population, they live all over; they live in Brooklyn and Jersey.

Q. People do actually live on the island?

A. I cannot go into figures because I never figured it out.

Q. Most everybody lives above Forty-second street?

A. No; you take it east of the Bowery, all the way down to Chatham square, there are more people there to the square mile than in any other part of New York.

Q. In a tenement district?

A. Yes, sir. The Seventeenth ward, which is below Fourteenth street, has the largest population of any in New York.

Q That is where they are packed in like sardines?

A. There are a great many people there, and they are good rentpayers. A tenement house will pay you a great deal better than a private house.

A JUROR: With an elevated road in front of it?

A. The elevated road runs through First avenue in the Seventeenth ward.

Q. But the people who own their own homes, occupy considera-

ble land, mostly live above Forty-second street?

A. I want to say that a great many people are in the old Ninth ward, on the west side.

Q. The people who live below Forty-second are either very poor

or very rich?

A. No, sir; Levi P. Morton lives within one block, and Samuel J. Tilden, Cyrus W. Field and Peter Cooper formerly lived there.

Q. The question I put you was whether the people who live be-

low Forty-second are not either very rich or very poor?

A. No, sir. You don't know New York, or you wouldn't say so. Q. Samuel J. Tilden was rich, wasn't he?

A. Yes, sir.

Q. Mr. Cooper was rich?

A. Yes, sir. If you go east and west in New York, below Fourteenth street, you will find a dense population of what you call poor but respectable, hard-working people.

Q. Did you ever run a planing mill?

A. No. sir,

Q. Did you ever run a chair factory?

A. No, sir.

Q. Did you ever do any manufacturing outside of the soap business?

A. No, sir, very little of that.

Q. Where was your soap factory located?

- A. At that time number 74 Robinson street, which is now a continuation of Park place, 102 Park place.
 - Q. Did the elevated road interfere with the manufacture of soap?
 A. The elevated road was a block and three-quarters from it.

Q. Did you go out of it because of the elevated road?

A. No, sir.

Q. If you never carried on a planing mill, how do you know that Mr. Backus cannot carry on his mill just as successfully after this road is built in front of it as before?

A. By common sense and by experience that I have had in business, generally, around town in New York. I have seen

a number of mills.

Q. You don't know anything about it?

A. I know good work from bad. I have got common sense to know some of the things that would go into the building would be a damage to it and a nuisance.

Q. Do you think that the planing-mill business, as it is carried on at the present time, can be carried on successfully without rail-

road facilities?

A. Railroads we must have for every business, for everybody. I admit that.

Q. If you were going to locate a planing-mill today, in order to compete with all other planing-mill men, do you think you would locate a mill where the lumber yard that was tributary to it or was to be used in connection with it was a half a mile away?

A. I would locate my mill where I would have the best shipping

facilities and as near as I could get to trade centers.

Q. You don't know whether this would increase the fire risk

down there or not, do you?

A. I know we can insure a house for one price in New York. I know that when we owned that mill and Mr. Serril was in it, we paid as high as 6 per cent., when you can insure a private house for 10 cents a \$100.

Q. Is that the only explanation you have got to make?

A. We had the building insured.

Q. What is the usual rate on planing mills?

A. There is no usual rate. They get all they can, and they are

chary of taking them.

Q. Do you know of an insurance company in the world 664 that insures a planing mill at the same rate it does a dwelling-house?

A. I do not.

Redirect examination by Mr. Dickinson:

Q. Mr. Baker has asked you whether you ran for judge also; and asked you whether your brother was a judge of the police court in New York. Your brother was district attorney of New York, wasn't he?

A. He was for three years.

Q. Succeeded to John McKeon?

A. John McKeon died, and then there was another gentleman appointed for several months.

Q. John McKeon was a predecessor?

A. He was really a predecessor of my brother.

Q. One of the most distinguished men in this country, wasn't he?

A. He was.

Q. Wheeler H. Peckham was another? A. He occupied the place for a while. Q. Who succeeded your brother?

A. John S. Fellows.

Q. Also a man of national reputation?

A. Yes, sir; now a member of Congress.

Q. It is quite an honorable position?

A. Yes, sir.

Q. Especially for a Republican to get there?

A. It is.

Q. I think Randolph Martine is a Republican?

A. No, sir; the whole family are Democrats.

Q. He was elected by the largest majority on the ticket when he was elected judge of the court of general sessions? 665 A. Yes, sir; my brother had 115,000, and Mayor Grace,

who was next, had 110,000. Q. I think the present district attorney, who occupies the position

your brother held, De Lancy Nichols, was formally a deputy?

A. Yes, sir.

Q. Your brother is not of the grade of a police justice?

A. No, sir; a police justice is simply justice of a court where drunks and so forth are tried.

Q. The court of sessions is a court of general jurisdiction?

A. Yes sir; a position for 14 years, and a salary of \$12,000 a year. Q. You have been asked about having been in the soap business; you have been called to testify, I think, in a hundred cases?

A. I have actually testified in a hundred of these railroad cases. Q. You have been called upon to appraise land for people other

than railroad suits?

A. Yes, sir, I have in hundreds of cases, estates divided and things of that kind, people come to me about.

Q. Because you keep a record so as to get at the values properly?

A. Yes, sir.

Q. You are trusted to that extent by people who employ you?

A. Yes, sir.

Q. As my friend was rather inclined to slur you, what men are your clients who have actually employed you; I think some of the

names would be recognized?

A. John E. Parsons, Burrill & Burrill, Sullivan & Crom-666 well, Peckham & Tyler, John M. Chandler, Platt & Bows, Cannon & Atwater, G. Willit Van Horn, Rockwood & Hale, ex-Recorder James Smith, Charles J. Ridgway, James Demorest, Johnson & Lamb (Johnson is now United States district attorney in Brooklyn), Nelson J. Waterbury, Beekman & Higgon (Beekman is now corporation counsel), R. O. Wilcox, Strong & Cadwalader, Sackett & Lang, Reed & McEwan, Gray & Davenport (now judge of the court of appeals), Sackett & Bennett, W. S. Lowe, A. E. Woodworth, J. P. & E. B. Crowen, Harris & Greenbaum, Whitehead, Parker & Dexter, Charles H. Lee, A. B. & A. W. Mann, Arno, Rich & Woodford, Stewart L. Woodford (formerly lieutenant governor), M. E. Hamilton, Gratz & Nathan, Sydney Smith, John S. Purcel, and a number of others.

Q. By these you have been called in real-estate matters, to ap-

praise property in suits or elsewhere?

A. Yes, sir.

Q. And you had to keep the details in your office so as to be competent?

A. I had; I got the knowledge in every way I could, and kept it.

Q. In the various suits in which you have been called on to testify, and in the various proceedings in which you have given appraisals, has your reputation for truth and veracity or good judgment, your business reputation ever been attacked?

A. No.

Q. In all the cases in which you have testified against the Manhattan railway, has your reputation ever been attacked?

A. No, sir; on the contrary, several of the lawyers are friends of mine, and they have told me that they are willing to take my values in cases.

Q. You have to come to Michigan to get that done; you have to get away from home?

A. Yes, sir.

Q. You are not ashamed in having had an interest in the soap business?

A. I would like to state to the jury the reason why I went into the business. I went there to protect my father who had a man with him who was not taking care of him. I went there and took my business with me, and staid there about three years and got out of it. I continued my business all along; that was back in 1879.

Q. Your father sold this property on Fifty-third street, bought it in a foreclosure sale, and sold it subsequently?

A. Yes, sir.

Q. When did you make this settlement of \$5,000, or when was it made?

A. I think in 1886 or 1887.

Q. It was not made later than 1887?

A. No, I don't think it was.

Q. When did your estate dispose of that property?

A. In 1883.

Q. How did you come to be getting a settlement for \$5,000 three or four years after you had sold the property?

A. A lawyer went to my brother, who was the executor, and told him he thought he could collect something for him on that property from the elevated road. My brother told me of it. I said I would have nothing to do with it that we had sold that

668 would have nothing to do with it, that we had sold that property, and I thought that anything that was there ran with the land.

Q. When was that done by your brother with the lawyer?

A. That was after we had sold it. I told my brother I would have nothing to do with it.

Q. At the time that that lawyer made that arrangement with you, had not the courts of New York decided that there could be no damages recovered, the lower courts?

A. I think so.

Q. Did you know or did your people know that they could recover any damages from the elevated road?

A. I don't think they did at that time.

Q. And you had already sold your property when the settlement

as made? A. Yes, sir. I would like to say here that the settlement was only ade for the loss of rent. There was another collection after that the present owner.

Q. Do you know anything about that? A. I know what Mr. Peckham told me.

Q. The lower courts first held that you could not recover against n elevated road?

A. Yes, sir.

Q. Because the city had granted permission to run on the streets

New York?

A. Yes, sir. Until the court of appeals decided otherwise, the ecision of the supreme court was that it was an illegal structure nd had no right in the street until the abutting owners were comensated.

Q. So that at the time you made the settlement for the loss of rent, it was from the time after the structure was built, for the time you owned it, and you were not aware or the courts 69 had not yet come to the conclusion that you could recover

or damages? A. No, sir.

Q. You did not, even in that settlement, settle for damages to the ealty, did you?

A. No, sir, the present owner collected money from the railroad fterwards.

Q. Do you know what it was?

A. I know that his attorney told me. Q. At least you did not collect any?

A. We did not collect, because when we sold we made no reser-

Q. After you had sold the property you could not collect money or the fee?

A. No, sir.

Q. As I understand you, you wanted to get at the depreciation n value during ten years, and you take the year 1873 as the year it which the prices were normal, unaffected by extraordinary comnercial depression?

A. That is so.

Q. And now you fix the depression by showing that other property, over which the elevated railroad did not go, have appreciated up to and beyond the prices of 1873, and yet that the property over which elevated structures go have not come up to that value?

A. That is the fact.

Q. In that way, you show that the actual depreciation, as compared with surrounding property, as the value was in 1873 as compared with the value now, all property where the railway goes?

A. Yes, sir.

670

Q. Is there any cause for such depreciation anywhere where the elevated railroad goes, except the elevated railroad?

A. None that I know of.

Q. Is there any other place that property on any street depreciates like this, or has depreciated, or has not kept up and got back to the prices of 1873, except where the elevated road runs?

A. With the exception of the extreme end of the island.

Q. I am speaking of the business property.

A. No, sir.

Q. Is it the universal rule, then, as to business property, below Canal street, we will say, or below Fourteenth street, to come up high enough; is it the universal rule that business property, except where the elevated road runs, has appreciated so that it is up to and past the prices of 1873?

A. Yes, sir.

- Q. And where the elevated road runs the prices stand still, or are lower than 1873?
- A. Lower than in 1873; and they got down to the '77 prices by the panic, and in many cases they have stayed about the same, with a little increase.
- Q. I suppose the panic of 1873, and its effects were felt to their extreme in about 1877 or '78?

A. That is the lowest.

Q. So that the universal rule all over the lower part of New York and everywhere was that there was a depression then?

A. Yes, sir.

Q. And when the depression was relieved, this property came right up and went back to the prices of 1873, and passed them, except where the elevated structure went?

A. That is correct.

Q. You have been asked whether the rule applies to property near Pearl street, the same depression or the same change. Give me some illustrations west of Pearl street, and in the immediate vicinity of Pearl street, where the elevated road does not run. Give us the names of the streets.

A. No. 76 Pine street, just north of Wall.

Q. Let us know the relation of Pine street; point out Pearl street and Pine street on the map.

A. Pine street is the first street north of Wall street.

Q. Point out Pine street and the place where Pearl street comes. A. There is Pearl, that green line where the cars run, and this is Pine. Take it away from Pearl street on Pine, that is in the immediate vicinity, property there that in 1874 rented for \$980 rents now for \$1,650. It is fair to state that that building had about \$3,200 expended upon it in 1878; that would add about \$320 to the rent. If the property had been in the same condition in 1874 as now, it would make that rent \$1,300 and now \$1,650. Number 74 Pine street, next door, rented in 1874 for \$1,240, in 1888 for \$1,400. Number 72 Pine street in 1874 rented for \$1,327.50, and now for \$1,450. Number 78 Beaver, which is just northwest of Wall, commences at Pearl street. I testified to that yesterday. That is a store on Beaver street; the building is 22 feet wide, 96 feet deep, runs through from Pearl to Beaver. That is where I testified that the

Pearl Street store, one-half of the first floor rents for \$600, and the Beaver Street store for \$1,200. In Wall street, as compared with 1878 and 1879—that was the lowest period caused by the panic—

1877 was really the lowest period. Water street is below
Pearl. Water street is the next street east; it is cut off by
the elevated railway from the center of the city; there is no
elevated road on it. That rented in 1878 for \$1,600; it rents now
for \$2,200. Maiden Lane is two streets north of Pine; it crosses
Pearl. The property in question that I speak of is about 200 feet
west of Pearl street. That property rented in 1877 for \$3,000; it
rents now for \$2,750. 184 Water street in 1878, \$900; in 1884,
\$1,800. Water street, corner of Old slip—Old slip is a cross-street
south of Wall—Water street is the first street east. In 1887 it
rented for \$2,500, and now for \$3,500. 64 Water street in 1878 was
\$1,200, now \$1,750. 62 Water street the same. Those were testified
to by a witness for the elevated railroad. In Williams street, which
is the first street west of Pearl, running parallel to it, in 1874

\$4,150, now \$5,250. 130 Williams in 1880 \$4,125, and now \$6,000. Beaver street, corner of Hanover, that is about 150 feet from Pearl street west, in 1877 they got \$4,500 rent; today they get \$6,800. 116 John street, which is two blocks north of Maiden Lane, a build-

ing there rented in 1871, '72, and '73, for \$1,000; it brings the same rental now, a small building.

Q. Is that about the universal rule, the figures that you have

illustrated?

A. Yes, sir; with the exception of some property on Water street, where the fee value has got back, and the rental value has not got back for this reason: if the fee value in 1873 was \$10,000, the rental value, 10 per cent., would be \$1,000; if the fee value got back, the relation between the fee and rental would be 8 per cent., making \$800, showing, if the relation between the fee and rental value had remained the same, the rent would have been the same as before.

673 Q. The rent has not increased in proportion with the fee

because of the reduction of interest by law?

A. Yes, sir.

Q. So that the value of property you have increased and the rent has not correspondingly increased into about two per cent. because of this change?

A. Yes, sir.

Q. Mr. Baker has asked you in reference to property below Forty-second street, and has stated that the people are very rich or very poor. Now, I will ask you if even below Twenty-third street, and even below Fourteenth street, east of Broadway and east of Madison avenue, and east of Fourth avenue, there is not a mass extending over to the business portion of New York on the river, a mass of people, a dense population, who own fine dwellings, of the merchant class?

A. Yes, sir, because that was the residence quarter of the best people of New York, I mean the richest people, at one time. Those

houses are now occupied by working people, who own the houses. They may live in part of it and rent out some of it.

Q. But there is a strong middle class of people, neither very rich

nor very poor?

A. I guess a good many of those men are worth a good many thousand dollars.

Q. You call a rich man in New York worth a million, or five hundred thousand at the very lowest?

A. We have got so that a man is a rich man who is a millionaire.

Q. Those men are worth in their thousands?

A. Yes, sir.

Q. Those are strong men, medium, and there is a dense mass of population of that class in there east of Broadway?

A. Yes, sir, there is around Tenth street and Tompkins' park

very fine houses.

Q. You take it down to Eighth street and Clinton place, and the property north and west of Clinton place?

A. Yes, sir, and go still further off Clinton place, fronting on

Washington square. Edward Cooper lives there.

Q. There is a mass of people not very rich, and certainly not poor?
A. Yes, sir: and go west of that, what we call the Ninth ward, below Fourteenth street and west of Sixth avenue, and down as far

as Houston street.

Mr. Baker: Show us a Republican ward in New York.

A. There is a district made up for Robert Ray Hamilton which takes in part of the Twentieth ward. They run from what we call the Tenderloin district into a portion of the Twentieth ward. It

was fixed up on purpose.

By Mr. Dickinson: As the elevated roads have carried people to the north, or there has been rapid transit in New York, property upon the elevated road and on the bystreets accessible to the elevated road has very rapidly and very largely enhanced in value by reason of the elevated road?

A. There are exceptions. If you take the Sixth Avenue road, Sixth Avenue property has advanced between Fourteenth and Twenty-third, west of Central park. It has advanced on Ninth avenue, where the elevated runs, but the lots on the adjacent streets have advanced more.

Q. To what do you attribute the fact that the property on the street bearing the elevated road has not kept pace with the side streets, although on the main avenue?

A. On account of the elevated road being on it.

Q. You have been asked about Sixth avenue. Along at Twenty-third street, I suppose Altman was there before the

elevated road came?

A. All the present stores came before the road came, with the exception of one, Herrick Brothers, who were on Eighth avenue two blocks west, between Twenty-fourth and Twenty-fifth. There was no trade there, and they bought a piece on Sixth avenue, and a piece on Twenty-second and Twenty-third, and they have the same

front on those. Macy is on the southeast corner of Fourteenth and

Sixth avenue and has been there a good many years.

Q. Where does the great traveling public, in going up from the business part of New York, the transient people of which New York is always full—

A. Yes, sir, we claim over 200,000 transient people in New York

constantly.

- Q. Where do they usually take the elevated roads. All the houses up there that are full of transient people, the Hoffman, the Brunswick, the Albemarle, the Fifth Avenue, the St. James, the Coleman, the Gilsey, and all those houses are within a few blocks?
 - A. They are between Twenty-third and Twenty-fourth streets.

Q. The transient people usually alight at Twenty-third street on Third avenue, and Twenty-third street on Sixth avenue.

A. Yes, sir.

Q. And then there are a lot of hotels around Union square also?

A. Yes, sir.

Q. And they alight there in great numbers?

A. Yes, sir.

Q. On the corner of Fourteenth and Sixth avenue is Macy's?

A. Yes, sir.

Q. And Altman is just above Twenty-third street?

A. Altman is at the southwest corner of Nineteenth street.

Q. And those hold out and always have held from the time of their establishment, more reasonable prices than on Broadway?

A. Yes, sir.

Q. Because their rents are supposed to be less?

A. Yes, sir, it is a well-known fact.

Q. How wide is Sixth avenue at this place?

A. 100 feet wide.

Q. Where does the elevated road run, on the side or in the middle?

Λ. In the center of the street. One each side are horse-car tracks.

Q. How many tracks has the elevated road?

A. Two tracks.

Q. Since the elevated road how much has the Twenty-third Street property increased in value?

A. It has advanced five times where Sixth avenue has advanced

three times.

Q. I suppose the elevated roads have led to the increase of the hotel business in the upper part?

A. They have helped New York greatly.

Q. Since the elevated roads have come, the Astor house has gone down as a guest-house?

A. No, sir, the Astor house is better today than it ever was; it is

full all the time.

Q. The St. Nicholas has closed?

50 - 55

677 A. It has been torn down and stores erected. There is another one in Washington place called the St. Nicholas, not so large, near the New York hotel.

Q. But generally the hotel business has gone uptown?

A. Yes, sir.

Q. Some of the best theatres are above Thirtieth street?

A. Yes, sir.
Q. You haven't got any theatres on the elevated road, have you? A. There are two old theatres, what we call the Old Bowery thestre and the Third Avenue theatre, a variety show,

Q. There is not a first-class theatre on the line of the elevated

road?

A. No, sir.

O. On Fifty-third street, you told me after leaving the stand

something about an illustration of church property?

A. On Fifty-third street, before the building of the road, there was a handsome marble church, a Baptist church, that cost \$95,000. the lot and the building, and they have sold the property for \$45,000 to a colored congregation of the same denomination; the coming of the road drove them out.

Q. Between what streets was it?

A. On Fifty-third street, between Sixth and Seventh avenues.

Q. How wide is Fifty-third street?

A. 60 feet wide.

Q. The elevated road runs in front, in the middle of the street?

A. No, the posts are on the sidewalk. It covers a greater part of the roadway. 678

Q. Do you know of any reason for that depreciation of that property, except the elevated road?

A. I do not. I sold lots on Fifty-third street three years ago for They erected tenement-houses, I think. At the same time they were selling lots on Fifty-fourth street, not so good a street originally, for \$18,500.

Q. Fifty-third street was formerly a fine residence street?

A. It was. I used to rent a house belonging to my father for When the road came I got \$700 rent. Today they get **\$**1,500. \$1,000.

Q. Has the class of residence people changed on that street?

A. Yes, sir, there are colored people on the street. Some of those first-class houses are occupied by improper characters.

Q. Anything of the kind ever known as that kind of tenants

known before?

A. If it was, it was so quiet that no one knew it.

Q. You have not the slightest doubt, as a resident of New York, born there, and having seen the elevated roads come, and seen the effect of them, that, so far as the streets are concerned in the residence portion, or manufacturing, or offices, wherever the elevated road comes, it has been a blight on property?

A. It has been and it will be, no matter what they are worth

there; they would be worth more without it.

Q. I think you said on your direct examination you did not know anything about insurance?

A. I know generally, but not a great deal.

Q. You do not pretend to be an insurance expert?

A. No, sir.

Q. You were not called upon to testify as to fire rates? A. No.

679

Q. You have not professed to do that here?

A. I have not. I know generally, that is all.

Q. You know nothing of the values of Detroit real estate?

A. No, sir.

Q. You do not know McIntosh; you have not met him in your peregrinations?

A. I have not. Q. McIntosh is a witness in New York who came out to tell us of the value of real estate?

A. He is not a broker.

Q. You have seen the Backus property?

A. I have.

Q. You have seen its situation with reference to its railroad facilities from the Michigan Central?

A. Yes, sir.

Q. You have seen how it is protected there by a stone wall on that side?

A. Yes, sir.

Q. You understand that that is because of the railroad facilities required there?

A. Yes, sir.

Q. What have you to say as to the relative value of that situation for purposes of manufacturing business and trade there outside of a local trade, the requirements of shipping and so forth, with the corner property on the next street below, on Twelfth street?

A. It is worth a great deal more money, the same piece of prop-

erty is worth double.

Q. Why?

A. On account of its being a little nearer the business part 680 of the city for one reason, and having shipping facilities, its being on the front of a property where the railroad comes, which virtually makes it a corner.

Q. Did you observe anything about the mill constructed there, and whether the business was arranged within the mill with reference to the Michigan Central road, to guard against fire, or any

injury from it? A. I was told by Mr. Backus, that is all.

Q. You think it would be worth double what it would be on the corner below?

A. I did not mean to say that. I mean it is worth 50 per cent. more than that.

Q. As a business site without regard to the mill?

A. Yes, the land itself. If a lot was worth \$1,000 on the other corner, it would be worth \$1,500 here.

By Mr. LESHER:

Q. I would like to know the nature of the complaints on account of the elevated road.

A. The complaint in New York is the noise, gas, smoke, steam and cinders, the unsightly structure in the street and the loss of light by the structure and by the passing of the cars and the flickering light caused by the cars when passing. You lose the light no matter which way they are going; a car in passing, if the car is between the sun and yourself, it is dark when it comes to the window and when it is so that the light comes between the cars, you have the flashing of the light and in that way you have a flickering light. And another thing, the people will constantly be in the windows when they pass by.

Q. The complaint is according to the occupants of the build-

ing?

681 A. Of course. A private dwelling is worse than where it is a store-house.

Q. You have your office in front of the elevated road?

A. No, sir, mine is in Liberty street, in Broadway. I have lived in front of an elevated road, I know its nuisance.

By Mr. DICKINSON:

Q. I find in the reported cases frequent reference to drippings of rain and snow and oil and stuff, on goods passing under it?

A. Yes, sir, it is constant. Of course it is more so in the winter

when the snow falls.

Q. I want to call your attention to some parts of your testimony where some mistakes have been made in copying. On page 662 you are made to speak of the Northeast railway. You referred to the Northern.

A. Yes, sir.

Q. You are made to say that it started from One hundred and fiftieth. You said One hundred and fifty-fifth, I think?

A. One hundred and fifty-fifth is the fact.

Q. You are made to speak of "from Fifty-third to Eighth avenue," you mean Fifty-third and Eighth avenue?

A. Yes, sir.

Q. You are made to say in answer to a question how wide is Pearl street at this point, formerly occupied by the cotton men, you are made to say about fifty feet in the narrowest part, below there is a place called Hanover square about fifty feet wide.

A. I said one hundred and fifty feet wide. I think it is really

one hundred and sixty-two feet.

Q. You are made to say Coenties street. You said Coenties slip?
A. Yes, sir.

Q. You also, in answer to a question at page 671, in reference to the Bowery, you are made to say 108 Bowery rented in 1873 for \$9,500 and now for \$5,700.

A. It should be 108 and 1081.

Q. At page 700 of the testimony, you are made in answer to the

question, "There is an open square there?" you are made to say at the south end of the square, which is about 600 wide, and it is 50 or 60 feet from the railroads.

A. That should be about 110 feet. I was speaking of the Cotton exchange, which is on the square, and it is about 110 feet from the

elevated railway.

Q. At page 706, you are made to answer the question, "Is the entire roadway spanned? A. Yes, in that block, with the outside

of the track about three feet outside of it."

A. What that means is outside of the track, what we call a track walk, cross-girders put out, and long ties, and on that ties and a tight railing. On this block it extends the whole length except where I said, in front of the Armitage building; Mr. Armitage got an injunction and got an order of the court, and they had to cut it out.

Recross-examination by Mr. Baker:

Q. Did you read your testimony all over today?

A. I did, sir.

Q. Did you find any other mistakes?

A. There are other mistakes, but they are merely formal matters.

Q. In giving your testimony as to the depreciation that was caused by the elevated railroad, you compared rentals in 1873 with present rentals on Pearl street and in the Bowery. What explanation have you got to make of the fact that when you come

tion have you got to make of the fact that when you come to show the appreciation that has taken place on other streets, you compare the present rentals with rentals in 1878?

A. I gave the facts that I could get. I endeavored to get all the information possible on Railroad street and the other streets, and it shows just what I tried to show you, that a failure to appreciate on Pearl street is shown, and the other streets had appreciated from 1877 and '78.

Q. In most of the cases you have compared present rentals with

those in 1877 and 1878?

A. I don't think I did in most of them.

Q. Is it not true that rentals generally in New York, wholly regardless of the elevated railroad, were very much less in 1878 and '79 than in '73?

A. Yes, sir.

Q. Will you tell us what the property number 173 Pearl street rented for in 1877?

A. \$2,500.

Q. I suppose the elevated road in New York has depreciated the property there generally, has depreciated the value of Manhattan island?

A. No.

Q. I suppose the elevated road is a blot on the island?

A. I just said to the contrary. I do not want you to put words into my mouth. I want to tell the truth and I want you to do the same.

Q. I am not on the witness stand. Answer the question. It is not a blot on the island at large, it is a benefit?

A. It is a benefit to the island at large, but those whose property

abuts on it have to suffer for the men who live uptown.

Q. Are you known in New York as the brother of Judge Martine?

A. I think so; I have been his brother 48 years. 684

Q. Are these cases before him?

A. No, sir, I would not go as a witnes- in any case before my brother; he would not let me either.

Mr. Dickinson: Were you ever sworn before your brother in your life?

A. No, sir.

By Mr. BAKER:

Q. When did your father buy that planing-mill property?

A. He bought that property after the panic of 1873. My impression is that it was 1876, it may have been '75.

Q. He bought it on a mortgage foreclosure?

A. Yes, sir.

Q. How long a time before that?

A. He owned the land and sold it for \$92,000.

Q. When did he sell it?

A. He sold that mill prior to 1873.

Q. About when?

A. I don't remember now, probably along about 1870, I won't say positively about that.

Q. Who built the mill? A. Mr. Serril.

Q. Your father bid it in on a mortgage foreclosure for \$60,000?

A. He was the only one who bid on it. He bid the face of the mortgage, and there was no other bid, and it was knocked down to him.

Q. What year was that?

A. I think it was about 1876.

Q. When did he sell it?

A. His estate sold it in 1883.

Q. For how much?

685 A. I think \$75,000 or \$78,000.

Q. When was the elevated road built in front of it?

Q. Up to the time it was sold by the estate, did the estate make any claim against the elevated road for damages?

A. We never made a claim against the road, except in the way I told you by this lawyer. He came and said he would do it, no cure, no pay.

Q. No claim was made by the estate until a lawyer called your attention to it?

A. No, sir.

Q. And you settled whatever claim you had for about \$6,000?

A. Yes, sir.

រ្សវូ6រ

O. Did you execute a deed to the company?

A. I don't know; the executors may have done so, I didn't. Two brothers and my sister were the executors. I presume they gave something to release their claim. They could not give a deed for rent, so I know they did not give a deed.

Q. Your action was simply for rent?

A. Yes, sir; and they settled with the present owner for the damage to the fee.

Q. You do not mean to say that the legal rate of interest in New

York fixes the rentals there?

A. Yes, sir; the legal rate is six per cent. When money is cheap you can get it for 4 and $4\frac{1}{2}$. When it is dear it goes up to 6.

Q. You testify that the rent has decreased because the legislature

reduced the rate of interest?

- A. Certainly. If a man who has a mortgage on his property, and is paying 6 per cent. instead of 7, he can afford to take less from the tenant.
- 686 Q. Is not that due from the fact that money was cheap and not the statute?

A. That cheapened it in the first place.

Q. You can cheapen money by an act of the legislature?

A. Certainly.

Q. How are the rents of buildings fixed in New York?

- A. Rents are not fixed. There is a rule that a man wants to get on tenement property 10 per cent. gross rental; on office buildings the same, and on store property he tries to get 8 per cent. Sometimes he does not do it.
 - Q. That is fixed on the valuation of the ground and the building?
- A. It is the property as it is. If it is worth \$10,000, he says I want \$800 rent for my store, and pays the insurance and taxes.

Q. How much does that net?

A. Five or six per cent.

Q. 175 Pearl street, what did that rent for in 1877 and '78?

A. 1877 it rented for \$3,400.

Q. 179 Pearl street, what did that rent for in 1877 and '78?

A. In '77 it was \$1,800 and in '78 \$1,200.

Q. 182 Pearl street, what did that rent for in 1877 and '78?

A. I have not any rents for that. That building is a storehouse, and has been for years.

Q. 138 Pearl street, running through to Water street, what did that rent for in 1877 and 1878?

A. It rented in 1877 for \$7,800.

Q. 144 Pearl street, what did that rent for in those years? A. In 1877 it rented for \$3,550.

Q. 102 Pearl street?

A. It rented for \$2,000, and rents now for \$1,200.

Q. What did it rent for in 1873?

A. \$2,200.

687

Q. No. 306 Pearl street, what did it rent for in '77 and '78?

A. \$1,600, and rents now for \$1,500.

Q. 130 and 132 Pearl street, what did that rent for in '77 and '78?

A. In 1877 \$6,360, and in 1878 it dropped to \$4,445. That is the year the road was built. There was a store vacant at the time.

Q. 244 Pearl street, what did that rent for in '77 and '78?

A. \$1,380.

Q. 46 Pearl street, what did that rent for in '77 and '78?

A. I didn't say anything about 46 Pearl, because that is not on the line of the elevated railway. That is 246, I guess. 246 rented in 1876, under a lease from '76 to '78, for \$1,992.

Q. 261 Pearl street, what did that rent for in '77 and '78?

A. \$2,400.

Q. 99 Pearl street, running through to Stone street?

A. In '77 and '78 it rented for \$4,000; now it rents for \$1,860.

Q. What did it rent for in 1873?

A. It was under a lease at that time. The average was \$3,900.

Q. 160 Pearl street, what did that rent for in '77 and '78?

A. \$3,350.

Q. 75 Bowery, the carpet store, what did that rent for in '77 and '78? 688

A. In 1878 it rented for \$6,500.

Q. Under an old lease?

A. It was a ten-year lease, from 1868 to 1878.

Q. What does it rent for now? A. \$4,200.

Q. When did it rent for \$4,200, when did the lease commence?

A. It rented in 1878 to 1882 for \$4,000; from 1882 to 1892 for \$4,200.

Q. No. 218 Bowery, what did that rent for in 1877 and 1878?

A. I don't know, sir.

Q. 108 Bowery? A. I don't know what it rented for in those years.

Q. 309 Bowery?

A. That I have not got.

A JUROR: Can you tell us the rent that Macy pays?

A. I cannot, for this reason, Macy leases the ground and he owns the building.

Q. Did he lease the ground before the elevated road came there?

A. Yes, sir; he had been there 25 or 30 years.

Adjourned to June 29th, 2 p. m.

June 29th-2 p. m.

HERBERT M. WARDLE, sworn for respondents.

Examined by Mr. Dickinson:

Q. What is your business? A. Insurance agent.

Q. Whereabouts is your office?

A. Our office is in Chicago, where I travel from.

Q. What is your business in Michigan? 689 A. A special agent.

Q. For whom?

A. For what is known as the Three Armstrong Companies.

Q. Will you name them?

A. The Mutual Fire, the Fire Association, and Armstrong Fire. all of New York. Q. You are the special agent in Michigan? A. Yes, sir.

Q. What are your duties?

A. My duties are to solicit business, make rates and inspect. Q. For those three companies you inspect and make rates?

A. Yes, sir

Q. And your companies all do business in Michigan under the State law.

A. Yes. sir.

Q. I think you have insured the Backus mill heretofore?

A. Yes, sir.

- Q. What is the rate as it stands? A. Three and a quarter per cent.
- Q. Have you been in the Backus mill?

A. Yes, sir.

690

Q. From your experience in insurance, what effect would it have on rates of insurance, or their being able to insure at all, if there should pass their mill on River street an elevated structure upon which three tracks and switch for changing from one track to another, also in front, the elevated track to extend so that the top of

the track would be 28 feet high on the front and in River street, spanning the entire curb, the tracks being laid upon a

structure spanning the curb, and the track being 13 to 18 feet in the clear from the roadway over which the track will pass, the trains with the locomotives attached of the D., L. & N., the F. & P. M., the Canadian Pacific, and the Wabash, with all the business that they do with the city in the way of passengers, and also including the local freight business of the two Detroit companies, this business to be conducted to enable these lines to reach the union depot on the corner of Third street, so that all the traffic in the way of passengers and in the way of freight for the two companies that I have stated, the trains being drawn by the ordinary locomotives, with all the care that could be taken and is taken in the matter of confining fires and shutting dampers, all that could be taken in such cases, what would be the effect upon insurance rates, or whether the property would be taken as a good risk by a company?

A. The physical hazard would certainly be increased, and the

rate would consequently be increased upon the physical hazard. My idea also would be that it would be what is known as a moral hazard attached to the risk by these roads going past, which does not exist at the present time. An increase of physical hazard and also of the moral hazard might make it undesirable for some com-

panies; for any companies, perhaps.

Q. To insure at all?

^{51 - 55}

A. To insure at all.

Q. Define what you mean in addition to the physical risk, which I understand to be the actual risk of fire from the locomotives; what do you mean by the moral risk?

A. It is taken into consideration by the companies, this moral The question is whether a risk is more desirable, partienhazard.

larly the sale to other insurance companies.

691 Q. And that is always considered in making insurance? A. Yes, sir.

Q. You think that many companies might not want to take such a risk on account of the danger

A. My idea is that there would be a great many that would not

take it that would write it now.

Q. From your knowledge of the matter, and your experience. I suppose you could not tell whether your company would take it upon your recommendation or not?

A. I could not say for certain whether they would or not.

Q. If you would take it, at what rate and the increase premium? A. I should increase it one per cent.

Q. If you took it at all?

A. Yes, sir.

Q. I believe in the insurance business, they do not take risks where they are so hazardous that you would increase it much more than that?

A. No, sir.

Q. If the risk is not good at four and a half per cent, you would not want to take it at all?

A. I think we have not a four and a half per cent. risk on our

books in my territory, to my knowledge.

Q. If the risk were such that you would want to charge four and a half per cent. it would be such a one as you would not care to take. You would not want to take any risk that any more would be charged upon at any rate?

A. No. sir.

Q. In your judgment, would the risk be increased to the maximum of your charge, four and a half, if you took it at all? 692

A. It would be increased to four and a quarter if I took it

at all.

Q. How much is it now? A. Three and a quarter.

Cross-examination by Mr. BAKER:

Q. Where do you live?

A. I live in Ionia, Michigan.

Q. How long have you lived there? A. Since the 8th of March, 1883. Q. Where did you formerly reside?

A. I came from New York city, there.

Q. You have your insurance office in Ionia?

A. No, sir, I travel from Chicago.

Q. You are a traveling agent?

A. Yes, sir.

Q. Who is your agent in Detroit? A. We have no agent in Detroit.

Q. Have you any risks in Detroit?

A. Yes, sir.

Q. Who wrote the Backus risks?

A. I did; the policies were written in Chicago.

Q. Did you fix the rate?

A. No, sir.

Q. Has your company a head office in Michigan?

A. No, sir.

Q. Have you an agent here in Detroit?

A. No, sir.

Q. Are you the only agent in Michigan?

A. Yes, sir.

693

Q. What risks have you in Detroit besides the Backus risks? A. It would take me quite a while to enumerate them. I have a number of them.

Q. How many?

A. I could not tell you that. Q. All written by you?

A. No, sir.

Q. Have you any risk in Detroit outside of the Backus risk, on a planing mill?

A. I think we had some on the Delta lumber planing mill; we

did have; I think we have yet.

Q. Whereabouts is that planing mill located?

A. At Delray.

Q. What is the rate on that mill?

A. I cannot call to mind what it is, but it seems to me somewhere about three and a half per cent.

Q. Don't you remember what it is?

A. No, sir.

Q. What makes you think it is three and a half?

A. As I remember it; of course I cannot remember the rates on all the risks we have.

Q. What makes you think it is three and a half?

A. It is in my mind as I remember it.

Q. Have you any risk on any planing mill that has no railroad connection?

A. I do not call to mind any that does not have some switch-

track running in near the mill. Q. Has a railroad running somewheres near it?

A. Yes, sir.

Q. Have you any risk on any planing mill in Detroit besides the Delta mill and the Backus mill?

A. We have some on the Yeomans and Chesbrough.

Q. Planing mill?

694

A. Yes, sir. Q. Whereabouts is that located?

A. It seems to me it is out on Fort street.

Q. East or west?

A. On Fort street west. Q. Is that on a railroad?

A. I think not.

Q. Do you know what the rate on it is?

A. The rate is 3.95.

Q. So that the further you go from the railroad, the higher the rate is?

A. No. sir.

Q. Can you tell me now how much of this 3.25 per cent. that you charge on the Backus property is due to the fact that the Michigan Central railroad runs alongside of it?

A. The Michigan Central affects it altogether in a different way. The Michigan Central does not affect it in such a way as this does,

Q. Then it is true, is it not, that the fact that the Michigan Central road runs right alongside of this property has not increased the rate?

A. I do not say that it has not.

Q. You say it does not affect it, you do not charge anything down there but the risk?

A. The Michigan Central was there long before the rate was fixed. Q. How much of this rate, this 3.25 per cent., is charged on the

Michigan Central?

A. I should say that the Michigan Central going past there was a minimum hazard compared to this.

Q. So that you do not charge anything for it?

A. I would say there was not anything charged for it. 695 Q. The way you estimate it, you do not charge anything

A. I said I did not make the rate on that mill originally. Q. I thought you said you did fix the rate on the Backus mill.

A. I did not.

Q. Who did fix the rate?

A. I don't know; it was fixed before my connection with the company.

Q. Did you issue a policy on it?

A. Yes, sir.

Q. How much of that 3.25 per cent. was for the increased hazard of the railroad?

A. I said I did not fix the rate.

Q. As a matter of fact, you do not consider the presence of the

Michigan Central there, as any increase?

- A. I do not consider it as increasing the hazard. It runs by it in altogether a different way. The railroad might run through this street and pass the city hall, but I would not consider it any additional rate.
 - Q. You went down there and looked at that property?

A. Yes, sir.

Q. The Michigan Central runs right alongside of it with half dozen or more tracks?

A. Yes, sir.

Q. And the property is exposed on that side?

A. Yes, sir.

Q. So that the smoke and sparks and cinders could be blown right into the building, and right onto their lumber piles, and onto the floors and everywhere?

A. Yes, sir.

Q. And as an insurance man you do not consider that as 696 increasing the risk?

A. I say it is a minimum hazard. Q. That is the smallest hazard?

A. Yes, sir.

A JUROR: Do your companies belong to the board of underwriters?

A. No, sir.

Q. Do you ever purchase rates of the insurance inspector here in town?

A. I never purchased any.

Q. You never got anybody here to do any inspecting for you? A. No, sir.

Q. Do you know Mr. Beveridge?

A. I used to work for him some years ago.

Q. You know that he has been an insurance inspector in this town?

A. I do.

Q. When your companies take risk you come here and attend to it?

A. Yes, sir.

Q. How often do you come here? A. I am probably here once a month.

Q. Have you got your rate book in your pocket?

A. No.

Q. What is the rate on a planing mill? A. It depends on the planing mill.

Q. Suppose it is an ordinary planing mill where they plane dressed lumber by steam?

A. There are a good many things to be taken into considera-First, the construction of the mill, and then the con-697 struction of the boiler-house, and then the cleanliness and the protection of it. There are a good many things to be taken into consideration. Planing mills vary all the way from one and a half

to ten per cent. Q. You think this railroad on River street would increase the

risk down there because it is going to be elevated?

A. That is one reason.

Q. You think the sparks would be more dangerous the higher up they are?

A. It is according to where they alight.

Q. In setting a fire, would it make much difference which story they went into?

A. That would depend on the material they came in contact

Q. Can't you see that the higher the sparks are here, the less danger there is from them?

A. No, sir. Of course, if you got them high enough they would

be dead before they reached the ground. Q. Don't you know that nearly all the sparks from a locomotive go out before the sparks are ten feet from the locomotive?

A. Yes, sir.

Q. So that the further they have to fall the less danger there would be from them?

A. That is the truth. If it were not true, that planing mill would

not stand ten hours.

Q. If there was any risk of that kind, the mill would burn up every 24 hours?

A. Yes, sir, unless they succeeded in putting it out. Q. Do you remember when a mill did burn up there?

A. No, sir, it was before my time.

Q. Suppose a locomotive were operated on this elevated 698 road, and they kept their dampers closed, or suppose they emitted no sparks, would it increase the risk?

A. They never did such a thing.

Q. Suppose they did, would the risk be increased?

A. If they would give me an indemnifying bond of \$68,000 that they would not emit sparks, I would not increase the risk. Q. Would it make any difference as to the risk what coal is

used?

A. I presume it does.

Q. Don't you know whether it does or not?

A. I never have examined all the coals that are burned.

Q. You are an insurance man? A. Yes, sir.

Q. Supposed to be an expert on fire risks?

A. I may be supposed to be; I never said I was.

Q. Your judgment-from what you do know about it, does it make any difference what kind of coal is used?

A. In my judgment, it does.

Q. Do you know whether anthracite coal can be used in locomotives?

I believe it is used in locomotives.

Q. What is the lowest rate on a planing mill?

A. I have seen them written at one and a half per cent. Q. Where they were detached from every other risk? A. Yes, sir, and equipped with automatic sprinklers.

Q. What do you mean by that?

A. It is a device for putting out a fire automatically.

Q. Suppose there is nothing of that kind, suppose it is an ordinary planing mill, and the only protection is the water works of the fire department?

A. The rates vary in different States; in New York State, and in

the East, they are written lower than here.

Q. In Michigan? 699

A. In Michigan, the standard brick mill would rate 2.75.

That is our standard rate.

Q. Are there any rules laid down by the company as to how you shall fix rates?

A. There are not with me.

Q. You have no instructions? A. I have my judgment, no instructions. Q. You have no written instructions? A. No, sir.

Q. Have you any printed instructions? A. No, sir; of course I have schedules. Q. Have you any verbal instructions?

A. No, sir.

Q. What are those schedules that you have?
A. They are planing-mill schedules, and saw-mill schedules, etc. They are seldom used, if at all, and always vary them according to my judgment.

They are instructions that are issued that you do not use? Q. They are instructions that are issued that you do not use? A. They are not instructions. They are not given to me. They are something that I have gotten myself.

Q. Tell what they are.

A. Charging so much for a smokestack going through a roof, so much for the absence of a stand-pipe, so much for certain construction of the boiler.

Q. Have you got one of those in your pocket?

These are not mine; they do not belong to any par-A. I have. ticular company, and it is something that I probably have not looked in inside of six months.

Q. I suppose you are so familiar with it that you do not have to

look into it?

A. I do not read it. 700

Q. Was that issued by one of your companies?

A. No, sir.

Q. Issued by the Mutual Fire Association of Chicago; do they use it?

A. I don't know; it is not used by my company.

Q. Where did you get it?

A. I can't say that; I can't remember.

Q. What did you get it for?

A. I got it for reference. There are some very good things in that book. It may be instructive.

Q. You carry it around for reference?

A. I carry it around.

Q. Do you regard this as good authority?

A. Pretty good, as good as any schedules are. As I say, schedules won't apply to every risk.

Q. Risks vary?

A. Yes, sir, and they vary in different States. The law of hazard is the same, however.

Q. Is there any difference between a furniture or chair factory and a planing mill?

A. Yes, sir.

Q. Which is the more hazardous?

A. It depends altogether upon circumstances. If you take the Standard Furniture Company without any finishing done in it, and construct it the same as a planing mill, the hazard will be about equal. There is almost always finishing done in a building in a furnishing factory.

Q. Would you call Backus' planing mill a standard planing

mill?

A. No, sir.

Q. What would you call it?A. It is a little too high for a standard mill. 701

Q. Too many stories?

Q. How many stories would there be in a standard mill?

A. A standard planing mill, according to my idea, would be one story high.

Q. Page 36 gives the rates for a standard planing mill, does it not?

A. Yes, sir.

Q. Does it make any difference whether the building is brick or stone?

A. Not in the rate. In brick and frame of course there is a difference.

Q. Is this book correct when it says that the only basis on each \$100 of insurance on a standard steam-power planing mill is 2.50?

A. I don't use that as of any authority at all.

Q. Is that correct?

A. I might rate it at 2.50 and I might not, and I might rate it lower, or I might rate it higher.

Q. I do not speak of the other things that enter into it, but they start out with that as a basis.

A. That book does.

Q. And then they add for the others?

A. Yes, sir.

702

Q. And when they fix the rate at 2.50 they refer to a one-story planing mill made of brick or stone, the framework solid and substantial, the floors heavy, with tight joints grouted, the roof metal or metal rafters, all inside work whitewashed and painted and kept clean and no open lights, and there are provisions about boiler-

house and shaving-rooms?

A. That would be a standard mill.

Q. If it came within those terms the rate would be 2.50?

A. That is the schedule in that book.

Q. That would be about right, would it not?

A. That would be pretty nearly right.

Q. That would accord with your judgment?

A. Pretty nearly so, but the conditions might vary it some.

Q. If the building were of wood, instead of brick, or partly wood, you would increase the rate, would you not?

A. Yes, sir.

Q. If the building had simply a gravel roof, would you increase the rate?

A. No, sir.

Q. If the rafters were wood, would you increase the rate?

A. No, sir; I know it says so in that book, but I would not increase it.

Q. For each story above one you would add 20 per cent, would you not?

A. I might and I might not; I probably would.

Q. That is the authority here, is it not?

A. Yes, sir; it would certainly increase the hazard.

Q. If you started out with 2.50 and there were two stories, you would make it 2.70, three stories 2.90, and so on?

A. That is what I would by the schedule. .

Q. That accords substantially with your judgment, does it not?
A. It depends; of course we could not add twenty cents to every story to every building, because you would get the rate way out of sight.

703 Q. You get them up pretty well anyhow, don't you?

A. Sometimes.

Q. Will you look at that schedule and see how much you add, according to the schedule, from the fact that the railroad runs

alongside of the property?

A. There is nothing in any schedule; there is no schedule for railroads; no schedule for any dirt in a planing mill. There is no schedule for a thousand things; there is no schedule for a dozen barrels of naphtha in a building.

Mr. Dickinson: Any schedule for a powder mill next door?

A. No; there are lots of things that you cannot provide a schedule for, that it would be injustice to the risk, either to the companies or the assured, and, as I say, I do not follow any schedule.

Q. Where is it in this book that you do refer to railroads?

A. It does not refer to railroads in this book, or any book that I know of.

Q. When did your company first insure this property?

A. I first went with these companies on the first of January; on the 29th of December, 1890, the first risk was put on in the fire association.

Q. Have you any risk on the lumber yard below, on Eighteenand-a-half street?

A. No.

Q. How much risk have you got on the planing mill?

A. Upwards of \$60,000; I think \$68,000.

Q. In all three of the companies?

A. Yes, sir.

Q. Have you the total insurance on the mill?
A. I believe the total insurance is \$88,000.

Q. How long prior to the first of January had these companies insured it?

A. I think the first risk was put on by the fire association December, 1890.

Q. You have only had this risk a short time?

A. That company reinsured in the Western Manufacturer at that time.

Q. Did you come down here and negotiate this insurance?

A. The Western Manufacturer was down here at that time. I did not come down then.

Q. I am trying to find out who fixed the rate.

A. That is beyond me to tell.
Q. Did Mr. Beveridge fix it?

A. No, sir.

Q. Can you tell us some way of finding out who fixed the rate?

A. Mr. Backus perhaps can; I cannot. This was in the Western Manufacturer. The Western Manufacturer was represented by D. A. Montgomery & Company, of Chicago. He insured this Backus mill in the Western Manufacturer. When they reinsured the fire association took it at the old Western Manufacturer rate, and that had stood until this time, and is now standing.

Q. You don't know how long that rate had been fixed at 3.25?

A. No, sir.

Q. You think the Delta pay 3.50 and the Yeomans & Chesbrough 3.95?

A. Yes, sir.

Q. Are those the only other planing mills in Detroit that you insure?

A. Those are the only ones I call to mind that I insure. I believe the only ones I have in the city.

Mr. Charest: If the elevated railroad should pass on the margin of the Michigan Central, would it then increase the risk on Mr. Backus' mill?

A. Which side?

Q. The south side.

A. Closer to the building, you mean?

Q. I mean where the Michigan Central passes now. If they should elevate it on that side?

A. Over the Michigan Central yard?

Mr. Baker: Put it in this form: It would be 40 feet further

away; that is all.

Mr. Charest: What I mean to say is this: Here is the building, it passes right on the street, just 24 feet from the building. Suppose it leaves the street clear. On the other side of the street the cars pass. There is a distance of 64 feet; would that increase the rate? You said that the Michigan Central, where it is, does not increase the rate.

Mr. BAKER: There is a yard on the other side he is talking

Mr. Charest: Allow me, please. Here is the street, we will say; here is the Michigan Central yard; here is the Backus mill where

my hand is. You said that the Michigan Central, passing their cars here, they do not add to the risk?

A. Yes, sir.

Q. Suppose they elevate the railroad on the Michigan Central ground, what difference would there be in the risk?

A. Being 64 feet off from the building, I should not say that that

would increase it.

Redirect by Mr. CHIPMAN: 706

Q. Suppose it goes on the inside of the Michigan Central ground?

A. And as far away from the mill as the Michigan Central?

Q. On the other side of the street, 64 feet off.

A. No, sir, it would not increase it.

Q. If it were 64 feet off further than it is now it would not increase the risk?

A. No, sir.

Q. In regard to this book, the schedule, as you call it, what has that to do with you?

A. It has nothing to do with me; I use it sometimes.

Q. Are there any instructions in there that you are bound by?

A. No, sir.

Q. Is it used by your company?

A. No, sir.

Q. Do you feel bound by it in any way?

A. No, sir.

Q. Can you tell the jury how much insurance you have in the city of Detroit, as near as you can come to it?

A. It would be very difficult; I think it would exceed a million

dollars, anyway.

Q. How much in this State?

A. Our premiums in this State will be in excess of \$50,000.

Q. About what insurance, do you think?

A. Probably over three millions.

Q. You said you considered the situation of the Michigan Central, as it passes that mill now, as being a minimum risk?

707

A. Yes, sir. Q. Will you tell me what the difference between that risk is, and the risk which will come from the elevated road passing as

it is proposed to pass in front of that mill?

A. In the first place, the Michigan Central comes up on a level track; this comes on an elevated track; the freight trains, pulling up the grade, as I understand it, fifty feet to the mile, it makes a pressure on those engines that is not there on the level track, and of course naturally, they puff harder and are more liable to throw sparks. And another reason, it comes by the most hazardous part of the plant.

Q. What do you mean by that?

A. I mean it goes right by their shaving vault, which is the most vulnerable point in their wood-work.

Q. Do you know where their dust shaft is?

A. Yes, sir.

Q. How about that?

A. That is what I mean by their shaving vault.

Q. The body of the mill is between that and the Michigan Central tracks as it is now?

A. Yes, sir.

Q. But this track will come right alongside of it?

A. Yes, sir.

Q. Are there any other reasons that you can give?

A. A spark in that shaving bin and that sawdust is like powder. I have known it to explode and burst a building all to pieces.

Q. Did you ever know of a planing mill or other property being

burned by sparks from a locomotive?

A. Yes, sir. If you can know anything of the way of the origin of a fire.

Q. Where?

708 A. About six weeks ago.

Q. Where?

A. Kokomo, Indiana. I went to take a train and the depot was all burned up. I went to the office to buy my ticket and I asked several bystanders what had become of their depot, and they said that previous, some time in May, a freight train had gone past and thrown a spark on the roof, and they were lamenting their depot. This was on a level track. I did not actually see it, but that is what they told me.

Q. Do you know of any instances where losses were settled on

the ground of the fire originating from locomotives?

A. Yes, sir.

Q. When and where?
A. I have a list of some.

Q. Explain it to the jury.

A. I have a list of losses that were paid by the companies that I then represented.

Q. Explain it to the jury.

A. I have a list of them. Nov. 26, 1886, S. G. M. Gates, Bay City flour mill, sparks from switch-engine set-fire; June 25, 1887, April 23, 1888, United States Rolling Stock Company, Hedgewitch, Illinois; July 27, 1888, George Hazard, Buffalo, New York, sparks from engine set fire to tannery; November 1, 1888, Chicago stove works, passing locomotive set fire to building; November 19, 1887, milling company, Akron, Ohio, switch-engine set fire to tramway and communicated to cooper shop, and came near burning their mill.

Q. You speak of this flouring mill at Bay City; how did the fire communicate there; do you know anything about that?

709 A. No, sir.

Q. Do you know whether it communicated from one of those locomotives provided with a patent apparatus for preventing sparks and cinders on the F. & P. M.?

A. I have been given to understand that all locomotives have

patent appliances to prevent sparks.

Q. In insuring, practically, how much reliance do you place upon those appliances?

A. Of course, I place quite a little reliance on them, but I do not

think they are infallible by any means.

Q. Do you know whether they are infallible?

A. I know that sparks come from them.

Q. You know of instances in which those sparks have set fire?

A. Yes, sir.

Q. Where you consider it of some protection, you do not consider it an absolute protection?

A. No, sir.

Cross-examination by Mr. Baker:

Q. You heard of a depot burning up in Kokomo, Indiana?

A. Yes, sir.

Q. Somebody told you it was set on fire by the railroad?

A. They said they saw it set on fire.

Q. What railroad was that on?

A. Lake Erie & Western.

Q. Is that the only depot that you ever heard was fired by a railroad?

A. That is the only one that I remember of.

Q. You travel a great deal, don't you?

A. Yes, sir.
Q. You have been a great many miles on the railroad? 710 A. Yes, sir.

Q. How many years have you been traveling?

A. A little over three.

Q. Mostly in Michigan? A. All over the United States.

Q. Depots are generally located right alongside of the railroad?

A. Yes, sir.

Q. That is the only one you have heard of being burned?

A. I never inquire about them.

Q. And you were told that by the bystanders? A. Yes, sir, this came under my immediate notice.

Q. What is that list you read from?

A. This was taken from the books in the office of the Western Manufacturer.

Q. Do you know anything about it?

A. I simply know that the company paid losses on those.

Q. Your companies?

A. Not the companies I am with at present, but the company I was with.

JUROR: Do you estimate losses for the company?

A. No, sir.

Q. Who sent you this?

A. George B. Barr, our assistant manager.

Q. Of what company?

A. Of the companies I am now with. He was formerly secretary of the Western Manufacturer.

Q. Do you know anything about this flouring mill at Bay City, how close it was to the track, or how well it was protected from fire?

A. No, sir, I never saw it.

Q. All you know about it is that this man writes you that 711 they paid a loss on a flouring mill where it was supposed it was set on fire from a switch-engine?

A. Yes, sir.

Q. You don't know anything about what engine it was?

A. No, sir.

Q. Or what railroad it was on?

A. No, sir.

- Q. That was in 1886, and in 1887 you say it was reported that your company paid a loss on the United States Rolling Stock Company at Hedgewitch, Illinois, sparks from their locomotive setting fire to grass, which communicated to the fence and then to lumber. which caused quite a heavy loss; that was their own locomotive then?
 - A. It may have been their locomotive.

Q. That is what it says, isn't it?

A. It may have been their locomotive.

Q. Do you know whether they had any appliances on it it at all for arresting sparks?

A. As I have said, I have been given to understand that every locomotive has spark-arresters.

Q. How many do you know that has spark-arresters?

A. I understand all of them.

Q. But you know, do you not, that a great many of them have imperfect apparatus?

A. I believe so.

Q. And a locomotive, if it were used in some yard by a rolling-

mill company, would be very apt to be imperfect?

A. There was a railroad man very high up who told me yesterday that they could not run 24 hours without some device to protect them from sparks.

Q. You understand there is a great protection in it?

712 A. I say there is.

Q. In 1888 there was a loss in Buffalo, sparks from an engine set fire to a tannery; do you know whether that means a locomotive engine or their engine?

A. I never saw a tannery engine that would throw sparks, because

they are built differently.

Q. November, 1888, the Chicago stove works, passing locomotive set fire to building; you don't know anything about that either, do you?

A. No.

Q. You don't know what kind of a building it was, or what kind of a locomotive it was, do you?

A. No, sir.

Q. November 19, 1887, Seberling Mill Company, Akron, switchengine set fire to tramway and communicated to a cooper shop, which was destroyed, and came near burning their mill. Do you know anything about that engine, what railroad it was on, or anything of that kind?

A. No, sir; I presume they were all provided with spark-arresters.

Q. These were not taken from the reports of your companies?

A. The companies I was with previous.

Q. Was not that taken from the insurance reports of the United States?

A. No, sir.

Q. Do you swear, sir, that that is not what this language means: "I have culled out from our annual reports a list of fires that were started by railroad companies using coal." What does he mean by "our annual reports"?

A. The annual reports issued by the companies of the fires they

paid losses for.

713 Q. Have you one of those reports?
A. No, sir, I can easily get them.

Q. What do these initials mean? A. G. J. Harr.

Q. Where does he live?

A. In Chicago.

Q. Hiş address is in Chicago?

A. 1005 Home building.

Q. Did you write to him for information?

A. I wrote to him for a list of losses by locomotives, if he knew of any.

Q. Is that all he sent you?

A. He said that was all he had time to look up.

Q. What is his business in Chicago?

A. Insurance business.

- Q. How long has he been in the insurance business?A. I have known him in the business for three years.
- Q. You don't know how long he has been in the business?

A. No, sir.

Q. I suppose it would be your opinion that the risk down there would be increased if the Michigan Central tracks that run along the side of the Backus building were elevated?

A. I don't think so, necessarily. It might be to some extent, but

not very much.

Q. So that you would not increase the risk, specially, because the railroad happened to be elevated?

A. Well, that would depend somewhat. If it acted exactly like this does it might affect the moral hazard, as I said this one would.

Q. Suppose this road ran along on the surface of River street, would the risk be any less than it would be running on an elevated superstructure?

A. There would be this difference, if it runs up a grade, I don't care how it gets up that grade, it is more liable to throw sparks if it has to run up an elevation.

Q. Do you know what the grade is going to be in front of that property?

A. I know they tell me it is going to be about 52 feet to the mile.

Q. You don't know whether this is so or not?

A. I never measured a mill. Q. The road is not built?

A. I can only tell you by what they tell me.

Q. So that they have informed you as the basis of your testimony, that the locomotive, when it is in front of the Backus property, will be going up a grade of 52 feet to the mile?

A. So I have been informed.

Q. And you think that would increase the risk over what it would be if they were to run at a level, or nearly at a level?

A. Certainly.

- Q. Would the rate be any less if they ran at the same grade, on the surface of the street, or substantially on the surface of the street. I want to find out your opinion as to which would be the greater risk?
- A. If they ran up a hill, it is not my idea so much as the sudden elevation that gives the hazard, because the sparks will be just as liable to go into shaving bins, if it was on a surface, of course, but the sudden pull up there makes a difference.

Q. Their shaving bin has a solid wall on the street side, has it

not, with the exception of some doors?

715 A. Yes, sir.

Q. There are no windows in it?

A. No, sir.

Q. They use the door to draw the shavings through?

A. Yes, sir.

Q. As a matter of fact, if the engine ran right along the street, the risk of setting fire in that shaving bin would be greater than it will be when the elevated road is built up there, with the bottom of the engine 25 feet in the air?

A. The mere fact of the difference in height, yes.

Q. That would be a protection, would it not, to some extent?

A. To some extent.

Q. That is, before it could get down to this door, the sparks would have to fall a great deal further?

A. Yes, sir.

Q. About 25 feet?

A. Yes, sir.

Q. This is a big building?

A. Yes, sir.

Q. It has a gravel roof?

A. Yes, sir.

Q. Suppose that side of the building is fireproof, except as fire might be set to the shavings, if they were not kept cleaned up around the door. Do you know whether it is fireproof?

A. I suppose that side of the shaving vault is. Q. It is a solid building on the side, is it not?

A. Yes, but it is not solid on the roof.

Q. That is further back?

A. Yes, sir.

Q. When you come to the open part of the roof, it is not close to the railroad?

716 A. It is close enough.

Q. But still it is some distance back?

A. Yes, sir.

Q. Do you know anything about a dust-room?

A. Something.

Q. Do you know whether or not that dust-room is properly constructed?

A. The shaving vault?

Q. No, I mean the apparatus they have with canvas on it.

A. The dust-arrester?

Q. Yes; do you know anything about the structure of that?

A. Yes, sir.

Q. That dust-arrester, on the end that faces River street, is a solid brick wall, is it not?

A. I think not; I think it is covered with iron.

Q. And the slats that bring the air into the dust-arrester, are they at right angles with the street?

A. Yes, sir.

Q. You say you will increase the rate one per cent. How much of that one per cent. is occasioned by the fact that the road there will go up a grade 52 feet to the mile?

A. Of course, in fixing that rate, I took everything into con-

sideration.

Q. You must have some idea of how you divided it up. It was not all on account of one thing?

A. It was all on account of the whole.
Q. You have fixed it at one per cent.?

A. Yes, sir.

Q. And one of the things that you have taken into consideration is the fact of their going up a grade of 52 feet to the mile.

A. Yes, sir.

Q. Would that account for one-quarter of it?

A. Of course it would not be so hazardous if it did not go by in

that immediate locality.

- Q. I know, but you are figuring on the theory that it will increase the risk one per cent. I want to find out what elements enter into that one per cent., for one reason, to see how far they could be avoided.
- A. I suppose they could be avoided by changing the character of their business entirely.

Q. They would not have to change it entirely, would they?

A. Nearly so.

Q. It is possible for them to have a shaving-room in some other

place on their large property?

A. It would be very difficult for them to, without destroying their

business entirely, or rebuilding their plant. Q. You think so, do you?

A. I think so.

Q. You mean they could not locate a shaving-room on that 53-55

property in any other place without destroying their business, or having to rebuild their plant?

A. Their shaving vault has to be contiguous to the boiler-house.

certainly.

Q. Do you think there is any practical difficulty in avoiding the

risk connected with the door to that shaving-room?

A. That is a question for Mr. Backus to answer. I cannot say. Of course, I don't know their business. I merely take into consideration the fact of the things as they are.

Q. You do not take into consideration any extra precautions, or

anything that would be done to avoid any loss?

718 A. If there were any way that they could conveniently do it.

Q. What do you think they would have to do about that shaving. room to avoid any risk from it?

A. In the first place, they would have to block up the door, certainly.

Q. Would they have to? Would not this be sufficient, merely

to keep the shavings away from the door?

A. They have the door open.

Q. They load shavings there, but if they kept the shavings swept up?

A. The door is open all the time while they are loading the

Q. There are men right there all the time while they are loading?

A. The mere fact of men being there does not obviate the

hazard.

Q. How much of this one per cent. is on account of the grade?

A. I cannot say that I picked it out in that way.

Q. How much is on account of the location of the shaving-room?

A. Considerable.

Q. Seventy-five per cent.?

A. If they had an absolutely fireproof shaving-room of course the

hazard would not be so great.

Q. You are fixing it upon the property as it is now situated without any changes, and you fix it at one per cent. How much of it is because the shaving-room exists as it does and will be close to the railroad?

A. Of course there is quite a little difference.

Q. Half of the increase would be due to that?

719 A. Yes, sir.

Q. How much of the increase is due to the fact that the dust-arrester is situated there as it is?

A. I say the dust-arrester and the shavings both, taking them

together.

Q. You make that one-half of one per cent.?

A. Yes, sir.

Q. Where do you get the other half per cent.?

A. For the grade.

Q. One-half is because of the location of the shavings-room and

the dust-arrester, and the other half is for the grade of 52 feet to the mile?

A. Yes, sir; saying they can get a fireproof shavings-room.

Q. I am taking it as it is. I suppose there is such a thing as a fireproof shavings-room?

A. I have never seen one.

Q. You are talking about it; I am not saying anything about it. Is there such a thing?

A. There might be one from the outside exposure. There could not be from an inside fire. You might make a fireproof shaving-room.

Q. You can make a building that, as far as the building is concerned, the ingress into the shaving-room is concerned, is fireproof,

can't you?

A. I suppose you can.
Q. Of course if you set fire to shavings they will burn?

A. Yes, sir.

Redirect by Mr. CHIPMAN:

Q. This list of fires caused by locomotives, which you gave us, you got from a gentleman connected with the company for whom you used to work?

A. Yes, sir, and he is now assistant manager of our com-

pauy.

720

Q. I understood you to say these were all that he had time to look up?

A. Yes, sir,

Q. In regard to fire, would not that elevated structure have a tendency to prevent engines—fire apparatus—to work at a disadvantage in extinguishing the fire there, being so near and close up to the building in front; the track on one side and this structure on the front, would it not operate somewhat as telegraph wires?

A. Of course it would interfere to some extent; there is no ques-

tion about that.

Q. How could they get a ladder apparatus there under that elevated way; how could they operate a hook-and-ladder apparatus under there; how could they bring one of those big ladders which they elevate under that structure?

A. I don't know whether they could do it or not.

Q. Don't you know they could not do it?

A. I don't believe they could.

Q. Would you not take that somewhat into consideration in a town where there was a fire department, in regard to a loss, the extent of a loss, the possibility of saving part of a property?

A. Of course, that is taken into consideration to some extent. Q. Suppose this grade is 52 feet just about up to the place where the track strikes in front of this property, the locomotive goes upon a level and all the rest of the train, however long it is, is on the grade, would not the objection you make on account of the grade continue to exist until all the cars were pulled up to the top?

721 A. Yes, sir.

Q. In regard to the case put to you by my brother Baker, of there being men around the shaving-room when the door was open on the ground floor, if a spark of fire got in there, what would become of the men?

A. It would be so much the worse for their being there, and it

would not help the property any.

Q. They would probably be killed?

A. They probably would unless they were pretty fast runners.

Q. Don't you know that it is necessary at the top of this dust-room to have openings to prevent the roof from being lifted off by the immense draught they have?

A. Yes, sir.

Q. Do you know of any dust-room being conducted without these openings from the external air, allowing it to come in?

A. No, sir.

Q. It cannot be done, can it?

A. No, sir.

Q. Where the dust-room is so high up, and the openings in the roof are so high, would there not be more danger from an elevated road than from a road on the ground?

A. Yes, sir.

Q. The gentleman has asked you if Mr. Backus could not by proper protection, or by changes, obviate the danger from this structure. You know the situation of that company in regard to the Central road, the dust-room as it is now is put clear on the other side. The dust-room has to be near the boiler and the fire, and that is on the other side away from the Central railroad, so that the

dust-room is carried at present as far from the railroad as they can get it upon the property. After you looked that property over, can you tell any other place where they can

put that dust-room?

A. As I told Mr. Baker, I do not see how they could change it. Q. If they pulled the whole mill to pieces and shoved everything around, where could they put it, to be free from the Central road and this road too?

A. I don't see how they can do it.

Q. You don't know that the locomotive never comes on that side track from the Michigan Central; it does what they have to do by what they call kicking the cars off. You don't know anything about that, do you?

A. No, sir.

Q. But you do know that the dust-room, as now constructed, is on the opposite side of the lot from the present railroad?

A. Yes, sir.

Q. And you do know that this structure will bring the dust-room right opposite to it—this new structure?

A. Yes, sir.

A JUROR (Mr. Wallich): I would like to know if the rates of insurance will be reduced if you cover the openings on the dust-room with wire netting?

A. No, sir.

Mr. CHIPMAN: Do you know anything about that?

A. It would depend something on the kind of netting that was put in there, of course. You could not stop up the holes.

Q. Do you know the practicability of doing that?

A. No, sir, I never saw it.

Q. Do you know whether a netting fine enough to obstruct any sparks that would get into the opening on the top of the dust-room—do you know whether any netting that would arrest the sparks would be open enough to give a proper

draught?

A. I am afraid it would not.

Q. They have to have a free draught?

A. Yes, sir.

Q. It would have to be a pretty fine netting?

A. Yes, sir.

Q. Did the railroad company settle with the insurance companies

for the fires that you have stated?

A. I cannot really tell you whether they did or not. Of course the insurance companies, as a general thing, whether a railroad or an incendiary sets fire, they generally pay.

Q. The railroad companies must have settled with the insurance

companies?

A. The origin of a fire is the hardest thing to prove in the world. It is almost an impossibility to eatch an incendiary, even if you see him going into the building with a match in his hand.

Q. About how much of the property is insured; about how much of the risk does the company take, and how much do they leave on

Mr. Backus?

A. I should say they left on Mr. Backus somewhere in the neigh-

borhood of \$60,000.

Q. Sixty thousand dollars he would get no insurance for if the building burned down?

A. No, sir.

Q. Would be get \$68,000 if the insurance company should fail?

A. These companies carry an insurance policy, they reinsure in

another company.

724 Q. If the insurance companies became insolvent, he could not get anything?

A. No, sir.

Q. Suppose the insurance companies should differ as to the cause of the fire, and have a long litigation, then where would he be?

A. He would be out of course the interest on his money.

Q. His property is not insured, in your judgment, to within \$65,000 of its full value; he must take the risk of the solvency of the company, and he must take the risk of the willingness of the company to pay promply and at once?

A. Yes, sir.

A JUROR: Suppose the mill should be totally destroyed by fire, how much of the insurance would you pay on the loss?

A. We would pay \$68,000.

Q. How would you estimate that loss?

A. We would estimate the loss at the value of the property.

Q. What value the property had?

A. Yes, sir.

Q. How much do you value the property at? A. I never have taken any inventory of it.

Q. How can you tell how much to pay?

A. It would be estimated then dollar for dollar.

Q. You say you would pay \$68,000? A. Yes, our policies provide for a loss of \$68,000.

Q. They must prove their claim that they have lost that much? A. Yes, sir.

Q. You stated they would pay that amount? A. Provided they lost that.

725Mr. CHIPMAN: Did you ever know of any insurance company recoving a loss from a railroad company for the property set on fire by a locomotive?

A. I have known of suits.

Q. Did you ever know of a railroad company to be beaten in a suit of that kind?

A. I never did.

Q. Did you ever hear of one?

A. No, sir.

Mr. WALLICH: I believe I understand the shavings-room as well as anybody except Mr. Backus, the inventor. There is no wind necessary from the outside. The pressure is from the inside. The fan creates enough pressure with the dust and shavings from the inside and that surplus of wind has got to pass through the burlap, that is what that burlap is for, to let out the air, and if the outside of that building were covered with a wire mesh, fine musquito bars, it might be ever so fine, it would let out a hundred times more air than the burlap, and I want to know if a building were covered that way, if it would not reduce the insurance on it?

Mr. CHIPMAN: Would not the effect of the wire netting be to

arrest the dust there?

Mr. Wallich: There is no dust there.

Mr. CHIPMAN: There would be so much obstruction.

Mr. Wallich: The burlap catches all the dust.

Mr. CHIPMAN: Would not the wire netting - an obstruction? A. It seems to me it would. It certainly would in addition to the burlap.

Recross-examination by Mr. BAKER:

Q. Have you had any occasion to examine dust-rooms as they are constructed?

A. Somewhat.

Q. Would you undertake to express any opinion as to how this dust room could be arranged so as to avoid any danger to a railroad?

A. The only way that I could see was the way I talked to Mr. Backus about, and he says that he has tried it and it cannot be done.

Q. What is that?

A. With the Allington & Curtis dust-collector.

Q. What is that?

A. A metal arrester.

Q. All there is to this dust-arrester is a room in which the shavings and dust are blown by a blower, and the top of it, where the burlap is, is a small place for the surplus air to escape.

A. To collect the dust.
Q. You collect the dust on the inside, and the air comes through the burlap, and you keep the dust on the inside. There is very little if any dust that goes through the burlap. The burlap is there to stop the dust?

A. Yes, sir.

Q. There is open lattice-work so that the pressure upon that dustroom from this blower is constantly forcing the air through the burlap?

A. Yes, sir.

Q. So that as far as the dust-room itself is concerned, it would be an impossibility for the fire to get into the dust-room; the pressure is the other way all the time, is it not, blowing it away?

A. Yes, sir.

Q. Blowing it out, you say it is impossible for a spark to get in? A. Yes, sir. Do I understand you that it would be im-727 possible for a spark to get in?

Q. Yes. A. No, no, sir.

Q. How would it do it?

- A. If it got in there through those blinds, it would soon get in there.
- Q. With the air being forced out it would be difficult to get it in except with a pile-driver?

A. The air won't blow out before it will get into the dust-collector, before it would get between the blinds.

Q. You think the spark might lodge on the burlap? A. Yes, sir.

Q. Is there not air coming through the burlap?

A. That won't help matters.

Q. That would keep the spark from lighting on the burlap?

A. I think not.

Q. Why not?

A. Because it would not.

Q. And the burlap is up and down, is it; it is not horizontal?

A. No, sir.

- Q. And there is an open space that a man can walk through in which the air is coming through the burlap and going out through the lattice-work?
 - A. I would not want to try to put any sparks on the burlap.

Q. You could not put one there if you wanted to?

A. Yes, I think I could.

Q. Suppose it got through the blinds, it would go right through on the other side, wouldn't it?

728 A. It might.

Q. You could not get it to stop on the burlap with the aigoing through the burlap and swelling it out; how would you sto a spark on that burlap, take and pin it on?

A. I probably would not try to.

Q. Do you mean to say you do not think it practicable to put wire netting, put it a foot or two from the lattice-work, so that you could have plenty of air in there, in fact there is a surplus of air all the time, you have to have a place for it to escape, and if you have it covered with the netting to set it on fire from sparks; is not that true?

A. I would not say it would be impossible.

Q. With your spark-arrester, or with the lattice-work situates there as it is, with the end of the building towards the railroad there would be no direct current right from the smokestack interest that lattice-work anyhow, would there; it would have to be a lateral connection in some way?

A. It would depend a good deal on the way the wind blew.

Q. If it blew diagonally across there in any way, the full force of the wind would not go into that lattice-work?

A. If the wind blew directly across the lattice-work; the win

might blow diagonally.

Q. If it blew directly against the end, there would not be an danger, and if it blew diagonally towards it, it would not be lik blowing straight on and into it?

A. Pretty nearly the same; I cannot see the difference.

Q. There would be some difference though, would there not; dyou think that is just as dangerous as it is situated there now as i would be if it stood longitudinally with the track; suppose

you turned the arrester right around, would it not be a great

deal more dangerous position than now?

- A. If course; if it were directly sidewise, it might be a littl worse.
 - Q. It would be a great deal worse, would it not?

A. Not very much.

Q. You take it diagonally it is a broad surface to catch?

A. Yes, sir

Q. It would be the same breadth if it was longitudinal, and it would be more direct?

A. Yes, sir.

Q. Have you had any experience on elevated roads anyway insurance?

A. Not in insurance.

Q. Were you ever in Newburgh, New York?

A. I have been through there. Q. On the West Shore road?

A. Yes, sir.

Q. Don't you know that railroad was built right through the city of Newburgh upon an elevated structure?

A. Yes, sir.

Q. Don't you know, as an insurance man, that not a single rate was increased in that city on account of it?

A. I never wrote any buildings in Newburgh, and therefore I

can't tell.

Q. Don't you know, as an insurance man, that they built that railroad right through the city on an elevated structure, and not a single insurance rate in the entire city was increased on account of it?

A. I don't know that.

Q. You are a pretty well-informed insurance man?

A. Yes, sir, but I have never written insurance in New-730

Q. You know that Mr. Beveridge formerly lived in Tewburgh and did business there?

A. I don't remember; I may have known it.

Q. You recognize him as a good insurance man, don't you, a competent man?

A. As a statistician, yes, sir.

Q. What do you mean by that? A. I mean that he is more statistical than he is practical.

Q. That is, he keeps the records well?

- A. I mean what I say. I cannot describe it in any other way.
- Q. You know, do you not, that he has been an insurance inspector in this city for three or four years past?

A. Yes, sir.

Q. You know what his position has been?

Q. He has done business for a large number of companies? A. Yes, sir.

Q. Were your companies ever in the board of underwriters here?

A. No, sir.

Q. Were your companies members of the insurance bureau that is organized here after an act of the legislature had been passed a few years ago?

A. No, sir.

Q. You have your appraisers outside?A. Yes, sir.

Q. Doing an itinerant sort of business through the country; you never went into the other companies?

731 A. No, sir.

Q. Don't you know that Mr. Beveridge is practically the rate-fixer for the insurance companies in this city?

A. Yes, sir.

Q. I suppose the insurance business here would compare favorably with the business in Ionia?

A. It might.

Mr. Dickinson: Do you know that Beveridge fixed any rates for anything but his own company?

54 - 55

A. I don't know anything about what companies he fixed rates

JOHN B. ELDERT, sworn for respondents.

Examined by Mr. Dickinson:

Q. Where do you live?A. Eighty-four Perry street.Q. What is your age?

A. Forty-four.

Q. What is your business? A. Locomotive engineer.

Q. How long have you been a locomotive engineer?

A. About 12 years.

Q. What roads have you been on?

A. The Michigan Central, Detroit, Bay City & Alpena, Toledo, Cincinnati & St. Louis, and Houston & Texas Central.

Q. What business were you engaged in before you were a locomotive engineer?

A. Fireman.

Q. How long have you been in the railroad business upon au engine? 732

A. Sixteen or 17 years.

Q. Where were you last engaged in the business?

A. On the Texas Central.

Q. What is your business now?

A. I am not doing anything at present. Q. Where were you last in business here? A. I was in a store here last time.

Q. Were you ever on the Michigan Central? A. Yes, sir. Q. When?

A. From 1876 to 1882.

Q. Have you been about yards at all since you have been here this time?

- A. Yes, sir.

Q. Familiar with the boys? A. A great many of them.

Q. Know the running of the business?

A. Yes, sir.

Q. Go upon locomotives frequently?

A. Yes, sir.

Q. Do you know whether the Michigan Central provides any method on the locomotives for the arrest of sparks and cinders?

A. In some kinds of engines they do. Q. Give us the nature of that device.

A. They have an extension front end, and netting that goes across that way, and another netting that goes up and down. The cinders first strike the draft section, and then go down and up through the netting until they go out. When they get full they go out.

Q. State to the jury whether it is substantially like this (showing witness the cut of the engine of the F. & P. M.)?

733 A. Many of them have an arch in; some of them have not.

Q. Have the engines got this arch in?

A. Some of them.

Q. This device is for the reception of sparks and cinders?

A. Yes, sir.

Q. What is this mesh, what you call a netting?

A. Some is coarse and some finer than others. A man can hardly tell the kind they use.

Q. Can you give an idea of the spaces in the smallest and in the

largest?

A. No, sometimes even they take out fine netting and put in

coarser for the engines to steam.

Q. Can you tell us whether or not the locomotives, in going on the roads, do adopt some method of arresting sparks?

A. On a great many of the engines, and I know the improved

engines do.

JUROR: Try to.

A. Try to get the best device they can.

Q. As a practical engineer, have they succeeded in any device which is successful and perfect in arresting sparks?

A. Nothing perfect that I am aware of.

Q. Did you ever see engine 35 of the Wabash down in the yard?

A. Yes, sir.

Q. When did you see that?

A. I have seen her several times. Q. When did you last see her?

A. Last Saturday night.

Q. After dark?

734

A. Yes, sir.

Q. What was number 35 doing?

A. Switching.

Q. Dragging loads and making up trains?

A. Unloading the boat, I beli-ve, and switching around.

Q. When you saw engine 35 down there Saturday night how near were you to her?

A. I was within ten or fifteen feet, part of the time, and part of

the time thirty or forty rods.

Q. How long were you there observing her?
A. About two hours, perhaps a little more.

Q. Observed her work?

A. Yes, sir.

Q. You saw, did you not, that she was so fitted that she did not throw sparks?

A. I know that she was fitted for that; as I understood, but she threw sparks just the same.

Q. Give the jury some idea of the extent.

A. She did not throw sparks quite as bad as some of the other engines did that were working around there, coming in and going

out. I think if they had put her down in the corner and opened her up a little bit she would have thrown sparks more.

Q. Give the jury an idea of how she did throw sparks.

A. I don't know that I can give an idea. She threw sparks enough to set fire, if it happened to strike anything inflammable.

Q. How far from the top of the smokestack did the sparks proceed?

A. From 30 to 50 feet, as near as I could judge by the eye.

Q. Did they go up and off?

735 A. They would go up and sail off. They were not running fast enough to go back very far.

Q. Do you think she threw sparks enough to light?

A. I think she would set fire if she had been working very hard if there was anything inflammable around there.

Q. Did she throw sparks half as bad, or quarter as bad as the

other engines?

A. No, I don't think she threw them quite half as bad, but she threw more than a quarter probably.

Q. Did they work her hard at the time?
A. No, they were not working her hard.

Q. Did you notice whether she had on at the time the steam jet to pour upon the sparks?

A. You could hear it perhaps twenty cars off.

Q. She had every apparatus working, including the steam jet?

A. I presume they did.
Q. You could hear it roar?

A. Yes, sir.

Q. In drawing a loaded train in the practical business of engineering, going up a grade, say 25 feet to the mile, do you think they can run that grade and drag a load with the dampers closed?

A. No, sir, I don't think they can; if the grade is very far, I don't

think they would try to do it. I know I should not.

Q. The engineers would not think of it?

A. No, sir.

Q. What do you say as to whether it could be done with a load?

A. It might be done, but they would not have much steam, or dampers either.

736 Q. Suppose it was 521 feet to the mile?

A. They would want more dampers than they had in the ash-pan.

Q. Do you think they could drag a train up a grade 52½ feet to the mile without opening the dampers?

A. No, sir.

Q. Suppose the grade is $52\frac{1}{2}$ feet to the mile up to this place and the locomotive runs on a less grade, would the same rule apply as to keeping the dampers open if the train were being dragged up that $52\frac{1}{2}$ -feet grade, even if the locomotive had passed it?

A. They would keep one damper open anyhow. Q. A train of say five or ten passenger cars?

A. It would be according to the size of the engine. If they had a very heavy engine, five or six cars would not be much of a train,

but I think they would keep the dampers up. I do not think a practical engineer would drop his dampers, because the exhaust would bend the dampers so that he could not close them when he wanted to.

Q. In your experience in railroading, have you known of any device in carrying on the business, have you ever seen a locomotive drawing a load or working in a yard that did not throw sparks sufficiently and fire?

cient to set fire?

A. I have not.

Q. In all your experience? A. In all my experience.

Q. About how high would sparks go from an engine upon a running train generally?

A. According to how fast they are running and how hard they

are working, taking everything into consideration.

Q. Running about ten miles an hour?

A. If they have got a heavy train behind them they would throw considerable cinders, but with a light train they will not throw so much. In the working of the engine, and on a grade it is quite different than if they are on a level. On a level they do not have to work it so hard, and it will not throw so many cinders. On a grade where they put an engine down, it will throw a good many cinders.

(). As to the practical use of this netting that is used as a spark-

arrester, does it burn out occasionally?

A. Yes, sir.

Q. Gets out of repair?

A. Yes, sir.

Q. Is there any examination made as to that?

A. There is a man who is supposed to examine it every time the engine goes in, once a week.

Q. Is that done practically in railroading, or is it changed when there is a hole in it?

A. Not always.

Q. I suppose the heat is pretty strong on this netting?

A. Nearly as hot as it is in the fire-box. Q. And it destroys the wire very soon?

A. Yes, sometimes it does and sometimes it lasts quite a long while.

Q. Do you know the F. & P. M. locomotives?

A. I have seen them.

Q. Do you know of this device upon them?

A. I have been aboard them, and I have seen quite a few of the front ends. I was up to Saginaw a year ago this August coming, and I saw several of the front ends then.

Q. Who was with you at the time you witnessed number 35 at

work?

738

A. Mr. Backus.

Q. Last Saturday night?

A. Last Saturday night.

Q. Do you find in the practical use of the spark-arresters that the finer mesh has any effect upon the making of steam?

A. The finer the mesh the less steam, the less draft.

Q. I don't suppose that any notice was given at the time you saw this Saturday night; there was no notice of its being on exhibition?

A. Not that I know of.

Q. You merely found out number 35 and noticed it working? A. That and other engines.

Q. You were there to see its ordinary working in ordinary business?

A. Yes, sir.

Q. And it was working at ordinary yard business?

A. Yes, sir.

Cross-examination by Mr. BAKER:

Q. How long since you were an engineer?

A. Last January.

Q. What road were you working on?

A. Houston & Texas Central.

Q. When did you move up here? A. I have always lived here.

Q. Did you live here when you were running a railroad in Texas?

A. Yes, sir.

Q. Your home was here?

A. Yes, sir.

Q. Did you ever work on the Michigan Central? 739 A. Yes, sir.

Q. How long ago?

A. In 1882.

Q. You have been working down in Texas since 1882?

A. No, sir.

Q. What are you doing now? A. I am not doing anything.

Q. Where did you get acquainted with Backus?

A. I got acquainted with him down in his office, I think.

Q. When? A. I don't know—a few days ago. Q. How did you come to be there?

A. I went there on business.

Q. With whom?

A. Alone.

Q. Who called you there?
A. A friend of mine told me about a situation, and I went to see Mr. Backus about it.

Q. What did he tell you?

A. He told me he knew of a situation for me, and that Mr. Backus could tell me about it.

Q. As an engineer?

A. Stationary engineer.

Q. Did you hire out to him as a stationary engineer?

A. No, sir; he told me he did not know that I could get it at all. Q. He hired you to go and watch this engine?

A. No, he did not.

Q. How did you come to go?

A. I went of my own free will and accord.

Q. Did he ask you to go?

A. No, I don't know that he did. 740 Q. Without his asking you to go and without expecting any pay, you went down and watched that engine for two hours?

A. Yes, sir.

Q. Where did you stand?

A. In the freight-house part of the time, and above the freighthouse.

Q. Backus was with you all the time?

A. Yes, sir.

Q. What time did you comm :e?

A. About 8 o'clock.

Q. What time did you quit?

A. About 10.

Q. You staid right down there with Backus during all that time?

A. Yes, sir.
Q. You mean the old gentleman?

A. Yes, sir.

Q. Did you go in the depot? A. No.

Q. Did you have any refreshments during those two hours? A. No, sir. Q. You were intently watching the engine for two hours with Mr.

Backus? A. Yes, sir.

- Q. He didn't ask you to go?
- A. No, I didn't ask him to go. Q. You just went. How did you know there was going to be an engine down there at all?

A. I know there are engines there always.

Q. You went down there so see one because one had always 741 been there?

A. I went down to see one because I had heard of this wonderful spark-arrester on number 35.

Q. Who told you about it?

A. Mr. Backus.

Q. He did not ask you to go down and look at it?

A. No, sir.

Q. Has he hired you as stationary engineer?

A. No.

Q. You expect him to shortly?

A. No, sir; not from what he told me Saturday.

Q. You are still an applicant for the place?

A. No, sir; I don't know as I am. I expect to be employed in another place altogether.

Q. Whereabouts? A. Out at the Detroit electrical works.

Q. Stationary engine?

A. Yes, sir.

Q. Were you discharged from this Texas road?

A. No, sir.

Q. Resigned? A. Yes, sir.

Q. You are hunting for a job?

A. Yes, sir.

Q. You watched that engine do her ordinary work for two hours?

A. Yes, sir.

Q. You were not dicharged from the Michigan Central? A. No, sir.

Q. You resigned there?

A. Yes, sir.

742 Q. And went down to Texas?

A. Not right away.

Q. You say you looked at that engine and saw her operate for two hours last Saturday night?

A. Yes, sir.

Q. She was doing her ordinary yard-work?

A. I presume so.

Q. You know what yard-work is?

A. I don't know that she was doing her ordinary work. She was working back and forth there.

Q. Constantly for that two hours?

A. Not all the time? Q. Most of the time?

A. Most of the time.

Q. There were other engines working right alongside or in the same yard?

A. In the same yard; yes, sir.

Q. And it is your judgment as an engineer that the amount of sparks that she emitted had been reduced three-fourths?

A. Yes, sir; about that, I should judge.

Q. Had been reduced at least three-fourths? A. Yes, sir. She was working about the same as the other engines were.

Q. By sparks you mean something that comes out of the engine that you can see in the night?

A. Yes, sir.

- Q. The sparks that came out of her were very small, were they not?
- A. I didn't see any of them to pick up. They looked about as large as any of the rest of them.

Q. That is, A. Yes, sir. That is, you could see them in the air there?

Q. There was about one-quarter as many as out of the other engines.

A. Yes, sir.

Q. Most of those sparks would go out a very short distance from

the engine?

A. No, sir, not a very short distance. Some of them went as far as fifty feet, I should judge. Sometimes they would go out, and sometimes they would strike the ground before they would go out.

Q. Did you see any of them strike a freight car?

A. They were not near a freight car.

Q. Did you see any of them strike a building or anything of that kind?

A. No, sir, they all struck the ground.

Q. Were they not handling freight cars about there?

A. From the freight-house to the boat; there was quite a space between the two tracks.

Q. Were there not any freight cars there?

A. Not that side.

Q. But right back of the engine, right in the draught of the engine?

A. The freight cars were all ahead of the engine.

Q. But the wind-

A. It was so that it took them off quartering the other way.

Q. Did that engine set fire to anything that night; to a car, or anything?

A. No, sir.

744

Q. Do you believe that that engine would have set afire to a building or anything that night that would have been right along-side?

A. That is impossible for me to answer.

Q. You have operated a locomotive a good many years?

A. Yes, sir, quite a number.

Q. Have they any new appliances down in Texas?

A. Yes, sir.

Q. Have they this extension front?

A. Yes, sir.

Q. The extension front that you know of has a spark-arrester that comes just below the nozzle, just below the exhaust?

A. It has a netting there.

Q. A spark-arrester, is it not?

A. Yes, sir, I suppose you would call it that.

Q. Have they a paffling plate that runs in front of the flues?

A. Yes, sir. That is made of iron.

Q. So that the cinders strike against that when they first come out of the flues?

A. Yes, sir.

Q. And then they go through this netting?

A. Yes, sir.

- Q. They go through that by the exhaust?
- A. Yes, sir.
 Q. Do the engines you have operated have a brick arch on them?

745

A. Some of them have, and some have not. Sometimes they have to run them awhile with the arch burnt out before you can get a new one put in.

Q. But it is usual, if they are kept in the right way, to have a

brick arch, substantially as that represented there (diagram).

A. Yes, sir, except when they are worn out. Q. It helps to reduce the sparks and smoke? A. I don't know that it does; I never saw it so.

Q. What do they have them for?

A. Making steam.

Q. What makes the steam? A. Fire.

Q. Does it consume more of the coal and smoke, in making that fire?

A. Yes, sir.

Q. That must reduce the smoke?

A. Yes, sir.

Q. It does reduce the smoke?

A. Yes, sir. Q. You have no doubt about that?

A. No, sir, not a bit.

Q. Have you ever had an engine that had this steam attachment on it that goes into the smokestack, and also a discharge in the firebox?

A. No, sir; I have seen them, but never run one of them.

Q. You take an engine that has an extension front, with a netting or spark-arrester in it in good condition, a brick arch in it in good condition, and everything in good order, it produces very great reduction in the amount of smoke and cinders, does it not, compared with the old-fashioned?

A. Yes, sir, compared with the old-fashioned, providing the front of the engine is not stopped up. In running 30 or 40 miles your

front end gets stopped up.

Q. You have places along the road where you let them out? A. Sometimes you do and sometimes you don't. There are some places you cannot let them out.

746 Q. You would not do it in a dangerous place, of course. You let them out of a trap at the bottom of the front?

A. Yes, sir.

Q. You exercise all the care you can in letting them out, I suppose?

A. Yes, sir.

Q. So as to avoid danger as much as possible?

Q. Down in that Texas country, did you run in a saw-mill country?

A. No, sir.

Q. Did you run out on the prairie?

A. Yes, sir, rolling prairie.

Q. You didn't run into any lumber country?

A. No, sir.

Q. So that you have no doubt an extension front and a brick-arch engine is a very great improvement over the old-fashioned one?

A. My engine that I run in Texas used to run with as many

cinders.

Q. It was not very much of an engine, was it?
A. Yes, sir, I thought it was a very good engine.
Q. But as far as arresting sparks was concerned?
A. It was about as good-built an engine as this one.

Q. Did it have a spark-arrester on it?

A. Yes, sir.

Q. And a brick arch?

A. Yes, sir.

Q. I suppose you could run that engine so that it could throw sparks like the old Harry?

A. Yes, sir.

Q. And you frequently did do it?
A. No, sir, not any more than I had to.

Q. If you have a good supply of steam on, you can run quite a little ways without opening the dampers?

A. No, sir, I would not run as far as from here to that door with

my dampers shut.

Q. That is, you could not run an engine from here to that door with the dampers shut?

A. You can run an engine just as far as you have a mind to with your dampers shut, if you want to; but you don't want to.

Q. Suppose you wanted to, how far could you run it with the dampers closed?

A. I don't know; I would not want to run it very far.

Q. But suppose a case where you wanted to; suppose you were to take an engine with directions to see how far you could run it with the dampers shu, how far do think you could run?

A. I could not tell; I never tried it.

Q. So that you don't know what can be done in that respect?

A. I know after you run it a very little ways you would not have any dampers on your pan.

Q. But you have never tried it to see how far you could run?

A. Yes, sir, I have with one damper closed.

Q. But not with both closed?

A. No, sir.

you run 20 rods?

Q. You let her slide with the dampers right open?

A. Not that exactly.

Q. But you never made a test on any road you have ever run on, to see how far you could run with the dampers closed?

A. I don't see how any practical engineer would do that.

Q. Suppose you were just going into the round-house at the end of your journey, how far do you think you could go, say how far out could you go without opening the dampers at all; could

A. Yes, sir; I guess so, because you would not have to use much steam, that is, with a light engine.

Q. Pulling an ordinary passenger train, say five or six or eight coaches, how far could you go?

A. Not very far.

Q. Could you go 30 rods?

A. No, sir; I would not want to go that far.

Q. But could you?
A. I could not tell.

Q. You cannot tell because you have never tried—because you don't know anything about it.

A. No, sir.

Q. You never had directions to run half a mile or so?A. No, sir; nor one foot with both dampers closed.

Q. So you never did it?

A. No, sir.

Q. Can you get any draft with the door of the fire-box open?

A. Very little.

Q. You can get a little?

A. Yes, sir, a little cold air in the flues.

Q. Down there in Texas, I suppose when you are out on the prairie you just pull the dampers open and draw a train just as fast as you can?

A. Well, yes.

Q. Do you have depots down there?

A. Yes, sir.

749 Q. How many did you ever set afire with your engine?

A. I don't know as I ever set any afire. I set a water tank on fire at one time.

A JUROR: Did you ever set the prairie on fire?

A. Yes, sir; frequently we set the prairie on fire, almost every trip, but they plowed it so as to keep it from spreading.

Mr. Baker: That is out in the country where you are running at

full tilt?

A. Yes, sir.

Q. With the dampers wide open and the engine working to its fullest capacity?

A. No, sir.

Q. Nearly to its fullest capacity?

A. No, sir; not nearly.

Q. How many miles an hour?

A. Eighteen to twenty.

Q. How many lumber yards did you ever set fire to down there?

A. Never ran past any lumber yards.

Q. The only building you ever set afire was a water tank?

A. That I know of; yes, sir.

Q. But you occasionally set the grass afire in the dry time?

A. Almost every trip.

Q. But that would be in the time of drought, when the grass would be dry?

A. Yes, sir; the grass would be dry, or it would not burn.

JUROR: Did you ever go aboard the engine you saw down there?

A. I never was on her.

750 Q. Have you ever seen it used on other railroads?

A. No, sir.

Q. Do you know with the new appliances they have got no dampers—that it must be air-tight?

A. No, sir; I never examined the engine at all.

Mr. BAKER: You didn't go on this engine?

A. No. sir.

Q. Don't you think, as an engineer, that a device that will reduce the amount of sparks three-quarters is a pretty good device?

A. Yes, sir; I do.

Q. It beats everything you ever saw, does it not?

A. I don't know. If they put a train to her I could tell better; I could test her better.

Q. I suppose you think you could overload her and manage it so that you could throw sparks?

A. I think I could throw sparks out of it.

Q. There is no engine in the world but you could throw sparks out of if you tried to?

A. I don't doubt it at all.

Q. On your engines you test to see how many sparks you can throw?

A. No, sir.

Q. You overload an engine occasionally?

A. I don't do it. The superintendent does that. Q. But in firing, your fireman overloads her?

A. No. sir: I don't allow that.

Q. So that you don't have any difficulty from that?

A. No, sir.

Q. So that, as far as your judgment goes, that is the best spark-arrester and smoke-consumer you ever saw?

A. I have not seen it in practical use.

Q. You saw it there operating when the engine came, frequently taking out something?

A. They didn't give it a fair test. Q. You went there with Backus?

A. They didn't give it a fair test.

Q. It was doing its ordinary work in the yard?

A. I didn't see them with a long train on.

Q. Did you go and ask them to give it a harder test?

A. No, sir.

Q. You just saw them doing work in the yard?

A. That is all.

Q. And although you went there with Backus, and you come here as a witness in his behalf, you are compelled to tell this jury that it reduces the sparks three-quarters?

A. I am compelled to tell the truth so far as I know.

Q. And the truth compels you to tell that?

A. Yes, sir.

Redirect examination by Mr. Dickinson:

Q. You say it is not a fair test. I suppose what you would consider a fair test would be for the use of such a locomotive, would be a locomotive dragging a train, a load?

A. Yes, sir.

Q. You didn't see, in this observation of yours of engine No. 35you didn't see it drawing a load, or pushing a load, but only a car?

A. They had four or five cars, the most they handled, and some

of the cars were loaded and some not. Q. For a short distance?

A. Yes, sir; going very slow. Q. What would you consider a fair test?

A. If they had twenty or thirty cars behind, in going up that

grade, that would be a pretty fair test.

752 Q. Going up a grade, you have been asked about opening dampers; you have been asked if opening the door of the fire-box does not give you a draft. I suppose the draft, whether it comes from the open dampers or the fire-box, is what enlivens the fire and what makes sparks, is it not?

A. No, sir; the opening of the dampers gives a draft.

Q. A direct draft?

A. A direct draft. If you open the doors it deadens your fire, it cools your engine off.

Q. Opening the door gives you no draft?

A. Only cold air on your flues.

Q. What is the purpose of opening the door?

A. To cool the engine off. Q. It is not to give a draft?

A. No, sir; you take a draft, and it goes right over the top of your fire.

Q. In going up a grade, will opening your door, instead of opening your dampers, help you up the grade?

A. No, sir; it is worse, your steam goes back on you.

Q. The very object of opening the door is to stop the life of your engine?

A. Yes, sir.

Q. In going up a grade with a heavy load, opening the door would make it still worse?

A. Yes, sir.

Q. Do you think that a load of five or six or eight cars, as given you by Mr. Baker as his test, could go up a grade of 52 feet to the mile-could a locomotive drag a train up such a grade or go across a level dragging a train up that distance, with both dampers closed?

A. No, sir, I don't think it could be done; I don't think that

anybody would undertake to try it.

Recross-examination by Mr. BAKER:

Q. You never tried to do any such thing, did you?

A. Not with a train behind me.

Q. So that you don't really know whether it can be done?

A. I say I don't think it could be done.

Q. You never tried to do anything of that kind?

A. I think a man would get jacked up, as we call it, if he tried

it; it would break up things.

Q. Is it not true that you can, by opening the door to the firebox slightly, half an inch, or an inch, increase to a slight extent the combustion?

A. No, sir.

Q. You cannot get any assistance from it at all?

A. No, sir, the steam will go right back.

Q. You are quite sure that if you open the door to the fire-box a trifle, it had a bad effect instead of a good effect?

A. It has a bad effect; yes, sir.

JUROR: When the flues get choked up by soot, what effect has that upon the cinders; where do the cinders go then; you have got to clean the flues?

A. They clean the flues for you in the shops.

Q. But you start from a point to your destination without cleaning your flues, sometimes?

A. Oh, yes.

Q. Don't you find the engine will get choked up?

A. Yes, sir.

Q. What effect will that have on the cinders; they have got to go through the smokestack?

A. That leaves you one less flue to get a draft through; that is

all.

754 Q. So that you have to turn out more draft, get more steam and more power?

A. Your engine would not steam so good with less flues as with all of them.

Another Juron: If you are a stationary engineer, as well as a locomotive engineer, you must have noticed that all stationary boilers and furnaces have air-holes above the fire, and they are very useful and very necessary to open them, sometimes.

A. Yes, sir.

Q. Does not the opening of the fire-box door answer the same purpose as on a common furnace?

A. No, sir.

Q. That does not give the oxygen right into the smoke, into the air, and consume it?

A. Yes, sir; but you understand that the exhaust in a locomotive comes through your fire.

Q. When you have your fire-box open?

A. Yes, sir, it does all the time; if you have your door open, that pulls cold air through there and cold air through here (diagram), and this cold air strikes the flues without striking the fire, and cools your engine off.

Q. When the fire box is cold below, you have no fresh air admitted to the fire, you open the door a little, and it lets in a little

air?

A. There is space enough here to get your air through, when you

have your dampers closed, and you open your engine up, and the dampers go like that (clapping his hands) with every exhaust the engine makes, so that there is more or less air comes through the dampers anyhow, if your door is shut; if your door is open that

cuts the draft off.

Q. You cannot get the same effect on a locomotive as you 755 can on a stationary or furnace?

A. No, sir.

Q. With the air above the fire?

A. No. sir.

Mr. BAKER: Why?

A. Because the draft in a stationary is in a large chimney.

Q. Here you produce a draft with the exhaust? A. Yes, sir.

Q. But it is a draft just the same?

A. Yes, sir.

Q. Now, if you close a fire-box on an engine, the dampers and the door are closed, so that it is all tight there, how are you going to get oxygen with which to carry on combustion; I am talking about the old combination; where are you going to get your oxygen that you keep your exhaust working here with?

A. With your dampers closed; that is what I have been trying

to tell you.

Q. The juryman asked you if you could not get a little oxygen if you slightly opened the door here, so that you could consume part of the smoke under such circumstances?

A. It deadens your fire right away.

Q. But could you not get a little oxygen so that you would increase the fire actually?

A. No, sir.

Q. Which would produce the greater heat, to have it all tight there, with no draft at all, or a slight draft to aid in the combustion?

A. I don't know.

756 Q. But if you had it closed up tight, if you had your dampers closed and the fire-box closed, so that the whole thing was tight, the fire would smoke, would it not?

A. I couldn't tell you anything about it; I never saw an engine

built that way.

Q. You have seen them built with dampers?

A. Yes, sir.

Q. You have seen them built with doors?

A. Yes, sir.

Q. And you have seen them closed?

A. Yes, sir; closed when they stand still, of course.

Q. Suppose you had a good fire in there and closed them all up, standing still, how long could you stay that way?

A. It would not be perfectly tight then with the dampers closed. Q. If you had the dampers closed, and everything was practically tight, as tight as any ordinary construction would make it, don't

you know that you could increase the combustion, the consumption

of smoke in that engine, by having the door to the fire-box slightly opened, or having the dampers so that you could let in a little air?

A. You could with the engine standing still not exhausting.

Q. But suppose she was exhausting so as to make a vacuum there, that would increase the draft, would it not?

A. That would draw your draft right through the flues.

Q. But if that oxygen you let in there aided in the consumption of the smoke, it would make heat?

A. No, sir.

Q. Burning smoke makes heat, does it not?

A. It does not burn the smoke.

Q. There is such a thing as burning smoke?

A. I have heard them say so.

Q. Have you seen it?

A. No, sir.

757

Q. You have seen an ordinary kerosene lamp work?

A. Yes, sir.

Q. That burns smoke when it is first lighted?

A. I could not say that it burns smoke.

Q. Don't you know that an ordinary kerosene lamp, when it is turned up to a proper height and the lamp is in good order, consumes smoke?

A. I don't know that it does.

Q. And don't you know that it does it, because there are holes through the bottom of the chimney, by which air comes in above and at the side of the flame?

A. Yes, sir, but I didn't know that it burned the smoke.

Q. There is not any smoke when the lamp is properly adjusted?

A. No, sir.

Q. Don't you know that if you closed up those little openings at the base that let in the air, the fire would smother?

A. Yes, sir.

Q. Don't you suppose it would operate just the same in a locomotive?

A. No, sir, I don't.

Q. Don't you know if you closed the dampers and the doors, and had it all tight there, sooner or later your fire would go out?

A. No, sir, I don't know as it would; when the coal is all burned

up it would.

Q. Don't you know that they put this brick arch in there so as to bring the flame back and keep it in the fire-box as long as they can, for the purpose of consuming as much as possible of it?

A. Yes, sir.

Q. And it operates, to some extent—not entirely, but to some extent—just as a lamp chimney does?

A. I don't know that it does.

Redirect examination by Mr. Dickinson:

Q. Here is the principle of the kerosene lamp: It is the chimuey principle, not particularly because it is kerosene, but because it is 56-55

the chimney principle, that is all there is of it, not because it is a kerosene lamp; now, I don't suppose you are learned in all the laws of oxygen and hydrogen, but don't you know that the oxy. gen—you know what oxygen is?
A. Yes, sir.

Q. And you know it is lighter and rises?

A. Yes, sir.

Q. It is the lightest of gas?

A. Yes, sir.

Q. Now, in this lamp, the oxygen enters through this draft from the bottom, does it not?

 A. Yes, sir.
 Q. Now, suppose, instead of that this should be closed below here, all closed up, so that no air or oxygen could get up, and you should put the opening in there, do you think the lamp would smoke?

A. Yes, sir.

Q. If you put your oxygen in above, it would smoke?

A. Yes, sir.

Q. And the object of this chimney, the principle of the chimney is, that it makes a draft to draw the oxygen into the flame, is not that it?

759 A. Yes, sir.

Q. Did you ever know of any oxygen—no one but Brother Baker did-that would fall, expecially when there is an exhaust pumping through your fire, to not only add to the volubility of your oxygen, but an actual pump to pump it out?

A. No, sir.

Q. Take a base-burning stove; you let in the air to your baseburning stove through the bottom, under the fire?

A. Yes, sir.

Q. If you close your dampers on your base-burning stove and open the door, what becomes of your fire?

A. It cools off.

Q. But in a locomotive there is a constant exhaust as you run?

A. Yes, sir.

Q. Pumping it out?

A. Pumping it out all the time.

Mr. BAKER: Do you think this chimney of the lamp would work if you closed up the holes underneath there?

A. No, sir.

Q. There is no doubt about it?

A. I don't think so.

Q. So that the air that comes in alongside of the blaze there does increase the combustion?

A. Yes, sir.

Q. So that if you took the chimney off, so there was no draft, you would have a smoking light?

A. Yes, sir.

Q. And it would smoke all the time that it burned, but by putting the chimney on, the principle of the lamp is that after it becomes heated it creates a draft through there?

760 A. Yes, sir.

Q. And by drawing the air through, going there with the flame, it enables the smoke to be consumed?

A. Yes, sir, it all comes in here (pointing to the lamp).

Q. Certainly, but it goes up there through the side of the flame? No answer.

Mr. Dickinson: Is it true that the fireman as soon as he builds his fire and puts in his coal is in a hurry to get his doors closed?

A. Yes, sir, he always swings his doors; when he has a heavy train, he puts in a shovelful and swings the door; they don't wait until they go back for another shovelful.

Q. If you open the doors and you are running, have you ever

observed how much the steam will come down per second?

A. I never took any note of that.

Mr. BAKER: Do you adhere to your testimony that when the dampers to an engine are closed so that the draft through the coal is shut off, you cannot increase the combustion of the smoke, the burning of the smoke, by having a slight opening through the door either by having a small damper or leaving it slightly open?

A. I said you might increase the combustion of the smoke, but

not of the steam.

Q. So that you don't agree with our men, that you could increase the combustion of the smoke?

A. It is steam we are after.

Q. But you could increase the combustion of the smoke?

A. Yes, sir, but it is the steam we are after.

Mr. Baker: I would like to ask whether the jury intend to go to see the engine tonight. It was understood last week — were to go down to look at the engine tonight. I would like to know what time you desire to be there.

Mr. LESHER: I could not possibly go tonight. I could go tomor-

row night.

Mr. Baker: Can the rest of the jurymen go tomorrow night? Several jurors answer that they can.

A Juron: I guess that is all satisfactory, tomorrow night.

Judge CHIPMAN: I wish to say to this jury that any test of that engine to be fair, should be one that the parties do not know you are making; you should go down there without any preparation or any knowledge by the parties, just catch if on the wing, so to speak.

Mr. Baker: We have had the testimony of one witness who has seen it operate in its ordinary manner, but it is perfectly practical for the jury to go down there, and they can tell the engineer what

they want to have done.

Judge Chipman: My proposition is this: I do not want them to

fix that engine up for the occasion.

Mr. BAKER: It will not be fixed up for the occasion. There is no way of fixing it up.

Judge Chipman: I don't know whether they will or won't.

Mr. BAKER: You seem to be afraid of it.

Judge Chipman: I am afraid. I think it is the duty of this jury to protect our rights to that extent. They say this engine is in use every night and day. Now, the jury should go there some night and look at it to satisfy themselves.

A JUROR: I want the engine to run further than in the yard;

that is no test.

762 Mr. Baker: We want you to test it in every way.

Judge Chipman: You can test it just as well when they don't know the time you are coming as when they do.

Mr. Baker: We are willing to have it run forty or fifty miles, and any engineer on this jury can direct how it shall be run.

Judge Chipman: The fair way to do is to take that engine and say, Here, we want to look at it, without giving notice of the time. If you give a notice of 24 or 48 hours ahead, that would not be fair.

Mr. Baker: All we want notice for is to keep our men there. You can take another engineer and do all you have a mind to with it, all night long, and the idea that it can be fixed is perfectly absurd. They are switching with it, but you can have it run out with a train of cars. There was a witness here this afternoon who complained that a fair test was not applied, and we want you to apply every test you may see fit to put to it.

Judge Chipman: I don't want them to put in a brand-new netting. A Juron: The only way is to go a long distance enough so that

netting will get dirty, and so that we can make a good test.

Judge Chipman: There are a great many ways in which this engine can be prepared for this test, and you cannot be detected.

Mr. Baker: It cannot be prepared, and it won't be prepared.

A JUROR: It has been suggested by a juryman that if the same engine would go around Saginaw and around those lumber piles and yards there, it would be a good thing.

Mr. Baker: Certainly, we will take you up there. We cannot do that tomorrow night, but some time during the week we will go up there and be very glad to do it.

GEORGE L. D. SUTHERLAND, sworn in behalf of respondents.

Examined by Mr. Dickinson:

Q. What is your business?

A. I have charge of the cleaning and repairing in the car department.

Q. You are foreman of the car department of the Michigan Central?

A. Yes, sir.

Q. How long have you been foreman of the car department of the Michigan Central?

A. About thirty years.

Q. As foreman, or superintendent, of that department, what is your business at the depot, what are your duties?

A. To see that the trucks and cars are kept in good condition and cleaned.

Q. Does this include the passenger cars?

A. Yes, sir.

Q. Does that duty cover the Flint & Pere Marquette cars that come in there?

A. Yes, sir.

Q. Now, we will take the passenger cars of the Flint & Pere Marquette that come into that station, the Michigan Central station, in your department, and come under your observation. Will you please tell the jury about these passenger cars of the Flint & Pere Marquette, what the condition is of those cars as to einders when they come in?

A. They have a considerable amount of cinders, but not so much,

ordinarily, as the other trains.

Q. About what amount of cinders per car will come off

the Flint & Pere Marquette cars?

A. There would be in the neighborhood of a pint or a pint and and a half.

Q. A pint in a car?

A. Yes, sir.

764

Q. What does that come off of?

A. Off the floor and off the seats and the ventilators.

Q. But in the neighborhood of a pint each comes off the Flint & Pere Marquette cars that come in on the Michigan Central road?

A. Yes, sir.

Q. Do you observe the cinders upon the Detroit, Lansing & Northern cars—I think they do not come within your jurisdiction, but have you observed them?

A. I have seen them there, but I don't clean or examine those

trains?

Q. But from what you have seen of them, have you seen how they compare in the matter of dirt and cinders with the other cars?

A. I don't think they are quite so bad.

Q. Are they as bad as the Flint & Pere Marquette?

A. About the same.

Q. The Flint & Pere Marquette and the Detroit, Lausing & Northern are not so bad as the other cars?

A. No, sir.

Q. What is the average of cinders taken off the other cars that come into the Michigan Central?

A. We would run about a pint and a half straight on the other cars.

Q. And you get about a pint off the Flint & Pere Marquette?

765

A. Yes, sir; a pint to a pint and a half.

Q. How far do the Michigan Central cars that you refer to as getting a pint and a half straight come?

A. They come through from Chicago.

Q. Do you know anything about their having similar devices for burning smoke and cinders on the Grand River Valley division of

your road as upon the Detroit, Lansing & Northern, and the Flint & Pere Marquette?

A. They have a few engines there.

- Q. They are fitted with the same devices as the Detroit, Lansing & Northern and the Flint & Pere Marquette?
 - A. About the same, I don't know exactly. Q. You are not an expert in mechanics?

A. No, sir.

Q. How do you find the cinders on the cars of the Grand River Valley?

A. The Grand Rapids express brings in about the same amount

as they do on the main line.

Q. How far do the Flint & Pere Marquette cars come?
A. They come through from Bay City and Saginaw.

Q. From the interior of the State?

A. Yes, sir.

Q. Not from Chicago; they have no through line outside of the State?

A. No, sir.

Q. Give us some idea of the kind of cinders and the size of them, the average cinder that comes off?

A. They are about three times the size of the head of a pin.

Q. That is the general run of them?

A. Yes, sir.

Q. Will you state whether that is the average size of them; do some of them run larger and some smaller, some even like dust?

A. Yes, sir.

Foreman Lesher: Are there a great many cinders that blow off, that do not catch at all?

A. Yes, sir, there must be, with the motion they will blow off; we only get what is brought in the cars.

Q. And about as many blow off as catch on?

A. I should judge so.

Q. Would there be more than that?

A. Probably there would be.

Mr. Dickinson: These cars on which you find the cinders on the Central road, do you find them in the Pullman cars, in the parlor cars?

A. All the Pullman cars we have on the Central road merely run between here and Cincinnati. We have no Pullman cars that run between here and Chicago.

Q. You have the Wagner?

A. Yes, sir.

Q. Do you find cinders on the Wagner cars?

A. Yes, sir.

Q. About the same as in the other passenger cars?

A. Yes, sir.

Q. And those are especially constructed to keep out cinders, double windows, etc.?

A. Yes, sir.

Q. Do you find these cinders in the winter as well as in the summer?

A. Yes, sir.

767

Counsel shows witness a box of cinders.

Q. Will you look at that and see if it is a fair average sample of the kind of stuff that comes off?

A. Yes, sir, I should say that was a fair sample.

Mr. Dickinson: Gentlemen of the jury, this came, as we shall show, from No. 42 passenger car of the Detroit, Lansing & Northern railroad, due here on 11.15 a.m. train, taken off on June 19, 1891; it all came from one car. We shall prove that afterwards.

JUROR: Have you any idea what coal that came from?

A. Soft coal.

Mr. Dickinson: How about the cinders on the platforms of the cars; do you include those in your statement of a pint to a pint and a half?

A. Yes, sir.

Q. The same general kind of cinders?

A. Yes, sir.

Q. I suppose the other cinders come in through the ventilators?

A. Yes, sir, the fine ones.

Q. And through the doors, and so on?

A. Yes, sir; we have a double screen, and they even work through that.

Q. You have been engaged in this business, I think, for upwards of forty years, in the car business?

A. Yes, sir.

Q. Cars coming in and going out, and locomotives and all that?

A. Yes, sir.

Q. Now, from your observation, where do these cinders come from?

A. From the smokestack of the engine.

Q. And fall upon the cars?

A. Yes, sir.

Q. I suppose you know something of devices being put upon trains or engines to stop cinders?

A. Yes, sir.

Q. Do you ever go upon the engine and ride about?
A. In the yard I do sometimes; not a great deal.

Q. All of your own engines have spark-arresters and things of that sort?

A. Not all of them; quite a few have them.

Q. Do you know anything about the general belief as to the spark-arresters arresting the drafts, among the engineers?

A. I have never paid much attention to it. It is out of my line. Q. Have you observed in the running of trains whether or not, as the locomotive may or may not be heavily loaded, it pours out more or less cinders?

A. The heavier the load the more cinders it will throw.

Q. Suppose the train, in your experience of railroading, is ascending a grade, what is the effect upon its flow of cinders from the locomotive?

A. If she is working harder of course she throws more cinders.

Q. She throws more cinders the harder she works?

A. Yes, sir.

- Q. In your observation of the cars coming in and out there, day and night, have you observed whether the cinders thrown are alive—throw fire?
- A. We generally can tell that at night better than in daytime.
 Q. I say, did you ever see a locomotive that did not throw fire when she was working?

A. I never saw one.

769 Q. In your whole experience?

A. No, sir.

Q. How far do they go from the smokestack before they deaden and become dark?

A. Fifteen to 20 or 25 feet.

Q. Occasionally some go farther?

A. It is a good deal how they are at the time.

Q. Do you know about the burning the other day of the Detroit, Lansing & Northern freight shed?

A. Yes, sir.

Q. Do you know what set it?

A. I know what I think set it. That is about two months ago you have reference to?

Q. Yes.

A. We had a lot of rubbish piled at the end of the freight-house; Mr. Ryan gave notice to remove it, but it was not removed; the next day following the Detroit, Lansing & Northern engine No. 26, with one of the smoke-arresters on, stood alongside of it there, and she touched it off and burnt the end of the building.

Q. Now, the Detroit, Lansing & Northern engine, with the wonderful smoke-arrester on it, how far did that stand from the

rubbish pile?

A. About twelve feet.

Q. Don't you think it possible that rubbish pile might have been set afire by the dumping of the damper below the receptacle there?

A. No, sir.

Q. It was not near enough for that?

A. No, sir.

Q. The rubbish pile was twelve feet from the track?

A. Yes, sir.

770 Q. It burnt up the building, did it?

A. We held it with what we had there until the fire department came; it burnt the end of the building.

Q. Why do you say it was engine No. 26?

A. She stood there at the time, at the time the fire broke out.

THE FORT STREET UNION DEPOT CO.

Cross-examination by Mr. BAKER:

Q. You are connected with the Michigan Central?

A. Yes, sir.

Q. How long have you been there?

A. Forty-two years.

Q. Do you have charge of the yard here?

A. Yes, sir.

Q. There was a pile of rubbish there where this fire occurred?

A. Yes, sir.

O. How close to the track?

A. About 12 feet from the track.

Q. What did it consist of?

A. They have rubbish heaps gather up in the yard.

Q. Was that rubbish wet?

A. It had stood in storms, but it had dried up.

Q. What did it consist of?

A. Shavings and dust and papers out of the freight-house, and such things; they made that a dumping ground.

Q. It got afire about two months ago.

A. About that.

Q. All you know about the origin of the fire is that this engine was standing there?

A. It had been working right along.

Q. It had been standing there right before the fire?

 A. Yes, sir.
 Q. How long had she been standing there before the fire 771 broke out?

A. I don't know exactly, but my office is right opposite, and I saw her all morning.

Q. Any other engine there?

A. 303 came right up there after the fire broke out.

Q. But before the fire broke out?

A. I hadn't noticed any for a couple of hours.

Q. It was right there in the Michigan Central yard?

A. Yes, sir.

Mr. Dickinson: On the Detroit, Lansing & Northern ground.

Mr. Baker: They have no ground.

Mr. Dickinson: They had then, two months ago.

Mr. BAKER: Did you see the sparks go from this engine to this heap of rubbish?

A. No, sir.

Q. It is a mere inference that it started from the engine?

A. I suppose it came from there.

Q. You suppose so?

A. Yes, sir.

Q. But it was something that was very easily ignited?

A. Yes, sir.

Q. And the servants of the company were very negligent in allowing it to remain there?

57 - 55

A. They had been notified to remove it, but neglected to do so.

Q. In whose department was it?

A. Mr. Ryan's.

Q. How long had it been there?

A. About a couple of months.

Q. And kept accumulating, I suppose?

- 772 A. Yes, sir.
- Q. You would not undertake to say that all of these sparks or einders that you gather on the platform of a car were alive when they struck the car?

A. No, sir, not all of them.

Q. Most of them would go out in going the length of the first car, would they not?

A. No, sir, I have seen them pass over fourteen cars and burn at

the end, still lit.

Q. But ordinarily?

A. That would be a good deal according to the weather.

Q. But even where there is some fire in them, it is very seldom that they cause any fire where they would ignite anything; you would have some rubbish or shavings, or something of that kind?

A. They burn our platforms in our depot, and they burn the

platforms on the cars; that is an every-day occurrence.

Q. Burn them off?

A. Yes, sir, we have to take them down entirely sometimes.

Q. That is a common occurrence on the Michigan Central?

A. Yes, sir.

Q. Do you know anything about the construction of the engines on that road?

A. I have never paid a great deal of attention to them; it is outside of my line entirely.

Q. You don't know how they compare with other engines?

A. No, sir.

773

Q. Which trains have the most cinders on them, the trains that come from Chicago, or the trains that come from Saginaw and Grand Rapids?

A. The trains that come from Chicago.

Q. What is the reason of that?

A. It is a longer train.

Q. Don't the Flint & Pere Marquette have a train that comes from Ludington?

A. That has four cars on.

Q. You find more cinders on the very fast trains, don't you?

A. Well, no, not exactly that. Fast trains will get away from the cinders a good deal.

Q. But the engines on the fast trains make more cinders?

A. Not altogether; some of them will.

Q. There is a good deal of difference in your engines in regard to that?

A. Yes, sir.

Q. But I suppose these cinders get on when they are running through the country and the engine is running at full stroke?

A. Take a damp day, running a train of fourteen cars, they will go on the rear cars; take the Flint & Pere Marquette trains, and they go over, they go up and go over.

Q. On a long train the rear cars get the most cinders?

A. Yes, sir.

Q. You have trains that go through to Chicago very quickly, in a very short time?

A. Yes, sir.

Q. And that come from Chicago here?

A. Yes, sir.

Q. And those through trains are more heavily laden with cinders than any other trains?

A. The night express and the day express are very heavy trains.

We have as fast trains as that, but not so heavy.

Q. And they have a good deal of cinders? 774

A. Yes, sir.

Q. And you sweep these cinders off the platform and out of the car?

A. Yes, sir.

Q. But there are a good many more on the platforms than there are inside?

A. That is according to whether you keep the windows open or not. If you leave the windows up, they go in.

Q. Those that go in are very fine?

A. Yes, sir. Q. They set the cur afire inside?

A. Occasionally we get a cushion afire.

Q. How often does that occur?

A. Pretty often.

Q. It sets fire to a car while between here and Chicago?

A. Yes, sir. Q. You mean the cushion?

A. Yes, sir; and it sets fire a good deal to the saloons; it gets in the corners there.

Q. What does it set fire to there?

A. In the corners.

Q. It sets fire to the windows?

A. Yes, sir.

Adjourned to Tuesday, June 30, 1891, 2 p. m.

June 30, 1891—2 p. m. 775

Mr. Dickinson: Mr. Baker admits that I hold in my hand a transcript of the reporter's minutes of my argument upon the first trial of this cause. You will remember the statement of Mr. Joy that he did not hear of any proposition to cross on the margin of the Michigan Central until this trial, and that he supposed our position was that we were to run across the Michigan Central yard, through the center of it, or somewhere else.

Mr. BAKER: I object to this as immaterial and incompetent.

Mr. Dickinson: I desire to show you that no other position was

taken except that the margin was to be taken, where the aqueduct

for teams is now to run. I read from page 519 as follows:

"If the Michigan Central is so willing and can spare a space for this viaduct, it might spare out of its large holdings in the city a space for this structure along the edge of its holdings, so as to keep the railroads together and keep the street free. Is there any other reason except that which Mr. Mulliken threw out, that it would cost too much?"

Again, at page 522:

"You need all this for your depot, Michigan Central. How many trains do you have? We have 68. How many has St. Louis? 244. How many acres in St. Louis? 10. How many has the Michigan Central? 38. What do you say, will you let us have a little margin to send the union depot road in there, and to keep this railroad business all out of the street? I tell you that the time has come when, without a word against railroad enterprise, without a word which will stay any railroad from entering, the time has

776 come when Detroit should use this immense property, now reaching 117 acres, for these railroad purposes, and pay taxes like individuals, and take no more streets, and take no more of our water front. Why should you not say to the union depot company, Go and take that margin along the edge of the Michigan Central depot grounds which the Michigan Central has given you for a viaduct, and put your union depot road there. Try that and see if you can call a halt on this continued accumulation of untaxed railroad property within the city limits."

Again, at page 523:

"But my friend says there is some charter right which will interfere with us taking this margin of the Michigan Central property under the statute. There is no franchise that the legislature or the courts of the United States can grant to a corporation that cannot be taxed for the public use. That is all it is, and if the legislature pass an act conferring the right on a railroad company, in the way of land or anything else, and expressly provides that the State or the public shall never hereafter interfere with that right, or take it away, the act of the legislature protecting that from the right to take it for the public use is absolutely void."

Again, at page 526:

"Now gentlemen, this is the first suit in regard to the route which is proposed for the street and the property owners. True, they had a suit with the Michigan Central Railroad Company, who did not desire their own property should be taken, and who were willing to shut up the entire street, as far as they were concerned, as a railroad company, but the question of the route, as it affects the in-

terests of the city, above the railroad, and the interests of the property-owners, the question of the route is for the first time before you, a jury appointed by the constitution in the

case at bar."

Again at page 544.

"Now, who is to pass upon the question of whether it is in actual use? You know pretty well that this strip of land along the Mich-

igan Centrai is not in actual use, because you have been down to see it, and they are going to give it to a viaduct. Here it is provided in the statute, as suggested by the supreme court of Massachusetts, the question of actual use and of necessity for a new taking, for the possession of said railroad company, and for the said railroad company owning and not using said land 'shall be determined in addition to other questions, as provided by law in cases of condemnation of lands for the purpose aforesaid, and the same proceedings, in all respects, as near as may be, shall be had for the aforesaid purpose as now provided by law where land is acquired for such purpose from individuals.'"

Page 545:

"Do you think that 12 men are going to rob the union depot company on a condemnation proceeding for the benefit of the Michigan Central? Are they going to say to these people, Gentlemen, do not play hog here, give this margin, leave our street, leave the public its street."

Page 548:

"We have reached the first tribunal that can pass upon the question of whether there is any need to take a highway of the city and occupy it, when the Michigan Central has property there that it is willing and has given up without compensation so far, for teams, along the margin of this road. Now that has nothing to do with

the railroad crossing. A railroad crossing cannot be made by a railroad company except by an adjustment of the rail-

road company. That is a feature between the two railroads. If they had taken the causeway that now passes over the Michigan Central, and the railroad commission can order them to take this causeway, in taking the Michigan Central railroad property for railroad purposes, to pass over the property, it can take the property for a union depot."

Page 550:

"You will see that Mr. Backus' position is, if all they say is true, that this is a great thing for Backus, this structure along there is a great thing for Backus; if all they say is true there is going to be no damage. Then don't pay us any damage, but cross the street and leave us free. Says Mr. Backus, I differ from you, I think this is going to ruin my business. You bring here a witness from New York to contradict it. You have not shown by the opinion of any expert, or the opinion of any one in the business, that this won't do what Backus says it will-ruin his business. Mr. Backus says, Go over there, go over onto this railroad property and don't give me a cent; we don't want your money at all; go over this route which the law permits you to take. Leave me with the work of my life here, if I am mistaken in my belief that this is going to ruin me; it is going to destroy the work of my life and of my boys whom I have reared to this work; going to destroy the inheritance that I have built up for them; what is your objection to going across the street and not paying us a dollar; we do not want your money, we would rather have all our business than all the damages the jury

could give us; go across the street, where the law says you can go, and where the great railroad expert says it is the best route."

779 Page 562:

"But how much more does it damage the manufacturer than it does a railroad company, or a person carrying on the same kind of business. If you pass the question that these people must use the Michigan Central margin for this route, and come to the question of Backus again, we must discuss it fully, though I do not believe after the labored exposition of the matter, if you understand it, or your duty, that you will permit this road to occupy this street when it has this other route."

Without troubling you further, let me state that there was not a suggestion in the argument that they desired to go through the Michigan Central property, but whether we might have the mar-

gin.

FERDINAND Amos, sworn for respondents.

Examined by Mr. Dickinson:

Q. How long have you lived in the city?

A. 40 years.

Q. What is your business?

A. I keep a hotel at West Detroit.
Q. What is the name of the hotel?

A. It is called the Amos house.

Q. How long have you been there in business?

A. 16 years next December.

Q. How near do trains pass to your house and the main part of your building?

A. Within six or seven feet of my building.

Q. On the front?

A. Yes, sir.

Q. Do they pass on more than one side of you?

780 A. Yes, sir.

Q. How near to you do they pass on the other side?

A. About the same distance.

Q. You have been there during the past 16 years a good deal of your time?

A. Yes, sir.

Q. You are there daily?

A. Yes, sir.

Q. And nightly?

A. Yes, sir.

Q. You say trains of all kinds pass, the Detroit, Lansing & Northern, the F. & P. M., the Grand Trunk, and so on?

A. Yes, sir.

Q. Will you please state what, from your observation to date, as to the locomotives upon those trains, pulling those trains, throwing smoke and cinders?

A. I know they throw a great many cinders which make it necessary to sweep off the platform around my house, that is the plat-

form that used to be there, made it necessary to sweep off the platform three or four times a day or oftener, which makes it necessary to keep the windows closed, or they would throw their sparks on that part of the house where the trains pass now. The tracks are much closer now than they have been. They put in another track nearer to the house.

Q. What road runs over that?

A. The Michigan Central freight trains.

Q. How near do they come to the brick wall of your building?

A. That is the one that comes within 6 or 7 feet.

Q. How far were the other tracks before this was put in?

A. Within about 14 feet of the building.

Q. What is the nature of these cinders that fly out from the

locomotives; are they alive?

A. They are at times alive. They have been showered onto my platform so hot that it was necessary to jump up out of your chair and run into the house. On one occasion the sparks got into my coat pocket, and I usually carry my handkerchief in my coat pocket, and they set the handkerchief on fire in my coat pocket. I have known people to put up their collars to save their necks from being burned.

Q. You keep a hotel there, necessarily arranged, as far as pos-

sible, to be a wayside road hotel?

A. Yes, sir.

781

- Q. Have you observed that the quantity of cinders has become smaller from any of the trains that pass of the D., L. & N. and the F. & P. M.?
 - A. Within the last few years?

Q. Yes, up to now.

A. Within the last few years they have put on what they call a spark-arrester on the front end of the locomotives, and it has reduced the quantity of cinders.

Q. That has been called to your attention?

A. Of course, I was glad to see anything that came in that line to reduce the quantity.

Q. Does it stop the flow of cinders and fire?

A. No, I don't think there are as many cinders as there used to be.

Q. You still see cinders from every locomotive?

A. Yes, sir; it depends on the condition of the fire and the amount of steam used. If they pass the front of my house using steam very hard, pulling on a heavy train, of course the quantity of cinders is increased.

Q. Do they throw more or less cinders and smoke when-

ever they pass?

782

A. There are times when they go by when cinders are not noticed.

Q. Name those times?

A. That depends on the amount of steam being used and on the condition of the fire.

Q. Do you find any cessation in the volume of steam that is thrown out from the locomotives?

A. No, there appears to be as much steam as there ever was.

Q. The steam does flow out in vast volumes sometimes?

A. Yes, sir.

Q. Does that come into your house?

A. That depends on the direction of the wind.

Q. Suppose the wind is in your favor?

A. If the windows are not closed, the steam and smoke come in.

Q. To what extent?

A. To that extent that if a man were at all troubled with asthma he would choke for some time afterward.

Q. It comes in so as to be perceptibly seen in the house?

A. Yes, sir; blackens the paper and walls and carpets and bedding.

Q. Have you noticed that the cinders as they come out of the smokestack on fire, about how far they can be trusted to fly?

A. Before this additional track was put in there, as I said before, the nearest track to my house was about 14 feet from the front wall, and the sparks would fly over up against the building.

783 Q. Alive?

A. Alive, and on the platform, so that they would burn your neck if you did not look out.

Q. Would it char the platform and make little black spots?

A. Yes, sir, and burn the paint off the platform.

Q. How about any burning in the house itself during that time?

A. My house has never caught on fire yet.

Q. I mean from the cinders, and perceptible burning from the cinders?

A. No, sir; I have been fortunate that way.

Q. On this device which you have spoken of, do you think that the flow of cinders has been stopped, so that the cinders will not fly 14 feet?

A. That I could not say. I do not think that the volume of cinders is so much now with this spark-arrester as it used to be.

Q. There are still cinders of the same general character?

A. Yes, sir.

Q. And keep alive as they used to?

A. There are still cinders scattered about up against the windows of my house and on the sidewalk, so that we sweep the sidewalk oftener than we would if it were not for these cinders.

Q. How do you keep the windows on the side that the trains

run?

A. Since this new track has been put in, I do not use the rooms on the front part of my house any more than I can possibly help, and my help have got instructions to keep the windows closed as

784 the front part of my house, that is steady, I have had wire screens made covering the entire window from top to bottom, so that it does not interfere.

Q. Why did you put those in?

A. I put those in to keep the house from catching fire and to keep out the live cinders.

Q. From your observation with the cinders flying, do you find that they fly from the smokestack alive?

A. Yes, sir.

Q. And they float back and down, do they not?

A. That depends on how the wind blows.

Q. Take it on a quiet day?

A. Take it on a quiet day, the motion of the train going, if it is going at any great speed, they float backward and spread out.

Q. And down to the ground?

A. Yes, sir.

Q. What would you say, from your observation of einders and of fire from the locomotives that pass your place there, as to whether it would be more dangerous and more uncomfortable, from the smoke, steam and cinders, if the trains passed at the same distance from your house, but 26 feet in the air, raised right up 26 feet, so that they would pass 26 feet above the present grade?

A. In that case, of course the cinders would spread on the roof; they would escape the windows, the front part of the building, and

it would lessen the danger to my building very much.

Q. Because the top of the smokestack would be over your building?

A. Yes, sir.

Q. If it was lowered so that it would reach the second-story window of your house, what then—if the elevation was so that the smokestack would come along the second-story window?

A. In that case, in my judgment, it would be only a question of a short time, unless the windows were kept closed, that my house

would be on fire.

Q. You think if the train was elevated so that the cinders would have further to fall, from an elevation, that it would be more dangerous?

A. If the windows were open, the cinders would enter my room.

Q. As it is, they do not fly up to your upper windows?

A. Yes, sir, they do. As the train goes by the cinders catch the second story.

Q. Have you a third story?

A. Yes, sir; they do not fly into the third story. As it is there now, the cinders catch the second story of the house more than they do any other story. I know that to be a fact, because I sleep in the second story of the house, and it has been necessary to put new screens there where we never used screens before.

Cross-examination by Mr. BAKER:

Q. You rent this hotel, don't you?

A. Yes, sir.

Q. And you first rented it sixteen years ago?

A. Yes, sir. 58—55

786

- Q. At that time how near did the railroad run to you?
- A. I think the nearest track was 24 feet from my house.

Q. One of the main tracks?

A. Yes, sir.

Q. How many main tracks has the Michigan Central there?

A. It has four main tracks and an additional track.

Q. Is that a side track?

A. No, it accommodates the Lansing, and some switching. There are four main tracks there.

Q. And the tracks go east and west? A. Yes, sir, passenger and freight.

Q. And those tracks you think are about 24 feet? A. No, one of them is within six feet of my house.

Q. I mean the four main tracks.

A. The nearest one to my house is one of the main tracks.

Q. I thought they had four main tracks in there, and now have put in another?

A. Yes, and that is one of the four main tracks.

Q. That makes five?

- A. No, sir. You asked me how many main tracks, and I said four. One of those tracks nearest my house is one of the four main tracks.
 - Q. Then they have abandoned one of the old main tracks?

787

Q. How many were there before they put that in?

A. There were four tracks there before; there is another within the last six months, so far as the tracks are concerned.

Q. There were four before?

A. I don't know whether they called them main tracks at that time or not. Now under the new arrangement they have an east and west track for freight, and they have an east and west track for passenger, and then they have an additional track that accommodates the Lansing as it swings around to the north.

Q. So that they have five now?

A. Yes, sir.

Q. Before there were four?

A. I think there were five before, but one of those five was a sort of a switch track. They used to do switching in front of my house, making up trains.

Q. How close did that track come to you?

Which one?

Q. The old one. A. What old one?

Q. You tell us, I can't understand you at all.

A. I say they have put in a track that comes within six or seven feet.

Q. They took out the platform?

A. Yes, sir.

Q. So that the track itself is within six or seven feet?

A. Yes, sir.

Q. The rail?

A. Yes, sir.

Q. So that the cars are over the rail about two feet?

A. Yes, sir.

Q. So that they come within three or four feet of your building?

A. Yes, sir.

Q. There is a track there like that?

A. Yes, sir.

Q. How long has that been there?

A. About six months.

Q. And that you say is one of the main tracks for the accommodation of the Lansing?

A. Yes, that is what is called their east-bound track for

788 freight.

Q. Before that, how near did one of those tracks come to

you? A. I should think about 14 or 15 feet.

- Q. How many years did it operate there in front of you?
- A. It operated at that distance about 10 years. Q. And before that how far was it from you?

A. Previous to that time, the track was still further.

Q. How far?

- A. It was four or five feet further. In rearranging their tracks, hey moved them.
- Q. For four or five years before that, they came within 20 feet of vou?
 - A. I should think about 24 or 25 feet.
 - Q. You have been there all those years? A. Yes, sir.

Q. And you have operated a hotel there?

A. Yes, sir.

Q. You have maintained the hotel there because the railroad was n front of it?

A. Because there was business there for a hotel.

Q. And there has been business?

A. Yes, sir.

Q. You have done a successful business?

A. What do you mean by a successful business?
Q. You have made a living, you are still at the old stand?

A. I am still there, still hanging on.

Q. And can pay your rent?

A. Do you want me to give it away?

Q. No.

A. I am somewhat behind on my rent, and I have hardly seen e time when I was not.

Q. But you are still there in business? A. Yes, sir, my landlord has confidence.

Q. During these ten years that the track ran within 14 feet you, you did not have to put screens in your windows, did you?

A. We did; we put screens in the windows to keep out flies.

Q. I mean to keep out the cinders?

A. No. sir.

Q. It is only since the cars came within four or five feet of you that you have put screens on the entire front?

A. It is only since the new track was put in that we have put in

screens of that kind.

Q. Now the railroad there runs on the same level as the building, or substantially, your building is probably 18 inches or two feet above the sidewalk?

A. Yes, sir.

Q. And the height of the smokestack comes right along to your second story?

A. Yes, sir.

Q. During the ten years that it was operated in that position, was your house set on fire at any time by the engine?

A. No, sir.

Q. During the four or five years before that, when they were 20 or 24 feet away, was your house set on fire by the engines?

A. No, sir.

Q. During the five or six months that the trains have been operated within six or seven feet of your premises, with the screens that you have put upon your windows, has your house been set on fire?

A. No, sir.

Q. Do you keep the building insured?

A. No, sir, I do not keep my furniture insured. 790

Q. Why?

A. Because the insurance is so high.

Q. You are not insured at all? A. No, sir.

Q. Did you ever get a rate?

A. I have had several insurance men speak to me about it, but when they came and looked the ground over, they would not even give me a rate.

Q. You are right in the midst of a big railroad property?

A. Yes, sir.

Q. Railroads on all sides of you?

- A. On both sides of me. I guess you can safely say on three sides.
 - Q. You are right at the junction?

A. Yes, sir.

Q. How long have they had these extension-front spark-arresters on these engines?

A. I cannot say exactly when they commenced. I think I have

seen the first on the Grand Trunk six or eight years ago.

Q. There is no doubt but what that appliance has reduced the amount of smoke and cinders largely?

A. There is no doubt about it in my mind.

Q. It is nowhere such a nuisance as it used to be?

A. Not as bad as it used to be.

Q. I suppose some trains run right by you without stopping?

A. Yes, sir.

Q. Freight trains and passenger trains?

A. Yes, sir.

Q. Do not stop there at all?

A. No, sir.

791 Q. So that they go by with the engine working at full stroke?

A. I think 30 miles an hour, regardless of life or property.

Q. When they go by, running full tilt like that, there are a great deal more cinders than when they slow up?

A. They throw cinders when they give the locomotive steam,

that is when it flies out in a perfect cloud of red cinders.

Q. As I understood in your direct examination, when they go by running at full stroke, there are a good many more than at any other time?

A. Yes, sir.

Mr. Charest: You have been there for 16 years?

Q. Do you know of any fire that has occurred by the sparks coming out of the smokestack within that time?

A. Yes, sir.

Q. How many? A. I know my wood shed caught fire in the night-time.

Q. Are you positive it was from the engine?

A. No, I don't know what else set it on fire; I don't know of anything else.

Mr. Dickinson: Before this new track was laid, was the time

when you had the platform?

- A. They tore the platform away so as to make room for the track.
- Q. Before this platform was torn away to make way for this near track, was the time when, sitting on the platform, you got sparks in your pocket?

A. Yes, sir.

Q. And you got charred holes in the platform?

A. Yes, sir.

Q. The passenger trains pulling along there stop near your platform?

A. Yes, sir.

792

Q. All passenger trains stop at the junction?

A. They used to stop, but they do not all stop now. They have what they call the interlocking switch, and they go right through. Q. When the track was 24 feet away, every train stopped?

A. Yes, sir.

Q. That was within how many feet of your place?

A. Twenty-five feet.

Q. And they were either just coming to a stop or were just starting out?

A. Yes, sir.

Mr. Lesher: I would like to know whether your house is a brick house?

A. Yes, sir.

Q. Have you any idea how many trains pass a day?

A. No, I have no idea.

Mr. Baker: Over a hundred, are there not?

A. More than that, over 200.

Q. What is your wood shed made of?

A. Boards, unpainted.

Q. Where was it?
A. West of my hotel, from the botel going west. Q. So that the railroad runs right alongside of it?

A. Yes, sir.

Q. It was made of wood? A. Yes, sir; dry, flat roof.

Q. Where did it get on fire?

793 A. At the west end of the wood shed. Q. What was there there?

A. Shavings, and split wood and kindling.

Q. It caught in there?

A. Yes, sir.

Q. You took it away?

A. We got water on it and put it out. Q. Did you nove your wood shed?

A. No; it is there yet, taking the chances. Q. Did you take the shavings away?

A. Yes, sir.

Q. You have been there ever since without it catching fire?

A. It has not caught fire since then.

Mr. Dickinson: Where is that wood shed, with reference to the hotel?

A. Right on the line of the Michigan Central, going west. Q. The Michigan Central trains always stop there, don't they?

A. Not now; they used to stop in front of my house. If you are speaking of the nearest track to my house, that is the track for east-They do not stop there. bound freight.

Mr. RIVARD: Was the fire inside of the shed, or did it start on

the outside?

A. That end of the shed was on fire, roof and all, by the time we got out to it. Whether it started from the rubbish inside that end of the shed, or whether the roof caught, I don't know.

Q. Could a spark get inside? A. It is a cheap thing.

Mr. Baker: Did you ever get that wood shed insured? A. No, sir.

794 Mr. Dickinson: You simply did not insure because you could not get any insurance?

A. Never got any rate.

Q. Are you familiar with the fire statistics? A. I got the report of the fire commission.

Q. Do you know how many fires were set by sparks from locomotives in the last year?

Mr. BAKER: I object to his stating what the report shows.

Q. Do you know how many fires were set by locomotives in this city?

A. I don't know of my own knowledge; I know from the reports

of the fire department-64.

Mr. Baker: Where did you get that?
A. In the report of the fire commissioners.

Q. What does that include?A. That includes the bridges.

Q. Have you got that report with you?

A. No.

Q. Who showed it to you last?

- A. When this bridge question came up, the attention of the common council was called to it.
 - Q. How many of those were bridges? A. I won't undertake to say that.

Q. Most of them?

A. To the best of my recollection, nearly all of them.

Q. That was when they had wooden bridges just above the smokestack?

A. The same as they are now.

Q. They have put in an iron bridge on Fort street?

A. The covering is wood.

Mr. Dickinson: Do you do any washing at the hotel?

795 A. Yes, sir.

Q. Where do you hang your clothes?

A. West of my hotel, in the yard. Q. Where is west of your hotel?

A. On Junction avenue, the hotel fronts, and it is on the south line of the Michigan Central roadway, so that we are as near to it as we can get. We border on the right of way of the Michigan Central railroad.

Q. West of the real part of the house?

A. Yes, sir.

Q. The main track, on which we come in on the Michigan Central, comes in front of the hotel?

A. All the Michigan Central tracks pass in front of the hotel.
Q. The Michigan Central tracks go west of your front, as I understand it?

A. The house was built to front on the railroad.

Q. Trains come from the west, and they come in front of your

hotel; where is the yard that you speak of?

A. The hotel was built so as to front on the railroad. Now changes have been made, so that the hotel front is cut off, and you have to call the street the front of the hotel now.

Q. It is facing this way?

A. Yes, sir.

Q. With reference to the front, that was the place where you hang clothes, behind the hotel?

A. It might be called behind the hotel. There is nothing to protect the clothing from the sparks or the smoke of the locomotive.

Q. Does it appear on the clothing?

A. Yes, sir, especially on a damp day, if the wind happen to blow that way.

796 Q. It blackens it?

A. It compels the help to rinse it over again.

Q. And if the wind is the other way, and blows away from the yard, the clothing is protected?

A. Yes, sir.

Mr. Baker: Suppose these are the five main tracks of the Michigan Central, your house is situated with reference to that, like that?

A. Yes, sir. This is Junction avenue, and that is the west; that is the yard of the hotel; here is where we hang our clothing.

Q. Where is the wood shed?

A. The wood shed joins the hotel here, and comes here.

Q. How big is it?

A. I should think it is about 30 feet long.

Q. How big is your building?

A. About 70 feet long.

Q. How big is it that way?

A. About 36 feet wide. Q. There is a street here?

A. This is Junction avenue.

Q. Where does the road cross?

A. The Wabash crosses right at this corner, in that shape.

Q. How many tracks in there?

A. One track. Q. No more?

A. That is all there is, and then there is the Lake Shore along there.

Q. How many tracks?

A. Two tracks.

Q. Where are there any more tracks?

A. South of that, if you want to go far enough south.

797 Q. Where is the depot, right over here?
A. Over here—the Grand Trunk depot.

Q. And there is a set of tracks running in there?

A. Yes, sir.

Q. Have you any other buildings?

A. A barn.

Q. Have you any street on the south side?

A. Yes, sir, a forty-foot street.

Mr. Charest: Did you ever get any damages for running so close . to you?

A. No, sir.

Mr. BAKER: You went there because the railroads were there, did you not?

A. I went there because I thought there was hetel business there.

JAMES A. JONES, sworn for respondents.

Examined by Mr. Dickinson:

Q. How long have you lived in Detroit?

A. Since 1864.

Q. What is your age?

A. 46 years.

- Q. What business have you been engaged in?
- A. Insurance and real estate. Q. During the whole time?

A. No; since 1869.

Q. What kind of insurance, life or fire?

A. Fire insurance.

Q. You are somewhat familiar with real-estate values also in the city?

A. Yes, sir.

798 Q. What class have you known in real estate?

- A. All classes; buying and selling for myself and selling for others.
 - Q. Business property and residence property?

A. Yes, sir.

Q. Do you know the Backus property?

A. Yes, sir.

Q. Do you know the planing mill?

A. Yes, sir. Q. Have you been inside of it?

A. Yes, sir.

Q Have you inspected with reference to insuring it also? A. Yes, sir.

Q. For the purpose of getting at its value to some extent?

A. Yes, sir.
Q. You know something of the values of real estate?
A. Yes, sir.

Q. What, in your judgment, is the value of that property as it stands, real estate and all?

A. About \$200,000.

Q. You know its situation as it stands?

A. Yes, sir.

Q. Suppose there should be added to the conditions an elevated structure on River street, standing about 14 feet in the clear above the road, or more, spanning the entire roadway from curb to curb, upon which should be placed three tracks, over which should run the trains of four railroads-the Canadian Pacific, doing business in Detroit, the F. & P. M., the D., L. & N., and the Wabash-with all the business that they do in passenger business in Detroit, and

with such freight business as the D., L. & N. and the F. &

799 P. M. have with Detroit, except lumber and coal, what is called the package business, so that the top of the tracks will extend about 26 feet above the railroad, and these trains were to be hauled by the locomotives of the several roads, what, in your opinion, would be the effect of such a structure upon the Backus property?

59 - 55

Add to that, that in approaching the Backus property the trains must go up a grade of $52\frac{1}{2}$ feet to the mile, what would be the effect. in your opinion, of the value of the Backus property?

A. For his purpose, I think it would destroy it almost entirely.

Q. Speaking as an insurance man, would the fire rate be increased?

A. Decidedly.

Q. In your judgment, how would the fire risk be increased?

A. With that frame dust-arrester it would make the dust and shavings building almost uninsurable; the others it would increase from 25 to 50 per cent.

Q. The dust and the shavings building is the structure with the

frame ventilator on top?

A. Yes, sir.

Q. And upon the other building you think the increase would be from 25 to 50 per cent.

A. Yes, sir.

Q. In the insurance business, in the ordinary run of insurance business, do you insure the full value?

A. We like to get from 80 to 85 per cent.

Q. Is it usual for the owners of a building and a business to take part of the risk themselves?

A. Yes, sir.

Q. If this risk would be increased, Backus being insured 800 to the extent of \$88,000, do you think that the running of this elevated road would make it necessary for them to take other insurance and more insurance?

A. They certainly would have to take a good deal more. Q. What have you to say as to the need of their increasing their

insurance?

A. If I owned the property I should try to get all the insurance I could.

Q. Have you any doubt about it increasing the fire risk?

A. Not the least.

Q. Have you any doubt about its being destructive of his chances for insuring to a greater amount?

A. I think the chances of getting insurance at all, in good com-

panies, would be very great.

Q. In your business, what are your relations to your companies? A. I am local agent in the city, and general agent in the State.

Q. For what companies? A. The Western of Toronto, the United States of New York, and Granite State of New Hampshire; and in my local agency, the Western, the United States and the Granite State and the Kings county.

Q. How much insurance do your companies have in the State? A. They take between \$80,000 and \$90,000 every year in pre-

miums.

Q. Can you give us the grand total of the risks?

A. I could not tell that.

Q. In taking insurance, do you, after inspecting an application

for insurance, pass upon it finally, or does it have to go to your board?

A. I pass upon everything in the city in my agency; I do 801 not belong to the board.

Q. Do you have to send it to your companies?

A. No, sir; I use my own judgment. Q. You can actually issue the policies?

A. Yes, sir; and if they are not satisfied, they cancel it.
Q. Do you remember when the transit road, or the connection with the union depot, ran through the Backus lumber yard?

A. Yes, sir.

Q. It now runs through there, crossing the lumber yards?

A. Yes, sir.

Q. How wide is the roadway through there?

A. I could hardly tell; I should think about 40 or 50 feet. Q. Have they kept that lumber yard insured, do you know?

A. Yes, sir.

Q. Before this road passed through?

A. Yes, sir.

Q. And after it passed through?

A. Yes, sir.

Q. How were the rates?

A. The rates were increased, I think, nearly one per cent., and it was divided up into sections; they had to take so much insurance on each section.

Q. How much was the rate increased in the section nearest the

track?

802

A. It was increased all over equally; because the sections would burn if the section nearest the track would. Q. You averaged it by increasing it all over the entire yard?

A. Yes, sir.

Q. Was there any increase in the general average; were

they required to carry more?

A. They had to carry more, because there was insurance put on specifically in different sections; before, if they had \$50,000, they could apply that anywheres, now they have so much on each section.

Q. How much did they increase that?

A. Nearly double that amount.

Q. In other words, by increasing the general average you would increase the amount of the risk and the insurance on the lumber yard, because he had to put double what was on before?

A. Yes, sir.

Q. Was it double or more than double? A. About double; I don't recollect exactly.

Q. What percentage of insurance did it cost them before?

A. I think they were paying $1\frac{1}{2}$, and I think afterward it was $2\frac{1}{2}$ per cent. on the lumber yard.

Q. And the requirement to carry more insurance made the in-

surance double?

A. They were obliged to.

Q. This is the railroad that comes into the union depot yard and is the track for the union depot, now used by the Wabash?

A. Yes, sir.

Q. And only by the Wabash?

A. Yes, sir.

Q. After the union depot is established there will be four roads running through there?

A. I understand that is the way.

803 Cross-examination by Mr. Baker:

Q. Were you in the insurance business in 1881 and 1882?

A. Yes, sir; I have been in it since 1869?

Q. There was a board of underwriters here then?

A. Yes, sir.

Q. And Mr. Rothermal was the rate-fixer?

A. Yes, sir.

Q. You were on the jury in the Backus case when the right of way was condemned through the Backus property, were you not?

A. Yes, sir.

- Q. And you heard Mr. Rothermal's testimony, that the rate would be increased?
 - A. I heard his testimony; I don't recollect what it was now.

Q. You heard him testify in the case?A. Yes, sir.

Q. He was called as a witness for Mr. Backus?

A. I don't recollect that.

Q. But you were on the jury and heard his testimony?

A. Yes, sir.

Q. And you were a member of the same board?

A. Yes, sir; at that time.

Q. And he fixed your rates, did he not?

A. At that time.

Q. So that after the case was decided, you took some insurance on this property?

A. I had insurance on the property. I have had insurance for Mr. Backus for 12 or 13 years.

Q. You had insurance on the property at that time?

A. Yes, sir.

Q. At 1½ per cent.? 804 A. I think it was 1\frac{1}{2}.

Q. How many years had you done business with Mr. Backus?

A. It must have been 12 years.

Q. Before that?

A. Yes, sir.

Q. You have been doing business with Backus 12 or 14 years?

A. Yes, sir.

Q. And had insured this lumber yard?

A. Yes, sir.

Q. About how much insurance did you have on it?

A. In the neighborhood of \$250,000. Q. And he paid you 11 per cent.?

A. I think that was it. Q. When you insured it after the railroad went through, who fixed the rate?

A. I think Mr. Rothermal fixed the rate.

Q. Mr. Rothermal fixed the rate in accordance with his testimony, he raised it one per cent.

A. He fixed the sections; it was specific.

Q. He fixed the rate at an increase of one per cent.?

A. He fixed the rate at so much on the sections or so much on the yard, and they took their choice. They would be obliged to carry half as much insurance again by taking specific insurance, and they had their choice.

Q. Which did they take?

A. They took the specific and then they took the broad.

Q. How much was the rate increased?

A. On sections, it was increased one-half per cent., and one per cent. broad.

Q. You would only increase it one-half of one per cent.?

A. Which was equal to one per cent. broad. 805

Q. You gave him the right to a blanket policy on the whole yard, with one per cent. increase?

A. Yes, sir.

Q. And that was what Rothermal had previously testified to, and what he did when he came to fix the rate?

A. I don't recollect what he did testify to.

Q. You remember he was called as a witness? A. Yes, sir.

Q. And that he testified in the case?

A. I believe he did.

Q. Did you ever insure the Backus lumber mill?

A. Yes, sir. Q. When?

A. I insured the old mill and paid for it, and I insured the present mill.

Q. When did you insure the old mill?

A. We had the old mill insured when it was burned up.

Q. How many years ago?

A. I insured the lumber and mill for the last 12 or 13 years.

Q. Before they burned?

A. Three or four years before it burned.

Q. How much did you pay on it when it burned?

A. Somewhere about \$50,000.

Q. Was that all the insurance on it?

A. I think I had it all, but I am not positive.

Q. I suppose they made proofs of loss?

A. Yes, sir.

806

Q. What set it on fire?

A. It was unknown. I don't think they knew what it was.

Q. Did the Michigan Central set it on fire?

A. I think not.

Q. It was some internal fire?

A. I think it was spontaneous combustion, rags in the engineroom were the cause of it.

Q. What did you insure the old mill for?

A. 5.75, I think.

Q. What do you insure the new mill for?

A. 5.25 and 4.50.

Q. Have you any insurance on it now?

A. Yes, sir.

Q. How much?

A. \$20,000.

- Q. Do you know this insurance of Mr. Wardle?
- A. I do not. I know there is additional insurance. Q. You don't know what rate they charge for it?

A. No, sir.

Q. What is your rate?

A. 5.25 on the mill and 4.50 on the boiler-house.

Q. You separate them?

A. Yes, sir.

Q. How much on the shavings-room and the boiler-room?

A. I forget the proportion.

Q. On the main building, how much do you get?

- A. 5.25 on the main building and 4.50 on the boiler-room.
- Q. The main building is more dangerous than the boiler-room and the dust-arrester?

A. Yes, sir.

Q. Does that include the stock? A. The same rate on the stock.

Q. How much on the main building?

A. My policies cover \$125, each one, on the boiler and 807 engine room, and the rest is on the mill.

Q. You put 5.25 on the main building and 4.50 on the boiler and engine room, and 4.50 on the dust-room and the shavings-room?

A. Yes, sir; I don't think there is any insurance on the dust-

Q. You think that the presence of this elevated road in River street, with the building left just as it is, would increase the rate from 25 to 50 per cent.?

A. Yes, sir, at least.

Q. That is, where it is 5.25, it would increase it 2.518 per cent.?

A. If we would insure it at all. Q. What do you base that on?

A. The liability of the sparks blowing into the dust-room.

Q. In that connection, will you tell us how much of this rate, 5.25, is charged because the Michigan Central goes alongside of the property?

A. I don't think there is over 50 cents, probably, or 75 cents. I don't think the Michigan Central is a very great hazard to this mill,

because it is down low.

Q. You think the Michigan Central running alongside is not much of a bazard?

A. No.

Q. You don't charge anything for that?

A. I should charge something, because there is a shed. Q. You think it is about one-half of one per cent.?

A. From a quarter to one-half of one per cent.

Q. But a railroad on the other side you would charge 2.518 for?

A. The dust-arrester is away from the Michigan Central. 808

Q. I suppose you are familiar with dust-arresters and shavings-rooms?

A. I know something about them.

Q. Do you think it would be impracticable to protect this building?

A. I think it is impractical to protect them open.

Q. This shavings-room is solid next to the street, all except the door and the bottom of the wall?

A. The sides are not, and the opening in the shavings vault is

Q. Is not the end that abuts on the street solid, with the exception of a door below?

A. Yes, sir.

Q. That is a brick wall, is it not?

A. Yes, sir.

Q. It has a gravel roof?

A. Yes, sir.

Q. And it is a brick wall on the inside, is it not?

A. Yes, sir.

Q. There is a small window in it?

A. Two or three windows in there, I think.

Q. A solid brick wall on the west?

A. Yes, sir.

Q. So that there is an opening on the side, and a little beyond the window there is a door?

A. That goes into the engine-room.

Q. Do you think it would be impractical to so conduct that shavings-room as to do away with all increased risk?

A. I don't think it is possible.

Q. What is the reason? A. From the elevated road, the sparks flying in.

Q. I am talking about the shavings-room. 809 A. The sparks flying into the shavings-room.

Q. They simply load shavings into that door, back a wagon in there and load shavings?

A. The shavings come down through a spout.

Q. There is a door by which they load shavings into the wagon?

A. Yes, sir.

Q. Do you think it would be impractical to put a sheet-iron covering over that door so as to protect them?

A. If it was to be kept closed, it might be protected, but it has to

be open.

Q. Could they not put a sheet-iron roof over that door so as to protect it, and then could they not keep the shavings clean around the door, and would there be any risk?

A. It is pretty hard to tell where a spark is going.

Q. If you had the roof running out to the elevated road, there would not be much danger from it, an iron roof?

A. They might get in under the roof.

Q. There would not be much hurt?
A. There would be so much that we would not care to assume the risk.

Q. Let us go back to the dust-arrester; that is a solid inclosure,

all except the top, this lattice-work?

A. Yes, sir.

Q. Do you think it would be impractical to protect that?

A. And keep it open?

Q. Could they not put wire screens on each side of that?

A. That would not keep the sparks out entirely.

Q. You think it would burn up in a day or two if the road was in operation?

A. I think it would be liable to the first day.

Q. Don't you exaggerate this insurance matter?

A. Not a bit. Q. You think the agent here who testified that the increase would only be one per cent., is entirely off his base?

A. I do.

810

Q. Did you ever testify for Mr. Backus before?

A. Yes, sir.

Q. In any of those old cases?

A. In this same case.

Q. That is the only time?

A. Yes, sir.

Q. But you have done business with him a great many years, and were on the jury before?

A. Yes, sir.

Q. And you were in favor of high damages for him?

A. In favor of justice.

Q. You were the highest man on the jury, were you not?

A. No, I think not.

Q. Do you testify that you were not the highest man?

A. I did my duty on the jury.

By Mr. Dickinson:

Q. Who was the attorney for Backus in that case?

A. Fred. A. Baker.

Q. I was not in the case, was I?

A. No, sir, or they would have probably got more.

WM. P. TRIPP, sworn for respondents.

Examined by Mr. Dickinson:

Q. Where do you live?

A. In this city.

811 Q. How long have you lived in Detroit?
A. About 14 or 15 years.

Q. What is your business?

A. Lumber inspector.

- Q. Whereabouts are you now engaged in the lumber-inspection business?
 - A. With A. Backus, Jr., & Sons. Q. What is your position there?

A. Foreman in the yard.

Q. And inspector?

A. Yes, sir.

Q. What was your business before you went to work for A. Backus & Sons?

A. I have been in the same business.

Q. For whom?

A. For the Michigan Central railroad for 12 years.

Q. For any one else?

A. Yes, sir, with the Parsons Lumber Company.

Q. You have been engaged in the inspection of lumber during your whole life?

A. Yes, sir, since I have been a boy.

Q. About 30 years?

A. Yes, sir.

Q. In the matter of lumber coming into the Michigan Central yard, or going into the city of Detroit, will you please tell the jury what is first done with a car-load of lumber that goes over the F. & P. M. and the D., L. & N. on its arrival, for delivery?

A. The first thing is to get the stakes out of the car.

Q. What next?

A. To get a good broom and put that into active service; get on top of the car and take the cinders off the car.

812 Q. The first business is to sweep the cinders off the lumber after the stakes are out?

A. Yes, sir.

Q. To what extent do the cinders accumulate on this lumber that

comes over the F. & P. M. from the interior of Michigan?

A. It makes a great deal of difference where the car has been located in the train. You find a car of lumber that was next to the engine and the accumulation of cinders is greater than if it is in the rear end of the train.

Q. How far back do the cinders extend?

A. Usually from eight to ten cars, in fact from ten to twelve cars.

Q. What is the length of a lumber car?

A. 33 to 34 or 36 feet.

Q. How far back will you find the cinders?

A. Usually five or six cars we find them to a large extent; the lumber is well covered.

Q. What do you call a large extent?

A. Where we can get a peck or a half bushel on the top of the car.

Q. Have you recently seen a lumber car come in on the F. & P.

M. in your yard?

A. Yes, sir; we received one last night, which was being unloaded when I left the yard this noon.

Q. Who took off the cinders?

A. I swept the top of the car myself before starting this morning.

Q. Where did this car come from?

A. From Saginaw.

Q. Was ticketed down into your yard?

A. Yes, sir.

813 Q. Came by what road?

A. By the F. & P. M. and the Wabash.

Q. Did you take any of the cinders off that car?

A. Yes, sir.

Q. What did you do with the cinders?

A. Those that I kept are here in this box.

Q. Were there more cinders on that car of lumber than are in this box?

A. Yes, sir.

Q. How much more?

A. Fully as many more.
Q. You took all these off of one car-load of lumber on the F. & P.
M. car?

A. Just what I got handy.

Q. You took off as many more?

A. The car was not unloaded when I left.

Mr. Charest: I suppose this lumber that comes in—in inspecting the lumber, do you find any fire specks or places on the boards where it had been burned?

A. We find that more in the yard near the tracks where the lum-

ber is piled up.

Mr. Dickinson: I suppose this lumber that comes here is not put in the dryer?

A. No, sir.

Q. It usually comes from the mill, damp?

A. Yes, sir.

Q. Do you know how long it took this car to come down here?

A. We have the shipping bill. The car came into our yard last night.

Q. This is the regular form of the ticket?

A. Yes, sir; it reads as follows: "Car number 1726, via Romulus, care Wabash road, Backus, Jr., & Sons, shipped by Strong & Sweet, June 26, 1891."

Q. You have taken the cinders off of that; did you select that

car specially, or is that an average amount as you get it?

A. That car has much less than a great many.

Q. Have you taken any records of any other F. & P. M. cars?

A. Yes, sir; last winter we had a great many more. Q. You were called upon to take the record of those at that time?

A. Yes, sir.

Q. How does this average up with the regular F. & P. M. from Saginaw, the amount you found on this lumber?

A. You find a great many that have more on.

Q. How as to others having less?

A. There are not many that have less.

Q. Do you see cars coming in over the D., L. & N.?

A. Yes, sir.

Q. How do they compare, as far as cinders are concerned, with the cars that you have sampled?

A. Not much difference, that I can see.

Q. What effect have the cinders upon the machinery? Do you know anything about its effect, if the work of cleaning is not well done before it goes into the mill?

A. I notice it is damaging to the planer knives and the ma-

chinery.

Q. All the fine machinery in the mill?

A. Yes, sir.

Q. Is it possible to get all this grit off?

A. No, sir, even though we sweep it we cannot get it all off.

Q. In your business, you have been engaged in and about 815 the yard there, where Backus receives his lumber from the river, have you not?

A. Yes, sir.

Q. You know the cars of the Wabash, there?

A. Yes, sir. Q. Your lumber yard is down here at Eighteenth street, is it not?

A. Yes, sir.

Q. And the Wabash crosses the yard?

A. Yes, sir.

Q. That is the union depot track, is it not?

A. Yes, sir.

Q. What road now uses it?

A. At present the Wabash and the Canadian Pacific, only.

Q. How wide is the right of way?

A. I don't remember now. Q. About 60 feet, is it now?

A. Yes, sir.

Q. How many main tracks through there? A. One main track and two side tracks.

Q. One main track, over which the trains of the Wabash and Canadian Pacific now run?

A. Yes, sir.

Q. Have you observed the effect upon the piles of lumber of the Wabash locomotives?

A. Yes, sir.

Q. What do you find the effect upon the lamber siles?

A. Where live cinders, as they are known by railroad men, fall upon the lumber, they burn holes in the dry lumber.

- 816 Q. What kind of lumber do you pile nearest the track? A. They aim now to pile common lumber down there.
 - Q. How far is it from the main track to the piles of lumber? A. About 30 feet from the main track, I should think.
- Q. Upon those lumber piles along the main track, you find there is an accumulation of cinders since the Wabash went through there?

A. Yes, sir.

O. To what extent?

A. Quite a large extent, where they are piled there any length of time; in a few months they accumulate.

Q. Is it to such an extent that it is required?

A. Yes, sir.

- Q. What is the nature of those accumulations as compared with this?
 - A. It is something finer than that. Q. Does it discolor the lumber?

A. Yes, sir.

Q. How far from the track have you found burned spots in the lumber?

A. One pile I noticed nearly 60 feet.

Q. What do you find upon this pile?

A. What we call the covering boards, are burned in a good many places, some places near together.

- Q. You have covering boards over the piles?
 A. Yes, sir, we have to keep them covered up, especially along the track.
- Q. To what extent are there burned or charred places in the lumber near the track?

A. Some.

Q. Give us an idea, if you can, of the quantity of cinders you find upon the piles, 30 feet from the track, we will say, as near the track as you find it, cinders upon the lumber?

A. I swept one board last winter and I found about a pint of these fine cinders.

Q. How near the track was that?

A. I think that was a pile between 50 and 60 feet.

Q. Is that an old pile?

A. Yes, sir.

Q. Had been there some years?

A. Yes, sir, had been there some time. Q. About how long had that been there?

A. I can't tell; it was there when I came there last August.

Q. Do you find on the other piles of lumber near the track, since you came there, any accumulation of cinders and this burned appearance?

A. Yes, sir.

Q. You find it to be the general rule that the tops of the cover-

ing boards are charred at a greater or less distance from the track, and cinders upon the piles?

A. Yes, sir.

Q. You have no other road running near you except this Wabash single track?

A. That is all.

Q. How far from the dock front does this run?

A. Several hundred feet.

Q. I suppose you have seen cars running in and out during your whole life in the railroad business, in the lumber yards and in the course of your business?

A. Yes, sir.

Q. Did you ever see one, up to this date, that did not throw sparks and cinders?

A. No, I never saw anything of that kind.

Q. In running nights there, do you see any locomotive that does not throw cinders and fire out of its smokestack?

A. No, sir.

Q. Have you ever seen one do its work that did not throw as it is running?

A. No, sir.

- Q. To what extent are you troubled in that work in the yard with smoke and steam?
- A. We are troubled very much with the dense smoke that comes out of the smokestack.

Q. Is that a matter of daily occurrence, or only occasional?

A. It is continual.

Q. To what extent does the smoke flow upon you in that lumber yard?

A. So much so that it discolors the lumber in a very short time after it has been piled in the yard.

Q. Give us some idea of the volume of smoke?

A. It comes in such dense quantities at times that we are unable to see anything a few feet away. We had a case of that kind last week. Sometimes where we are inspecting lumber off a car we have to stop our work while the train is passing by.

Q. How about steam, is that a matter of common occurrence?

A. That with the smoke.

Q. Does it come out in large quantities?

A. Yes, sir.

Q. You have your office somewhere near there?

819 A. Yes, sir.

Q. You have an office quite near the track?

A. Yes, sir.

Q. What effect do these trains have, passing on the single track, in the matter of noise?

A. So much so that we cannot use our telephone when the train is going by, at least I cannot hear very well.

Q. Did you inspect locomotive No. 35 on the Wabash; did you look at and see it work?

A. I see it every day.

Q. Has your attention been recently called to the claim that she has a perfect smoke-consumer and spark-arrester?

A. I heard that was the fact.

- Q. Have you observed that particular engine since?
- A. I was more particular when I heard that was the fact. Q. How often have you seen that engine running about?

A. I have seen it on an average eight or ten times a day.

Q. Do you see it in the night?

A. Several times.

Q. Have you observed how beautifully clean she is and how she does not throw any smoke or cinders?

A. I have not observed that.

Q. Do you say she does throw cinders?

A. Yes, sir.

Q. And smoke?

- A. The same as the rest of them, I think; it seems to be the same color.
 - Q. At night do you see the sparks go out of her smokestack?

A. Yes, sir.

Q. How high will they float. I suppose the wind has something to do with that?

820 A. Yes, sir, and the speed they run. I could not say as to that, but I have seen them go out of the smokestack quite frequently, and that is all owing to how hard they are working the engine. If they are working the engine hard and have a heavy road, a good long train, there are more sparks of course.

Q. What do you call a heavy load, as you have seen No. 35

working?

A. I never saw her with over 12 or 13 cars, which would be a light load for an engine nowadays.

Q. She still throws sparks?

A. Yes, sir.

Q. Have you seen her running with any number of cars that she

did not throw sparks in the evening?

A. I saw her a little while the other evening light; there were no sparks, but when they reversed the engine to go back, it threw sparks.

Cross-examination by Mr. BAKER:

Q. How long have you worked for Backus?

A. Since last August.

Q. Where did you work before that?

A. For the Parsons Lumber Company.

Q. Whereabouts?
A. In the city.

Q. How long did you work for them?

A. About two years.

Q. Before that where did you work?

A. For the Michigan Central.

Q. Whereabouts?

A. In Detroit.

Q. In a lumber yard?

A. In a lumber yard most of the time, part of the time on the road.

Q. What were you doing for the railroad?

A. Handling their lumber, buying and inspecting. Q. Lumber they used in their railroad business?

A. Yes, sir.

Q. How long did you work for the Michigan Central?

A. Twelve years.

Q. You gathered this off the F. & P. M. lumber car?

A. Yes, sir.

Q. The second thing you have to do when a car comes into the yard is to get the cinders off?

A. Yes, sir.

Q. And you do that?

A. Yes, sir.

Q. You don't have to get a fire-engine and put out a fire the first thing?

A. No, sir.

Q. You have been in that lumber yard down there since last August?

A. Yes, sir.

Q. How many times has the lumber in that yard burned up since then?

A. I have never seen any burn up.

Q. The lumber is piled right alongside of the track?

A. About 30 feet.

Q. There is a 60-foot right of way with the main track in the middle and two side tracks on each side?

A. Yes, sir.

Q. And Mr. Backus piles the lumber right up to his line. How does he pile it, with the ends towards the track, or the side of the piles?

A. The ends towards the alleys.

Q. The alleys run across the track, do they not?

A. Yes, sir.

822

Q. So that there are openings as you pile the lumber; what do you call those?

A. Courses.

Q. So that every board is the thickness of a board apart?

A. Yes, sir.

Q. Those boards go longitudinally along the side of the track, so that there are spaces an inch wide right through the piles?

A. Yes, sir.

Q. That is the way they pile it?

A. Have to do it.

Q. Could not pile it the other way?

A. Not very well.

Q. Why?

A. Because our alleys run the other way.

Q. Why could you not run the alleys the other way?

A. How could you get out of the yard?

Q. You have a street that runs through it, haven't you? A. Yes, sir.

Q. Could you not put the alleys the other way?

- A. No, not to make straight work with it; it would make an extra turn.
- Q. Is there any fence or building put up to protect the lumber from the cinders or smoke?

A. No, sir.

Q. It is all open?

A. Yes, sir.

Q. And the lumber is piled upon the ground on the same grade substantially as the railroad runs?

823 A. Yes, sir.

Q. About how high are those piles?

A. They vary from eight and ten feet to fifteen feet.

Q. Some as high as 20 feet?

A. Possibly some of them 20 feet.

Q. How many million feet of lumber are there down there now? A. Perhaps three millions; I don't know just how much; hardly

that now.

Q. How many is the highest number of feet that you have known in the yard?

A. Since I have been there perhaps over 4,000,000 at one time. Q. Did you ever see that yard when there was 20,000,000 feet of

lumber on it?

A. I don't know that I ever did. I presume there has been though; they could put that much there.

Q. You say this car came down from Saginaw the other night?

Yes, sir.

Q. How did it get into Backus' yard?

A. By the Wabash.

Q. It came from the junction to Romulus and then came in on the Wabash?

A. Yes, sir.

Q. How often do you get a car that way?

A. Sometimes we get 3 or 4 at a time, and sometimes we don't get any, and sometimes we have 8 or 9 in a day.

Q. You get a constant supply of lumber in that way?

A. Certain lumber comes in that way.

Q. What kind of lumber?

A. Usually coarse lumber that comes that way.

824 Q. Why don't you bring it around by water? A. Good lumber usually comes by water.

Q. Why don't you bring this by water?

A. This is special lots.

Q. How many million feet have you brought down since you have been there in this way?

A. It would take some time to say that.

Q. Give us an estimate?

34 U4

A. I presume we have on an average during the winter 3 or 4 cars a day that come that way.

Q. About how many feet to a car? A. They average about 15,000 to a car.

Q. And in the winter time it will average 3 or 4 cars a day?

A. This last winter.

Q. About how many million feet do you use up there a day?

A. We don't use a great many million a day, but 50 or 60 or 90 thousand a day; very often 90,000 a day.

Q. Is most of that received by rail?

A. No, sir.

Q. What proportion of it is received by rail?

A. In the winter of course it is all received by rail.

Q. But in the summer time, what proportion is received by rail?

A. Only odd lots in the summer time.

Q. Odd lots of 3 or 4 cars a day? A. Not that many on an average.

Q. How much on an average; a car a day?

A. Well, probably.

- Q. How much do you get on the Detroit, Lansing & Northern?
- 825 A. We have not had any lately.
 Q. You do get some occasionally?

A. Yes, sir, on all the roads. Q. How does that get to you?

A. It has to come around by Romulus.

Q. But does it not sometimes come into the Michigan Central yards and get to you in that way?

A. Yes, we had some come that way last fall.

Q. But if it does not come into the Michigan Central yard, and come down in that way, it comes around by Romulus in some way?

A. Just according to the way it is billed.

Q. It comes on the Detroit, Lansing & Northern, and then down to Romulus on the Flint & Pere Marquette, and then in on the Wabash?

A. Yes, sir.

Q. About how many cars a day do you get from that source in the winter?

A. We have not had a great deal since I have been there.

Q. About how many thousand feet since you have been there? A. I could not tell; I never thought about it in that way.

Q. Did it average a car a day?

A. No, sir.

Q. A car a week?

A. Hardly that, I think. Q. A car in two weeks?

A. I could not say.

Q. A car in three weeks?

A. I would not attempt to say.

Q. Do you get any hardwood lumber there?

A. Yes, sir.

826 Q. Where does that come from?

A. From all over the State. Q. Does any come on the Wabash?

A. Yes, sir.

Q. A good deal comes on the Wabash?

A. Yes, sir.

Q. What is it, principally?

A. Oak and ash and basswood and maple.

Q. And walnut?

A. And all kinds of hardwood.

Q. About how many thousand feet do you get in there a day of

hardwood on the average?

A. It would be hard to estimate. We sometimes have quite a number of cars come in, and then again we do not have any for some time.

Q. Do you get any hardwood by the river?

A. Yes, sir. Q. Where does that come from? A. Various points up the shore.

Q. What is that, principally?

A. Basswood, maple, some oak-principally maple. Q. Do you ship any lumber out of that yard by rail?

A. No, sir; not now.

Q. Do you ever?

- A. Most of our lumber has to go to the mill to be dressed, and then, in that case, it is shipped right from the mill.
- Q. Have you shipped any lumber out of that yard in the rough, before it was dressed, since you have been there by rail?

A. Yes, sir, a few cars.

Q. How many cars?

827 A. Oh, half a dozen, I presume.

Q. Where did they go?

A. East and south.

- Q. What roads did they go on? A. The Grand Trunk and the Wabash, I presume; I didn't keep much track of it.
 - Q. Did you ever ship any on the Canadian Pacific?

A. No, sir.

Q. You shipped some on the Wabash?

A. Yes, sir.

Q. You say that in this yard some of these cinders will char or slightly burn the wood?

A. Yes, sir.

Q. Where they light on a lumber pile?

A. Yes, sir.

Q. Does it accumulate more on the top of the piles or through the piles?

A. Those charred spots show on the top of the piles.

Q. And the piles are just about the same height as the smokestack, are they not?

A. They are higher than the smokestack.

0400

Q. A little bit higher?

A. Yes, sir.

Q. So that the charred parts are on top there?

A. Yes, sir.

Q. Is the lumber charred through the piles where it goes through these crevices?

A. No, sir; it is fine cinders that goes through the piles.

Q. On these piles of lumber that come in on the cars, they usually have cross-bars, against which the cinders lodge, and there is where you get most of the cinders, is it not?

A. No, sir; you get more on the ends. Q. That is on the ends of the lumber?

A. Yes, sir.

828

Q. That is, it is not piled up very even, and where the ends stick out unevenly is where the cinders gather?

A. Most of them, and they naturally blow off the top and work

down through on the ends of the lumber.

Q. And the farther the train has come, the more the cinders accumulate, I suppose; it depends a little on which way the wind blows and the condition of the weather?

A. And how near they are to the engine.

Q. The closer to the engine, the more cinders.

A. Yes, sir.

Q. Mr. Backus makes a considerable use of the railroad facilities he has there in this yard?

A. Not a great deal.

Q. About how many million feet in a year does he handle in this way?

A. I could not tell without consulting the books.

Q. Well he handles three or four million?

A. It does not all of it come by rail.

Q. He consumes 60,000 a day on an average, year in and year out?

A. Yes, sir.

Q. Does a quarter of his lumber come by rail?

A. No, sir.

Q. Does one-eighth of it?

A. I could not say.

Q. In your judgment, how much of his lumber? You have been there since last August and were there one winter.

A. I have not been there through one season yet.

829 Q. But it is very close to the 1st of August. In your judgment, for the time you have been there, what proportion of his lumber comes there by rail?

A. A very small proportion of it.

Q. What proportion?

A. I would not attempt to say without consulting the books.

Q. You have no judgment about it?

A. I have not had experience enough there in that regard.

Q. Did you hear his testimony in the old condemnation case, that he had all the railroad facilities he wanted?

A. I was not there at all; I don't know anything about it.

Q. You were not a witness in those cases?

A. No, sir.

Q. You didn't hear him testify or say on any occasion that he didn't want any railroad facilities down there?

A. No, sir.

Q. Do you know how much the lumber is damaged in its marketvalue by being piled next to the railroad?

A. Yes, sir, I know it is damaged quite extensively; quite a great deal.

Q. How much a thousand?

A. There are cases where it is depreciated, I was going to say one grade or more, in that class of lumber there, that is, \$6; there is six and seven dollars between the different grades, and we have to sell it for one grade less.

Q. You pile the poorest lumber next to the railroad, don't you;

what does that cost on an average?

A. From eight to ten or twelve dollars for our coarse lumber.

830 Q. How long does it stay there usually?

A. That near the railroad does not usually stay there a great while.

Q. I suppose the longer it stays the more it is damaged?

A. Yes, sir.

Q. How long does it stay on an average?

A. Three or four months; and in some cases, perhaps, six months; there is one pile there, I guess, that has been there six months.

Q. Suppose a pile has been there about six months, how much would it be depreciated in value per thousand?

A. I don't know just the condition of that pile.

Q. Say it is worth \$10 a thousand when it is piled there, how much would it be worth at the end of six months?

A. It is damaged more or less, and they run it through the

machinery-

Q. But you are an expert in this business, and I want to know how much less it is worth. Is it worth 50 per cent. less; would it reduce it to \$5 per thousand?

A. No, sir; not as much as that.

Q. Would it reduce it 50 cents a thousand?
A. I would not attempt to say as to that point.

Q. You would not undertake to fix the depreciation in dollars and cents?

A. No. sir.

Q. Is there any depreciation at all?

A. Certainly.

Q. There is some depreciation? A. Yes, sir, I have said that.

A JUROR: How can you estimate when you don't know what the depreciation is?

A. I could give my judgment.

74U

831 Q. What is your judgment of the depreciation on that? A. In a case of that kind, it is probably 75 cents to a dollar a thousand.

Q. In six months?

A. Yes, sir.

Q. How much would it be in a year if it remained there?

A. It would be more, of course.

Q. How much would it be in two years; the lumber would be

actually worthless in two years, probably?

A. O, no, sir; I have stated in one case that came under my observation, where it has depreciated one grade. Of course that was good lumber, and it depreciated one grade, which is about 6 to 7 dollars, there being that difference between each grade, and then it didn't sell as readily as it would if it had not been piled there—if it had been away from the railroad.

Redirect by Judge CHIPMAN:

Q. The reason that you cannot answer, as to the exact difference, is that the lumber is sent to the mill and handled there?

A. Most of our lumber goes to the mill and is dressed there.

Q. And there the difference, in grade and all that, is settled by them at the mill?

A. Yes, sir; you can judge of lumber a great deal better after it

Q. And they determine that, and you don't actually determine what deterioration there is in that lumber, but it is determined at the mill?

A. Yes, sir.

832

Q. And the parties at the mill can tell better than you?

A. Yes, sir, after it has been dressed.

Q. What engines bring in the Detroit, Lansing & Northern lumber to your yard?

A. The Wabash engines.

Q. On the Michigan Central?

A. No, sir.

Q. Mr. Baker asked you if Mr. Backus does not make use of the railroad there in his business. You said yes. Don't you understand that he pays the railroad for everything that he gets from them?

A. Certainly.

Q. It is not a favor at all, it is business?

A. Yes, sir.

Recross by Mr. Baker:

Q. You have been in the lumber business, or connected with it, for a great many years?

A. Yes, sir.

Q. Is it practicable to run a lumber yard successfully, as the business is conducted at the present time, without railroad connections?

A. It is all owing to the situation.

Q. Do you know of a successful yard anywhere that has not a railroad connection?

A. Oh, yes. Q. Where?

A. In our northern country.

Q. Up where they manufacture lumber?

A. Yes, sir.

Q. But I mean in a country where they sell it?

A. It is very handy to have them.

833 Q. And is it customary to pile lumber right up close to the railroad?

A. Why, yes.

Recross by Judge CHIPMAN:

Q. And is it customary to find these burnt places?

A. No, sir; not usual.

Q. Did you hear my question?

A. I say not usual.

Q. You don't often find burnt places in lumber?

A. No, sir.

Q. And yet you say that you frequently find it down there?

A. Yes, sir.

Adjourned to Wednesday, July 1, 2 p. m.

July 1, 1891-2 р. m.

Mr. Dickinson: By reason of the absence of Mr. Peter Henkel across the sea, we read his testimony in the Backus case, and also his testimony as to the condition of the elevated road in the Kidder case. I read from the Backus case, commencing at page 356.

Peter Henkel, sworn in behalf of the respondents, testified as follows:

Examined by Mr. Dickinson:

Q. How long have you lived in the city of Detroit?

A. About 47 years.

Q. Been an active business man here ever since you came here?

834 A. Yes, sir.

Q. Seen the growth of the city for 47 years?

A. Yes, sir.

Q. Have you known Mr. Backus?

A. Yes, sir.

Q. I think you are a large owner of real estate in this city?

A. Yes, sir.

Q. You are familiar somewhat with the manufacturing interests of Detroit?

A. Yes, sir.

Q. You have seen their growth here?

A. Yes, sir.

Q. Do you know Mr. Backus' property?

A. Yes, sir.

835

Q. Have you seen the proposed superstructure of the union depot entrance into the city along River street?

A. No, sir: I have not seen it.

Q. The railroad will enter about Twelfth street, and will enter by a viaduct along Twelfth street, which is set upon piers or posts, with a stone foundation—foundation below the surface, and will go up to the front of the Backus property, all in front of the Backus property, steadily rising until it reaches the railroad crossing of the Michigan Central, where it rises to 18 feet in the clear above the tracks; but in front of the Backus property, and the entire front of the Backus property, it has three tracks and covers the roadway, that is, the piers upon which it stands are on the curb-line. The structure covers the entire roadway, with the exception of the sidewalks, which there is some dispute about. The sidewalk spaces are

from 4½ to 6 feet wide. There are three tracks and switches in front of the Backus property, and it comes as to the Backus

property, about in proportion as you see by this structure there, this model. The structure coming from Twelfth street here, runs up by the Backus property, and the tracks are upon the Backus front in the street, as you see the tracks here on this model. On the Michigan Central side, on the south side of the street and immediately adjoining the railroad structure, there is a viaduct for teams, made without this railing. I don't know that the railing is solid, but at all events, there is a viaduct for teams that runs by the side of it, along by the Backus property, 24 feet wide; it is 14 feet in the clear.

A. How high from the ground?

Q. It is 14 feet in the clear to the bottom of the girders, leaving just 14 feet in the clear. The structure will stand so that the top rail will be even with the floor of the Backus third story, and, of course, the cars upon the structure in passing to and from will add to that height, and possibly will come above the third story. Now, this railroad will run to the union depot, which is to be opened to all the railroads that desire to come there. There is in the union depot already provided above there, over which the trains must pass to reach it, a freight warehouse for the Flint & Pere Marquette and the Detroit, Lansing & Northern, and any other roads that desire to use it, as it is a freight and passenger depot, and for the passenger depot it professedly is to accommodate all the roads that desire to come there and pass over this track. This will be the only approach. Now, you, knowing the Backus property as you do, you know the business of a planing mill and the work they do there?

A. Yes, sir.

836 Q. What, in your judgment, would be the injury to the Backus property, 238 feet front, with the Michigan Central railroad running by the rear of it, or the northwest rear of it, with

13 or 14 tracks, and having its egress for business, now upon River street, upon Woodbridge street?

Mr. Baker: I object to that question, on the ground that the model submitted is not correct, and the statement of facts is not justified by anything that has appeared in the case, and I take an exception.

Mr. Dickinson: And the points I have called your attention to in the model are those to which you will confine your attention to, and they are substantially as I have stated.

A. I would call it confiscation of a big part of the Backus prop-

ertv.

Q. Suppose you owned the Backus property, with the mill upon it just as it is, what would you take to let the railroad run by there in this shape, occupying River street as it is proposed with this structure?

Mr. Baker: I object to that question on the ground that it is not a competent question what he would take.

Mr. Dickinson: That is true; it is not competent to say what he would take; but what would be the injury to the property, in your opinion, Mr. Henkel?

Mr. Baker: The same objection to that question as I made to the other one.

A. It is hard to value a man's property; it may be worth double the amount to Mr. Backus' business or to Mr. Backus himself than what it would if you were to put it on the market.

Q. You can give it in proportion, without naming dollars and

cents?

837 A. I would say more than half of it; the property would

be destroyed for his purpose.

Q. Outside of manufacturing business immediately connected with railroading, like railroad shops and that sort of thing, do you think that any manufacturing business would want to occupy a place so situated?

A. Not very well; no, sir.

Q. Would it be salable, in your opinion, for manufacturing purposes outside of railroad business or business connected with railroads?

A. I think it would not.

Cross-examination by Mr. BAKER:

Q. Did you ever have any experience in running a planing mill and box factory?

A. No, sir; I was never in the business.

Q. Have you ever been in the Backus mill?

A. Yes, sir.

Q. Been through it?

A. Many a time.

Q. Do you live in that vicinity?

A. Yes, sir.

O. How do you understand that this elevated road is to be constructed?

A. I understand that it covers nearly all the roadway, as Mr.

Dickinson stated.

O. How does it cover it?

A. The width of it nearly covers all the road, as Mr. Dickinson stated.

Q. What does it cover it with? A. With the railway.

Q. How will that be constructed?

A. I have no doubt but what there will be a good many 838 supports under it, and a railway with many ties will certainly darken the roadway and darken everything that is near it in the vicinity.

Q. You have been under the elevated roads in New York?

A. Yes, sir, many times. I call that a confiscation of all the property where it runs along in New York city; it is nothing else but a confiscation of all the property that runs there.

Mr. Dickinson: You have got to the point that the New York

court of appeals got to finally.

Mr. BAKER: In your opinion, the Sixth Avenue elevated road confiscated the property on each side?

A. Yes, sir, it is nothing else than a confiscation of that property. Q. It was not of any use to the property-owners after the road was built?

A. I would not say that it was not of any use at all.

Q. Don't you know that it increases the value of the property on

Sixth avenue in New York?

A. I would like to know where property has not increased in New York city? Just tell me one spot; even at the slaughterhouses it has increased.

Q. You testify that that was a confiscation of the property—do you mean by that that it destroyed the property for practical pur-

poses?

A. Yes, sir, in my opinion it is so; it is a confiscation of that

property.

Q. Suppose as a matter of fact it increased the value and increased the rental value of the property, then it would not be a

confiscation, would it?

839 A. I would still call it a confiscation, yes, sir, right there; if I had property there I would call it a confiscation of my property.

Q. Although it increased your rental and increased the value of

the property, you would call it a confiscation?

A. I would call it a confiscation still; even a telegraph post is a confiscation of the property where the telegraph post, even a lantern post, that is not used-

Mr. Dickinson: The Supreme Court of the United States agrees

with you on the telegraph post.

A. It is just as much a confiscation as the railway.

Mr. Dickinson: To that extent.

Mr. Baker: Do you know how large these posts are?

A. They have got to be large enough to support the railway and the traffic on it; they may be a foot in diameter; I never built a railway, I don't know about that.

Q. But you are giving testimony here as an expert as to the amount of damage this will do. Did you ever own a piece of property alongside of an elevated road?

A. No, sir.

Q. Did you ever have control of a piece of property alongside of an elevated road?

A. No, sir.

Q. You have had no experience in the practical, actual physical effects of an elevated road on the adjoining property?

A. Except what I have seen.

Q. What have you seen in New York? A. What I have seen in London and New York, both places.

Q. So that is all you know about it?

A. That is all I know about it; and besides what people have told me that owned the property along the road. 840

Q. You know that teams can come right under these elevated roads?

A. In New York city, yes, sir.

Q. You know that that is the way this is to be constructed?

A. Well, it shows here (model) that the teams have to climb up here on this bridge, in front of Backus' property, the teams have to climb up.

Q. Do you know where they are going to climb up, on which

side it is?

A. Yes, sir.

Q. Whereabouts?

A. The Michigan Central side.

Q. Partly on the Michigan Central property, is it not, and out of the street?

A. Probably it might be.

Q. Don't you know that the River Street roadway is going to be left entirely open just as it is now?

A. I don't understand it so, because the railway is going to

cover it.

Q. But it will be 14 feet in the clear?

A. Probably that might be the case; I have no doubt of it.

Q. And you think that would damage the property one-half of its value?

A. Yes, sir.

Q. In your opinion?

A. Yes, sir; that is, if I owned it I would consider it depreciated one-half of its value.

Q. You are a little prejudiced against elevated roads, aren't you; you don't like them very well?

A. No more than against any other private property.

Q. Do you carry on any manufacturing business?

A. Yes, sir, we have a flouring mill here.
Q. And you have a pork-packing institution?

A. Yes, sir.

Q. Do you own property in New York or Philadelphia, or any place where they have an elevated road?

A. No, sir.

Q. And you have been a neighbor and acquaintance of Mr. Backus a long time, I suppose—a friend of his?

A. No more than to you.

Q. But it is as much as that; are you as much a friend to Mr. Backus as you are to me?

A. I presume I am.

Mr. Dickinson: The other case, so far as it pertains to this record, I will read from Mr. Backus' cross-examination of the testimony of Peter Henkel, page 439 of the Kidder case, which is as follows:

Mr. BAKER: You are quite antagonistic to the railroads, are you not; that is, you do not like a railroad company very well?

A. Mr. Baker, as a business man I think you ought to think

better of me than that.

Q. I just ask you that.
A. I wish I could run railroads into every line of the compass in this city here; I would not care if it was a hundred of them; I would rather see it; the more the better, and it — just what we want, more railways. I am sorry that I have been subpensed in these cases, but I had to come; if I did not come somebody would be after me, and as long as I am here I am bound to tell the truth as much as I know it.

Q. There is no doubt about that, and no doubt but what you try

to do it.

A. No matter whom it hurts or whom it hits.

Q. But when you express an opinion, you would not do that with the same degree of confidence that you would of fact that you know more about?

A. This young man (pointing), I saw him the first time in my life this morning; never knew him; if he hadn't introduced himself to me I would not know anything about him.

Mr. Dickinson: You never met him until after you were sub-

pænaed, did you?

A. I never met him until this morning that I know of.

Q. A subpæna was served on you first before you met him?

A. Yes, sir.

Mr. Baker: Take this state of facts: Suppose there are a large number of mills throughout the United States that are right alongside of railroads and railroad tracks, and successfully operated. If that was so, if you operated a mill in that way and found the railroads did not interfere with it seriously at all, you would not express the opinion that you have here, would you?

843

A. In my opinion, I think that it is a failure every time when they build mills too close to railroads.

Q. You think it is a failure?

A. Yes, sir; a failure every time, and not only do I think so, but often I spoke to millers, and they told me the same thing.

Q. What miller ever told you that?

A. Well, as long as I am in the business, I have been talking to so many millers that I could hardly tell you. Q. Who have you talked with that had a mill alongside a

railroad?

A. I have not got my book-keeping in my head.

Q. If you don't recollect, say so. I simply ask you what miller you have talked with?

A. I think there are several millers near Ann Arbor who spoke

to me in that shape.

Q. Give me their names?

A. I could not give you their names.

Q. Do you know the Perrien mills in this city? A. Yes, sir.

Q. Or the Sowden; is that alongside of the railroad? There is one mill on Gratiot avenue alongside of the Milwaukee crossing; who owned it?

A. I think they used to make flour called the Mayflower.

Q. Who owned the mill?

A. I forget his name. A JURYMAN: Sowden?

A. Yes, Sowden; I met him every day, but I am getting too old to keep all those names in my head.

Q. How close do the railroads run to the mills in Ann Arbor?

A. I don't know; I haven't seen them.

Q. You have not been in Ann Arbor recently? A. Not for ten years.

Q. You have seen the elevated roads in New York, have you not?

A. Yes, sir.

Q. You think that when an elevated road is built along the street there, it confiscates the property?

A. Yes, sir.

Q. And you think that when a railroad is built in front of property, in front of the Union mills, it confiscates the property? 844

A. Yes, sir. The last time you asked me about the Sixth avenue-of course on Sixth avenue it has not the effect it has on Greenwich street, in New York. Just look at Greenwich street in New York and there you see the effect, where business men have to have artificial light all day, from morning till night, and then they cannot do any business.

Q. How wide is Greenwich street?

A. Greenwich street is about the size of this street here, may be 40 or 50 feet wide.

Q. Do you mean to say that they do not do any business on Greenwich street?

A. They do business, certainly, but how do they do it? I have

spoken to lots of men who were sickly all the time, and had to go away somewhere to be cured up again.

Q. That is because they were obstructed in light?

A. Of course, on Sixth avenue it is wider and it has a different effect there than on Greenwich street. Every merchant and property-owner on Greenwich street says it is nothing but confiscation of property.

Q. How long is it since you were there on Greenwich street?

- A. Last fall.
- Q. You get your ideas, I suppose, entirely from Greenwich street; that is what makes you think it is confiscation?

A. Yes, sir; even go on Pearl street, it is the same way.

Q. That is based principally upon the effect upon the light, is it not?

A. Not only that.

Q. What else do you refer to besides its being dark there so they have to burn gas?

A. Certainly it covers up their light; yes, sir.

845 Q. That is all there is to it?

A. No, sir.

Q. What else is there to it?

- A. It is the effect of the noise. It makes people almost crazy, they tell me, in their heads, the constant effect of the rolling backward and forward.
 - Q. Who told you that there?
 A. Several business men there.
 - Q. Did they act crazy when you saw them?

A. They say it brings the effect of it.

Q. How many men did you see there who were crazy through it?

A. I have not seen any, but they told me so. I have not seen any who were crazy.

Q. Suppose you were a younger man and you were starting out to build a flouring mill, or to equip one, would you not go and locate right alongside of a railroad, so that you could have side tracks?

A. I would, but at a bigger distance than this is from it. Q. But you would get near a railroad, would you not?

A. I would get as close to railroad facilities as possible, that is,

without getting their smoke and soot and so on.

Q. But would it not be a good plan to locate a flouring mill right in the forks of a railroad, right in the junction, right between two railroads?

A. If you had room enough to be away from catching the smoke

and cinders and so on.

Q. In your opinion, would it prevent you from locating a mill because a railroad ran right alongside of you?

A. Well, if it would run as close as this here, it would.

Q. Suppose it ran as close as 30 feet?

A. I never would locate it there, not so close as that; there is a great risk of fire there also.

Q. And you testify that on your knowledge of the business?

A. Yes, sir.

Q. As an experienced millman?

A. I am not an expert in the milling business.

Q. I suppose you know all about the business; are you not a practical miller?

A. No. sir.

Mr. Baker: I propose to read a part of the cross-examination.

Q. You never owned a mill that was adjacent to a railroad?

A. No, sir.

Q. The nearest you ever came to anything of the kind is the steamboats on the river?

A. Yes, sir.

Q. You don't have any side track at your mill?

A. No, sir.

Q. How far is the Milwaukee yard from your mill?

- A. Where the locomotives stop, that must be nearly 1,000 feet.
- Q. Are there any large manufacturing institutions in the vicinity of your mill?

A. Yes, sir.

Q. And a good many smokestacks around there?

A. Yes, sir; but they are high enough to reach above.

Q. But there is a good deal of cinders, in any of the lower portions of the city here, cinders and smoke that are in the air, is there not?

A. From those factories, the chimneys are generally high enough.

Q. I know, but it falls down and blows around just the 847 same?

A. Oh, yes, we have got to be careful somewhat.

Q. When the wind is right, you close the windows? A. Well, we cannot close them all; we have to close them on that side where they come sometimes.

Q. That is when it blows from one side, you can leave the other side open I suppose?

A. Yes, sir.

Q. And you get along the best way you can?

A. Yes, sir.

Q. But it is a great deal of annoyance?

A. Yes, sir.

Q. But you never have concluded to abandon the mill business there yet?

A. No, sir.

Q. You are staying there? A. Not on that account.

Q. You are doing a successful business in the Commercial mills?

A. I think if those chimneys were as low as the locomotives will run here, it would be different.

Q. Are you doing a successful business where you are?

A. So far; yes, sir.

Q. Can you manufacture flour of the first quality?

A. Yes, sir.

Q. And do do it?

A. Yes, sir.

Q. For how many years have you done it?

A. For a great many years; something like 12 years or more.

Q. This is a mere opinion on your part, is it not; the milling business could not be carried on successfully; you 848 would not be sure that was the exact truth in regard to it, would you; it is merely your judgment?

A. I am very sure of one thing, if a track like this (pointing to the model), with locomotives passing every few minutes, running as low as that, close to our mill, we would have to give up the business; that I am positive of, because the smoke would go right into the windows.

Q. Suppose the windows are kept closed?

A. Well, if the windows are kept closed, you cannot do that always, you have to have fresh, good air in the mill.

Q. But suppose all the windows right adjacent to the street, there

where the purifiers were, were kept closed?

A. But in a case of this kind, the smoke would blow all around the mill, where the track and locomotive is so low; but if you had high chimneys, it would be different; the smoke would blow off.

Again I read from page 450:

- Q. You have testified in almost every case that the old depot company have ever had, have you not; in all those cases down there, in 1882, you testified, didn't you, in the old condemnation cases?
 - A. Only in two that I know of.

Q. What two are they?

A. That of Bigley and Parker, I believe.

Q. And Backus?

A. No, sir; in Parker's, I was on the jury; what was the other pork-packer?

Q. Belknap.

- A. Belknap & Drake, I think in that case, and in Bigley's
- 849 Q. You testified in five cases, and were on the jury in one? A. I testified only in two cases.

Q. Didn't you testify in the Backus case?

A. I could not remember.

Q. There was not any case of Belknap & Drake, was there?

A. I could not say, it is impossible for me to remember everything; it may be in the Backus case, instead of Belknap & Drake's; I am not positive.

E. L. Thompson, sworn for respondents.

Examined by Mr. Dickinson:

Q. Where do you live?

A. In Detroit.

Q. How long have — lived here?

A. Nine years.

Q. Where did you come from here?

A. From Lapeer, Michigan.

Q. How long have you lived in the State?

A. Twenty-five years.

Q. What is your business?

A. Lumber.

Q. In what branch of the lumber business are you engaged? A. I have prosecuted it in all its branches, from the forest to the

finished article.

Q. What part of the business are you engaged in in this city? A. In the distribution and dressing and manufacturing of lumber in various forms.

Q. Have you a planing mill? 850

A. Yes, sir.

Q. Where is it situated? A. On the River Rouge.

Q. You are engaged also in the sawing business somewhere else? A. Yes, sir.

Q. Whereabouts is your planing mill on the Rouge?

A. Immediately west of the village of Delray on the north branch of the Rouge.

Q. What sort of business do you do in that planing mill; what

do you make?

A. Almost all commodities, fine lumber, sash and doors and boxes and dressed lumber of all kinds.

Q. How far is it from a railroad?

A. It is on a spur of the Canada Southern division of the Michigan Central?

Q. You have a track in there?

A. Yes, sir.

Q. How far from the main line? A. Perhaps a third of a mile.

Q. You mean by a spur you have a side track in there for freight to serve you?

A. Yes, sir.

Q. I suppose on the spur they do not trundle through as they do on trunk lines, with engines and locomotives?

A. They switch past us to the paper mills, the Sulphite Fibre Company and to the Seaton Manufacturing Company?

Q. Do you know Mr. Backus' mill?

A. Yes, sir.

Q. Do you know its situation?

A. In a general way. I am not familiar with it as to de-851 tails.

Q. You have been inside of it, have you not?

A. Yes, sir.

Q. What do you say as to its character as a planing mill?

A. I should think it is quite well constructed and a substantial establishment.

Q. A very large capacity?

497

A. I should think so.

Q. Does some other work besides yours, in hardwood?

A. I am not familiar with that; I have understood they do.

Q. Do you know its situation relative to the Michigan Central side track?

A. I have seen them in passing there, and also from being in the yard.

Q. Do you know its relative situation as to River street?

A. In a general way.

Q. You know its situation in the rear?

A. Yes, sir.

Q. What have you to say as to the need of light in a planing mill?

A. It is very essential.

Q. Why?

A. I do not know that I could enlarge on that, only in a general way. It facilitates the prosecution of the work.

Q. You have to have light?

A. Yes, sir.

Q. In doing fine work in a planing mill, how about the need of having a clean mill and clean raw material?

A. It is essential.

Q. Is the machinery fine, edges fine?

A. The edges should be to do good work. Q. Does grit affect it?

A. Yes, sir.

852

Q. Cinders and that sort of thing?

A. When it comes in contact with the knives.

Q. I suppose there is pretty large competition in the planing-mill business.

A. I think so.

Q. I suppose that in the course of the manufacture of this fine work, if it becomes discolored or scratched, while it will serve its place, does it affect its salable character?

A. If it were spoiled in the dressing it would be unsalable as

finished material.

Q. Would discoloration injure the salable character of it?

A. It would.

Q. Could you sell first-class material if it were made first-class material; if it were discolored or scratched or marked by soot and cinders, could you sell it as first class?

A. The discoloration would not exist after it has been passed through the machine unless it were exposed to the drippings.

Q. I mean if it is exposed in any way, and becomes discolored, would it affect its salable character?

A. It would not be roughened necessarily by the falling of the dirt

Q. But the point is this, whether it must not be clean and smooth in order to be salable as first-class material?

A. Yes, sir.

Q. If it is not, if it does not have the proper appearance, it destroys its sale, does it not, as first-class material?

A. Certainly.

Q. Is there a part of the system in a planing mill, to handle the business, in the making of this fine material, is it a part of the business and system to keep things clean?

A. It is very essential.

Q. That is a part of the system, is it not?

A. Yes, sir.

Q. Do you know what the character of the dust formed from a planing mill is? What is the character as to its inflammability?

A. The fine dust is explosive.

Q. Almost like powder, is it not?

A. Yes, sir.

Q. This dust, even where there is a dust-room, does it accumulate in the mill?

A. If it is allowed to it will.

Q. It floats upwards into the dust-room?

A. It is carried off by an exhaust fan.

Q. But it is in the air before it gets into your exhaust fan?

A. There is some floats back in the place, but if the machines are properly operated it is usually taken away entirely.

Q. Is it a part of the business to keep the rooms, rafters and

buildings clear of this dust?

A. They should be swept down once a week.

Q. Is it permitted to carry an open light or smoke an open pipe in a planing mill?

A. It is not in ours.

Q. What do you say as to the business?

A. I would regard it as a very hazardous thing to do.

Q. Because of the particles of dust?

A. Yes, sir.

Q. And to do that in any part of the mill?

854 A. Yes, sir.

Q. In working up the finer ornamental material in a planing mill do you have it dry?

A. Yes, sir.

Q. Is it put in a dryer first?

A. Yes, sir.

Q. Then it is all carefully dried and seasoned before the fine work is put under the knives?

A. Yes, sir.

Q. It is very inflammable after drying, is it not?

A. It would burn more readily.

Q. Have you looked at this model, the relative situation of the elevated structure here on this model to the buildings, as shown, and examined it?

A. Not carefully, but generally.

Q. I will put to you this question. Knowing the situation as you do and knowing the situation in reference to the Michigan Central, it is proposed to build an elevated railroad along River street, in

front of the Backus property, the structure for it spanning the street from curb to curb and going within six or seven feet of Backus' front line, less than six feet, with the sidewalk; upon this elevated structure, it is proposed to put three tracks, on this front. The structure itself is to be 14 feet in the clear, from the present roadway up to the under side of the structure. Over this structure is to be run trains, the passenger cars and freight cars, to the union depot, which is to be on the corner of Fort and Third streets, and the union depot is to accommodate the passenger trains that are desiring to come, and for the present the passenger trains of the Canadian Pacific, the Flint & Pere Mar-

quette, the Detroit, Lansing & Northern, and the Wabash, and also to pass over these tracks are to be the freight cars

which do the city business, what is called the package business, that is the freight that is brought to Detroit and the freight that is sent out from Detroit by jobbers, with the exception of the heavier freight, like lumber and coal. All this business is to be done for the Detroit, Lausing & Northern, and for the Flint & Pere Marquette, as freight, the top of the tracks is to be 25 feet from the roadway. There are two switches in front. The top of the track will be about even with the floor of Backus' third story. They are to run these trains, I will say, with the ordinary care with which engineers work who are instructed to be careful of railroad property in entering depots, are run at this distance from the building, and they approach the Backus property from the main trunk line at a grade of 52½ feet to the mile. What have you to say as to what the effect will be upon the Backus property and the planingmill business in that situation?

A. I should regard it as decidedly an injurious effect. Do you say it is 14 feet, the under side of the structure; is the section of

the truss ten feet deep?

Q. It is nine feet deep.

A. Is that solid or lattice like the model?

Q. Like the model, 14 feet in the clear in front of the Backus property substantially like the model. Then beyond that, on the south side of the street, in addition to the structure, and adjoining it, there is to be built a superstructure for trams, which of course will be a closed roadway over which teams may pass, on the other side of the street opposite the Backus property, and beyond the railroad structure, 24 feet wide?

A. That would be outside of River street entirely?

Q. Entirely, it would take in the sidewalk and take in a portion of the Michigan Central yard. The ends of this structure, the approach to this structure are above and below Backus' place, so that the structure is a solid roadway beyond and joining the elevated railroad structure?

A. Where it comes to a grade on River street is west of Mr.

Backus' place?

Q. Far away from Backus' place. Now how would that, in your opinion, affect the business?

A. I should think that the passing and repassing of trains would

be a great annoyance, besides the dropping of grease and cinders

from ash-pans and other things through the structure.

Q. You understand, do you not, that Backus' mill is to be supplied through trunk gates with the raw material for use in the mill on River street, and under this structure?

A. Yes, sir.

Q. How would it affect the light?

A. I think it would obstruct it seriously.

Q. What have you to say as to the danger from fire from this proximity to the planing mill?

A. It would increase the hazard.

Q. What have you to say as to the effect of steam?

A. It would be very objectionable if there were open windows. I don't know that it would penetrate the planing mill, being so much lower down. It would affect the upper stories of their factory.

Q. Would it affect the light?

A. It would affect the light, certainly.

Q. You want a steady light in a planing mill, not a flickering light?

A. Yes, sir.

857 Q. How about the darkening or the flickering of the light from the passing of trains?

A. It would have an injurious effect.

- Q. How about the effect of cinders from a train, even if they were not on fire, getting into the mill; into the mill or onto the mill?
- A. It would involve additional work as well as impair the efficiency of the machinery and the profit of the work accomplished.

Q. The dropping of the oil and grease and cinders and soot on the lumber would affect it?

A. The cinders and soot would be the principal injury.

Q. You are disinterested in this matter?

A. I hope so.

- Q. From your knowledge of the planing-mill business, do you think a planing-mill man would locate in that business with that structure?
- A. I should not, unless most extraordinary inducements were offered of some kinds that I do not see existing there.

Q. Do you think that planing mill would be salable to a planingmill man in that situation?

A. I do not.

Q. Have you any doubt about it, from your knowledge of the business, with the requirements and needs?

A. I should not have for myself. I could not speak of what another might judge.

Q. Do you have to have the lumber surveyed also?

A. After planing, do you mean?

Q. Before it comes in, as to quality?
A. We usually survey it after dressing.

Q. When it goes into the cars it is necessary to have it inspected?

858 A. Yes, sir.

Mr. TRAUB: What would be the relative value of the mill: what would be your estimate of the value of the plant?

A. I could not give an intelligent opinion as to that.

Mr. Dickinson: What do you think the affect would be on its salable character, and the effect on the value, whatever it iswhether it is \$100,000 or \$50,000?

A. In other words, how much would it depreciate?

Q. Yes; give it by percentage.

A. I should say that it would depreciate 50 per cent.

Cross-examination by Mr. Baker:

Q. How long were you in business at Lapeer?

A. About 15 years.

Q. Did you learn the lumber business there?

A. Yes, sir.

Q. Were you born and brought up there?

A. No, I was there from my majority. 'I was raised in Vassar.

Q. What was your business in Lapeer? A. Lumber.

Q. What branch of the business? A. From the tree to the consumer.

Q. Did you have a planing mill in Lapeer?

A. At Five Lakes, north of Lapeer—a saw-mill and shingle mill.

Q. Was there a town there?

A. Simply a mill village.

Q. What did you manufacture in the planing mill there?

A. We manufactured flooring and siding, and finished 859 lumber and everything up to sash and doors. We did not make those; we made mouldings and casings.

Q. Where did you sell your products?

A. From the Mississippi river to the Atlantic ocean, I should say.

Q. How did you ship it, by rail?

A. Yes, sir.

Q. No navigable stream?

A. No; an interior mill—railroad mill.

Q. Your experience was in the country where there was no navigable stream?

A. In that instance.

Q. So that the logs and lumber had to be handled, and the products, as you manufactured them, had to be shipped by rail?

A. Yes, sir.

Q. You were not in the business before the railroad was built?

A. No, we built a railroad to reach the place.

Q. Where did that railroad run from?

A. Fish Lake.

Q. Operated as a railroad?

- A. Yes, sir; operated by the Michigan Central, or rather the Detroit & Bay City, at that time.
 - Q. I suppose you still manufacture lumber there.

A. No, sir.

Q. The logs have all been used up?

A. Ten years ago nearly.

Q. When did you come to Detroit? A. I came to Detroit in March, 1882.

Q. Was Mr. Backus running a planing mill here then?

A. Yes, sir.
Q. Did you build a new planing mill, or buy an old one? 860 A. We built a new one when we built; but we did not build until 1884.

Q. What did you first do here?

A. I simply made this my residence, and I sold our products in Chicago; had a yard there.

Q. You continued your Lapeer business?
A. No; we continued our new business in the upper peninsula; we had a mill there.

Q. You had no business here?A. No business here, except my residence here for two years.

Q. In 1884 you located a planing mill and built one?

A. Yes, sir.
Q. What else did you locate on the Rouge?

- A. Our storage yard for receiving and piling the product of our mill.
 - Q. Have you a lumber yard there?

A. Yes, sir.

Q. Is it located on the navigable part of the Rouge?

A. Yes, sir.

Q. So that you can load vessels there?

A. Yes, sir.

Q. Is that the Delta Lumber Company?

A. Yes, sir.

Q. How large a yard have you?

A. About 14 acres.

Q. How many million feet of lumber have you in the yard now? A. We have nine million in stock, and I think about a million

and a half is at the Gratiot Avenue yard.

Q. How far are you from the Michigan Central line?

861 A. About a third of a mile.

Q. Who built the side track into your place?

A. The Michigan Central.

Q. At your request?

- A. Yes, sir.
- Q. Was it there when you located there?

A. No, sir.

Q. Have any manufacturing institutions been built up beyond you since?

A. The Sulphite Fibre Company and the Sutton Manufacturing Company, both.

Q. Did the Michigan Central extend the side track into them?

A. Yes, sir.

Q. So there are two large manufacturing institutions beyond you on that side track?

A. Not on that side track; they turn off on our premises and go to the westward.

O. That side track goes into your yard, and they have a branch beyond going to theirs?

A. Yes, sir.

Q. How many cars do those other institutions have in a day?

A. I am not able to answer that question.

Q. A number every day?

A. Yes, sir.

Q. How many cars do you receive there daily?

A. We receive very few; we ship away; ours is nearly all brought in by vessel.

Q. What proportion of your lumber is brought by rail?

A. Two or three per cent., perhaps.

Q. How is it in the winter time?

A. We take in a stock in the fall to last us. We are sup-862 posed to do so at least.

Q. But do you take in some by cars? .

A. Yes, sir. Q. Where does it come from?

A. Various points in Michigan and elsewhere.

Q. Have you a place on the navigable water where you receive your lumber?

A. Yes, sir.

Q. And that is where you get your stock from?

A. Yes, sir.

Q. I suppose at the present time, the lumber that is manufactured upon navigable water is somewhat limited, is it not; you have to go back further for it than formerly?

A. Have to go further back for the logs.

Q. Is there not a large amount of lumber in this State that it is necessary to handle by rail? A. There is less of it now than four or five years ago.

Q. There is considerable of it yet?

A. Somewhat.

Q. Is it customary to manufacture lumber in the interior and to carry it on cars to navigable water, then load it into vessels and take it to manufacturing points?

A. That is practiced, but I think there are more than three times as many logs drawn to navigable waters as manufactured lumber.

Q. Take lumber manufactured in the upper part of the lower peninsula, if it is once loaded on cars, would it be economical to take it to Chicago without loading it on vessels?

A. It would go directly to its destination if it were loaded on

cars.

863 Q. Suppose that you are engaged in the lumbering business in the central part of Michigan, and you have lumber bound to Detroit, where it is going to be manufactured, in your mill or in Backus'; you would bring it down in cars, being once loaded, and not take it to Saginaw and ship it?

A. We would bring it down by cars.

Q. What proportion of your output goes away in vessels?

A. There is not really any of it, except a few scow-loads go to the Pointe or to the flats.

Q. Where do you sell your products principally?A. From the western line of Illinois to Maine.

Q. You do not go west of Illinois?

A. We do not go west of the Mississippi river.

Q. From the Mississippi river to Maine you cover the entire country?

A. We sell in all that country; we do not cover it all.

Q. About how many million feet of lumber do you manufacture into products in your mill annually?

A. Twenty-two or twenty-three million feet.

Q. You manufacture that lumber into what sort of products? A. I understood your question to allude to the saw-mill.

Q. No, I am talking about the planing mill.

A. Our planing mill would handle about 60 per cent. of that The balance would be lumber sold in the rough. product.

Q. About how many million feet of lumber do you take into your yard annually?

A. From 24 to 26 million.

Q. You put out how many million?

A. The same as we take in. Q. You either send it out as lumber or manufacture it into 864 a manufactured product of some kind?

A. Yes, sir.

Q. What are those products, what do they consist of?

A. We make doors, we do not make blinds-doors and sash and casings and mouldings and ceilings and flooring and finishing of all sorts, and decorative shingles, etc.

Q. Have you a large local trade in Detroit?

A. We have a fairly good local trade.

Q. Detroit could not consume a fifth part of your product?

A. Probably 20 or 25 per cent.

Q. Is a quarter of your product sold in Detroit?

A. Yes, sir.

Q. Is it used here?

A. Yes, sir.

Q. Would it be practicable to carry on your business down there, carry it on successfully without railroad facilities?

A. It would not.

Q. And you use those facilities principally in shipping your products?

A. Yes, sir.

Q. In shipping things of this kind to Maine, New York, and so on, would it be practical to load them into vessels and take the lumber part of the way and then go on by cars, would it be economical?

A. It would not be economical.

Q. You have your mill there to make finished products of some kind?

A. Yes, sir.

Q. It would not be economical to undertake to ship it by vessel, would it, unless it was bound for some lake port?

865 A. No, it would not.

Q. If it was to be used in the interior of the State of New York, you would not ship it by vessel to Buffalo and by rail to destination, would you?

A. If the lake vessel could go through the canal?

Q. I sav off from the canal?

Mr. CHAREST: Can't we save time and leave the canals alone. There are a great many questions that I don't see what you are

driving at.

Mr. BAKER: Perhaps some of the other jurors can. I think I will examine the witness and find out some of the facts that I want to rely upon. What I am trying to show - that it is impossible for Mr. Backus to do this business without using the railroad, and that the railroads are of more use to him than injury, and this very road would be.

Mr. Chipman: Why don't you ask him if he has got all the railroad facilities he wants already; whether he would like to have

more come there?

Mr. Baker: I have established already by this witness that Mr. Backus has not got all he wants, if you will pay attention to the facts that he has testified to.

Mr. CHIPMAN: I have not heard any such testimony.

Mr. Baker: Simply because you do not want to hear it; you do not want to understand it.

Mr. CHIPMAN: We will see when we get to the jury.

Mr. Baker: That is just where we will see.

Q. In your yard I suppose you pile the lumber from the vessel into the yard?

A. Yes, sir.

Q. And then you use it daily by taking it to the mill?

A. As required.

Q. How do you take it to the mill?

866 A. On trucks.

Q. You have tramways?

- A. No, plankways laid on the ground, and we use a two-wheel truck.
 - Q. Without horses?
 A. With one horse.

Q. Is it a tramway?

A. It is not a tramway—an elevated passage.

Q. It is not necessarily elevated, is it? A. With your definition, it is a tramway.

Q. What I want to get at is, do you haul it on an ordinary truck such as runs in the street?

A. No, sir.

Q. You have tramways that run on the surface of the ground?

A. Yes, sir. 64 - 55 Q. But they have wooden rails?

A. No, no rails on them.

Q. Describe it.

A. It is simply a plank road, and we use a two-wheel vehicle that we put about 1,200 feet of lumber on, and we have a pair of shafts to which the horse is attached. They call this the morman, and he catches onto the trucks and draws them to the mill.

Q. How many horses do you use at that work?

A. We use two horses for supplying the mill.

Q. Do two horses do the work?

A. They haul what is drawn into the mill. Q. Most of your lumber goes into the mill?

A. 50 or 60 per cent. of it. It is a two-wheel truck, a cart with a frame on it.

Q. How deep are the wheels?
A. Three feet high.

A. Three feet high.
Q. A broad wheel?

A. Four-inch tires.

Q. And these trucks hold about 1,200 feet?

A. Yes, sir.

Q. And you haul 50 per cent. of the lumber in your yard into the mill with those trucks with those horses?

A. Yes, sir. You understand those trucks are not unloaded. They are drawn in there and the load is left upon them until it is run through the planer. We have 150 of those trucks.

Q. How do you load the cars?

A. After the lumber is dressed it is put on these same trucks as it comes from the machine, and it is carried to the car door, wherever the car may stand along in the shed.

Q. How close do the cars stand to the mill?A. They run through the edge of the mill.Q. So that they are covered by the roof?

A. Yes, sir.

Q. Is that an economical way of handling the lumber and the products?

A. We regard it as so.

Q. And you do all that with two horses?

A. After the lumber leaves the planer we do not use the horse. We haul all the lumber into the mill with two horses.

Q. When you haul the trucks to the car door, you do it by hand?

A. Yes, sir; it is on a level, smooth floor.

Q. How high are the wheels?

A. The same trucks.

Q. Is 1,200 feet about the capacity of that?

A. No, they will carry a great deal more than that, but they are too heavy to handle.

Q. You can handle them conveniently with about 1,000 or 1,200 feet?

A. Yes, sir.

Q. You have a large engine there, I suppose, and a boiler and a dust-room?

A. We have a shavings-room.

Q. What kind of a dust-arrester have you?

A. One known as the Allington, made at Bay City or Saginawa centrifugal machine.

Q. How is that constructed?

A. The shavings and dust and all the air coming from the exhaust pan goes into the side. It is on a scroll, and as it is thrown around on the inside it escapes out of the top; the dust and shavings pass through the pipes into the shavings vault.

Q. Do you use a great long apparatus covered with burlap?

A. No. sir.

Q. Did you ever use any such thing?

A. No, sir.

Q. Is this dust-arrester of yours a good practical machine?

A. It does our work with entire success.

Q. How do you take the dust from the machine?

A. It is taken out near the top with a small pipe, six inches in diameter.

Q. One on each machine?

A. We take it up into conductors into a main trunk line.

Q. How do you force it through the conductors?

A. By an exhaust fan.

Q. How many conductors in the room where you work?

A. Our planing mill is all one room.

Q. How many stories high is your planing mill?

A. One.

869

Q. You have over each machine a pipe by which you can conduct the dust to this dust-arrester?

A. The dust includes the shavings, and they go into a conductor, a conveyor, that carries it to the shavings vault.

Q. Where is the dust-arrester located? A. On top of the shavings vault.

Q. How far from this main room where you have all your machines?

A. One hundred feet, say.

Q. You carry it through a long pipe?

A. Yes, sir.

Q. What is the diameter of that pipe?

A. 26 by 30 inches square.

Q. This is a metal dust-arrester?

A. Yes, sir.

Q. How large is it in diameter?

A. Probably 16 feet across.

Q. Is that all?

A. At the largest part, and there is another part above it not so large, where the fine dust is collected.

Q. Is that round or square?

A. It is round; it is on a scroll-not a true circle, but a reducing circle.

Q. Does that distribute the shavings and the dust—what does it do to the shavings?

A. They collect the shavings in the bottom part of the device, and they pass through a pipe a foot in diameter into the shavings vault beneath, and the dust passes through the same vault, through another pipe, into the top of the dust-arrester.

Q. Is the dust-arrester inclosed; is it tight all the way 870

around it? A. Yes, sir; a large aperture at the top.

Q. Do any of the shavings go out? A. They do if it gets stopped up.

Q. But if it works the pure air goes out?

A. Yes, sir.

Q. Any smoke or anything escape from it?

A. I think I have seen a fine dust blowing out at times.

Q. But it is almost invisible?

A. It is practically so; you have to look very close to see it.

Q. How long have you used this dust-arrester? A. I am unable to say, probably four or five years.

Q. Who put it in for you?

A. The manufacturers.
Q. Where do they reside, the Allington machine? You never used one of these machines 40 or 50 feet long, and composed of spaces that are covered with burlap?

A. No, sir.

Q. So that you have no knowledge as to whether they are a proper dust-arrester or not?

A. I have not.

Q. Is this dust-arrester that you have in general use?

A. There are a large number in Michigan. I could not say that it is the largest.

Q. Are they in use in other places in this city?

A. I think they are. Q. Whereabouts?

A. I think one or two of the furniture factories, and Vinton & Company have one.

Q. Down here on the Milwaukee road?

A. Woodbridge street. 871

Q. There is a planing mill right in the junction on the Michigan Central out here at their junction with the Bay City road, is there not?

A. Yes, sir.

Q. Do you know what they use?

A. No.

Q. Do you know what they use at the Peninsular car works?

A. I do not.

Q. But you do know that there are a number of these small metal dust-arresters in use in this city?

A. Yes, sir.

Q. You have used yours four years successfully?

A. Entirely so.

Q. You say you have run a planing mill at Lapeer, or at Fish Lake, and you have run one in Detroit since 1884; I want to ask

509

you this question, whether you think a planing mill can be successfully conducted, taking the present competition that exists in the business, the struggle which almost every kind of business has to sustain, do you think a planing-mill business can be successfully conducted where the lumber yard is half a mile or more from the mill, and the entire product, the entire lumber that is fed to that mill has to be hauled by teams?

A. It would be hardly fair to answer that question.

Q. It does not make any difference whether it is fair or not. I want to know whether you think a business, considering the present situation of the business, the location of lumber and the location of the places where the product is to be sold—I want to know whether

in your judgment a planing mill can be successfully conducted where the lumber yard is a half a mile from the mill, and every foot of lumber that is taken to that mill has to be

hauled by teams?

A. It simply costs so much more to get the lumber into the mill. If it costs 50 cents to put it in from a half mile it might cost 20 cents to put it in from 50 rods, so the difference in the cost would be the difference between the longer and the shorter haul.

Q. Suppose a man could save 20 cents a thousand on every thousand feet of lumber that he manufactured, he could do a successful

business, could be not?

A. If he did not lose it somewhere else.

Q. To go back to my question, do you think that you could take the Backus mill and the yard, just as it is located, and run it in competition with your mill at Delray?

A. Where would you mean to sell the product?

Q. Sell it wherever you can.

A. If we were going to ship the product by car we could do a cheaper business; but if we were going to retail the lumber it would operate on the other side.

Q. I don't suppose the city of Detroit would use one-quarter of

the product of the planing mills in this city?

A. No, I don't think it would; I don't know that the wholesale trade of Detroit is as large as it was four or five years ago.

Q. Any one mill could produce all that is wanted here?

A. No.

Q. How many mills would it take?

A. I guess there are 100,000,000 feet of lumber used in Detroit, and I don't think any two planing mills could handle that amount of lumber.

Q. Rough and dressed?

873 A. Yes, sir.

Q. Then you concede, do you not, that any mill that is located here has to depend largely upon a trade outside of Detroit?

A. For 50 per cent. of their product, they would. Q. They depend upon shipping it elsewhere?

A. Yes, sir.

Q. As far as that trade is concerned, could the Backus mill compete with your mill?

A. I should say not, everything else being equal; they have as good railroad facilities, but we have better dock facilities.

Q. They would be losing every year all the time whatever it cost to handle the lumber between those two yards, would they not?

A. Yes, sir; we have more yard adjacent to the dock; we do not have to haul back as far.

Q. You have more frontage on the river? A. Yes, sir.

Q. You located this yard just as intelligently as possible to do a successful business?

A. I tried to.

Q. There are planing mills and box factories at Bay City?

A. Yes, sir.

Q. And at Saginaw?

- A. Yes, sir. Q. And at Chicago? A. Undoubtedly.
- Q. Have they such institutions in Toledo?
- A. I think they have. Q. And Cleveland? A. Yes, sir.
- Q. It is a business that prevails generally in this country, 874 almost every town has an institution of that kind?

A. Yes, sir.

Q. So that there is a great deal of competition in the business, nobody monopolizes it?

A. No. sir.

Q. You never formed a trust to unite all these mills?

A. I have never heard of any?

A JUROR: Had not the cost of 17 acres on the Rouge something to do with your location down there?

A. It had somewhat; we wanted lots of room. Q. If you had to buy 17 acres in the city?

A. We would not do it.

By Mr. BAKER:

Q. You have that advantage in addition then?

A. Yes, sir.

Q. Would it be advisable down there where you are, where land is cheap, to put your yard a half mile from your mill?

A. I should prefer not to do it.

Q. You compete with Mr. Backus in everything except box chutes?

A. I don't know that we compete; we are in the same line.

Q. Do you make box chutes?

A. To some extent.

Q. Do they go all over this country the same as the other products?

A. No, they mostly go to the South, towards the Ohio river. Q. Have they institutions in Chicago that make box chutes?

A. I am not able to answer that intelligently.

Q. Are you able to compete with the Chicago manufact-875 urers?

A. We have never run against them; the Bay City are the hardest people we have to meet.

Q. They are the toughest competitors you have?

A. Yes, sir.

Q. Are the planing mills in Bay City advantageously located?

A. Yes, sir.

Q. Have any of them a yard a half mile from the mill?

A. No, I guess not in that case; in one instance, Ross, Bradley &

Co. haul all their lumber into their yard from the dock.

Q. It is perfectly practicable, is it not, in running a lumber yard, to take the lumber and handle it with those trucks, if your yard is properly located?

A. Yes, sir.

Q. So as not to have a large number of teams?

A. Yes, sir.

Q. And that is the economical way of doing it?

A. Yes, sir. Q. You know Mr. Backus' yard at the foot of Eighteenth-and-ahalf street?

A. I pass it frequently.

Q. It has 400 or 500 feet frontage on the river?

A. Yes, sir.

Q. And a couple of slips that run into it?

A. Yes, sir.

876

Q. Would there be any difficulty in using these trucks? A. I don't think that there would.

Q. There is about seven acres in his yard, is there not? A. I could not say.

Q. Something like that?

A. Probably.

- Q. Mr. Dickinson put a hypothetical question to you; do you think you understand this exactly how this elevated railroad is to be built in that street?
- A. I have simply seen that portion which they have erected; I drove by it yesterday.
 - Q. You have seen that portion that is in the yard down there?

A. Yes, sir.

Q. Do you realize that the superstructure is to leave the street entirely open, as far as teams going up there is concerned, the ingress and egress will be just the same as it is now?

A. I cannot say, but I think it will be just the same.

Q. Why?

A. Because of the columns that support it.

- Q. Suppose that the columns are so placed that they do not interfere in any way, they span his gates, and the telegraph poles that are there now will come out and a smaller obstruction be put in the place, and the superstructure is higher than the timber across his gate?
 - A. That would reduce it.

Q. Can you tell us where there would be any obstruction to teams under such circumstances?

A. I don't think they will encounter any obstruction in the col-

umns if they are placed as you state.

Q. In your estimate you make it on the theory that his teams would be incommoded in some way?

A. Yes, sir.

Q. You also think his light would be affected—what do you base that on?

A. On the height and breadth of the section of this 877 structure.

Q. Do you know how far the superstructure will be from his building?

A. No. sir.

Q. Do you know that it will be between 30 and 40 feet?

A. If that is what the thing measures.

Q. You did not think it was as far as that?

A. I could not say as to that.

Q. Did you know that after that structure is erected, except a very short time early in the morning, it won't even throw a shadow on his premises?

Mr. Dickinson: We object to that statement.

Q. Did you realize that, except when the sun is very low on the horizon in the morning, that that superstructure will not even throw a shadow?

A. I never gave it any consideration, never stood on the premises

to look at it.

Q. You assume that his light is going to be seriously interfered with?

Q. If it is not to be seriously interfered with, you would change your estimate, would you not?

A. I cannot see how it is going to be otherwise.

Q. Suppose it is otherwise?

A. If it is otherwise, of course the depreciation would be less in

that regard.

Q. Do you understand that this ten feet of superstructure, as Mr. Dickinson saw fit to refer to it, is to be a solid structure, the entire width of the street?

A. I asked the question, and I understood the answer to be that the lattice-work shown on that plan was the kind to be used, but following that is the viaduct that has to be closed in. 878

Q. But the viaduct is on the other side of the street, and mostly out of the street. It was stated in the question that was put to you, that this was going to be 10 feet deep, and solid right across the street?

A. Yes, sir. Q. That is the way you understood it?

A. Not being solid. Ties were to be laid some distance apart, so that sunlight can pass through.

Q. Do you understand that the only thing that will be built in the street will be in the first place lateral girders that run from post to post across the street, and that the bottom of those girders will be 14 feet above the street level, so that there is a girder made out of plates of iron running across the street, with nothing between the girders, and longitudinally on top of those girders will be strung longitudinal girders upon which the ties will be laid?

A. What length of span?

Q. Thirty-five feet. And the ties are to be six inches apart, and while there are to be three tracks for most of the distance, there will be a space of about four feet between the tracks, so that the daylight and sunlight can go right down through, and the sides are open, so that we simply have an elevated structure that is surrounded by light. Will you just tell this jury how you think that is going to affect the light in Backus' mill?

Mr. Dickinson: You forgot to mention about the pans under the

track.

Q. I am glad you referred to that. There are pans to be crected between these longitudinal girders. Those pans and the girders will occupy between five and six feet. They are put there for the purpose of catching the drippings and the things you are so afraid of. Suppose that is there?

A. It would seem that the access to the light is limited under

those conditions.

Q. Does it appear limited?
A. It does to my mind.

Q. Can you conceive that there would be a deficiency of light in a structure that is 14 feet high and is open on the sides, and has four-feet spaces, two of them through the roof?

A. Yes, sir; I can conceive of it.

Q. Suppose you took out the sides of this building and put in posts 35 feet apart; suppose you took out the sides of it there, and this side, and put in posts 35 feet apart, and left the roof just as it is, the ceiling just as it is, and you opened two strips through the roof there four feet wide, went right through to the sky; now, do you think that when people were in the room, in that situation, there would be a deficiency of light?

A. Well, is not this higher? Q. Say it is only 14 feet high?

A. I should think there would be; the higher the structure the more freely the light would come in.

Q. But suppose the sides were taken right out and columns put

in 35 feet apart, would it have a great effect in the light?

A. It would not have a great effect on the light when the cars were off it, perhaps; the cars on there would darken it very considerably; they are far from being transparent; they would effectually close it off.

Q. But they go by in a very few seconds?

A. Ordinarily.

Q. They are only there a moment. Now do you think, as a practical planing-mill man, that such a structure, with cars run-65—55

ning over it, would ever interfere with a single workman in that mill?

A. I do.

Q. To what extent; what is it in the mill that he could not see, that he would have seen if the superstructure of the railroad was not there?

A. Let me illustrate: Suppose he was fixing a matcher to make flooring, he would have necessarily to have a fine adjustment; he is working at that, and a train comes along and he stops his work.

Q. How long would he stop?

A. I don't know how long the train takes to pass.

Q. How long would it take a train at ten miles an hour to go 238 feet?

A. Perhaps not over a couple of minutes.

Q. Do you think it would take that long? At that rate how long would it take to get to Chicago?

No answer.

JUROR: If you were obliged to change your location, and the Backus mill with the viaduct in front of it was to rent; two blocks away from there was a mill made the same as the Backus mill, to suit your business the same as the Backus mill, without the viaduct-which one would you rent?

A. The one you have last described, most certainly.

Q. Without the viaduct? A. Yes, sir.

Mr. BAKER: You think that if there was a mill there that had no railroad facilities in front of it, you would prefer it to one that had?

A. That was not the question that the juror asked.

Q. Do you assume that no use could be made of this elevated road?

A. I do.

881

Q. What do you base that on?

A. Because it is on a grade so high up. Q. What is the grade of the proposed elevated road in front of the Backus mill?

A. I am told 52 feet in a mile.

Q. You don't know what it is yourself? A. No, sir; not of my own knowledge.

Q. Do you know of any reason why an elevated side track could not be put in in front of his property on a level so that cars could stand on it?

A. No, sir; it could certainly be done with sufficient outlay.

Q. So that a side track could be put in there. Now, do you think that the way railroads are run in this country, Mr. Backus has got all the railroad facilities he wants with the Michigan Central?

A. I should think he had.

Q. What makes you think so?

A. Because he has never failed to get his goods shipped, I understand.

Q. But they have to go out under the control of the Michigan Central to the junction at least, don't they?

A. Yes, sir.

Q. Now, sometimes it is important in your business to make a quick shipment, is it not?

A. Sometimes, yes, sir.

Q. And if you have direct communication with a road -hat is going right down to the point of shipment, it is an advantage, is it not?

A. It would not be if you had to elevate your goods to the top

story.

Q. Suppose you didn't have to elevate them; suppose when you manufactured them you had simply to slide them down?

A. Then I would have the lower one even.

Q. Suppose your mill was so constructed that the product went out of the mill on a slide, would it make any difference; suppose you had the Backus mill there, three or four stories high; do you understand, or do you testify, as a practical millman, that it would make any difference to him, any practical difference, as to which floor he loaded his product on?

A. It would depend upon which floor he finished it on.

Q. But if he finishes it up a story, he can load it there just as well as to slide it down and load it there?

A. Yes, sir.

Q. So, can you see any physical difficulty in Mr. Backus using a side track alongside of this mill?

A. Let me explain; I do not think he planes his lumber in the upper part of the mill—his dressed lumber, boxes, etc., that is what he loads on cars.

Q. But his planing machines are on the first floor, are they not? Do you know that the first thing he does with his lumber is, he puts it right through those planing machines and then puts it through some rollers that he has there, and slides it to the top story of his mill?

A. I don't know that he does that. What does he do that for?

883 Q. He does it to put it in a place where he can manufacture it into box chutes.

A. My proposition is that he ships dressed lumber, that he does

not have occasion to elevate.

Q. But his product, his principal product there is largely in box chutes, and he sends a great quantity of lumber to the roof?

Mr. Dickinson: He does not testify to that.

Q. Now, a mill that is constructed in that way with these rollers that catch a board, and they keep on going back and forth there until they get in the top room; then he commences to work on it, and finally he makes it into box chutes, and they come down; now, do you think it would make much difference to him which story he loaded them into cars on?

A. As I said before, it would depend on where he finished them.

Q. He could finish where he saw fit, could he not?

A. I suppose he could, but it might not be equally convenient.

Q. It might not be quite so convenient; but do you think there would be any physical difficulty in adapting his mill to suit the situation?

A. I could not say as to that.

Q. Don't you know that it would be a great advantage to him to be enabled to ship directly over the Wabasu road to St. Louis and to Cincinnati and to Indianapolis?

A. That would depend on whether he had orders for those places

or not.

Q. Suppose he had orders?

A. It would be.

Q. It would be a great advantage, would it not?

A. I would say it would be an advantage.

Q. And suppose he was doing a hardwood business, would it not be an advantage to him to bring hardwood from the hardwood country of Indiana—northern Indiana?

A. It might facilitate the delivery of it.

Q. You know that his yard is located at Eighteenth-and-a-half street, with the Wabash road running through?

A. Yes, sir.

Q. And that that track down there is to be connected with the union depot to run on this elevated road, right in front of the Backus property?

A. Yes, sir.

Q. And it is practical to put in a side track there for his use, and have his lumber partly elevated, so that he would not have to slide it through those rollers quite as far. Do you know of any reason why he could not use that railroad instead of teams to haul all his lumber from his yard?

A. If they do the work for him for nothing.

Q. Suppose they would charge him less than it would cost to do it with teams?

Mr. Dickinson: We make an objection, and will take an exception.

Q. As Mr. Dickinson objects, I will put this question to you: Don't you know that the railroads could handle his lumber from his yard to his mill if a side track were built in like that, and could do it cheaper per thousand than it is possible to do it with teams?

A. Do you include in that the loading on the cars at the initial

point?

Q. Using the same force to load that he now uses, he could load onto the cars with trucks, as you load, could he not?

885 A. Yes, sir.

Q. There would be no trouble about that, and it could be hauled right up to two or three cars, and stood in front of his mill, and the lumber moved from the cars right onto his machine?

A. That could be done.

Q. Is it not your judgment, as a planing-mill man, and with

your knowledge of the business, that it could be done by the railroads cheaper than it is possible for Mr. Backus to do it with

teams?

A. No, sir; because every time you handle lumber you very much increase the expense; you would be obliged to handle it on the car, and off the car again. When you put it on the truck it is not handled again until it gets to the machine.

Q. It would still be more expensive than your system?

A. Yes, sir.

Q. But would it not be less expensive than his present system?

A. I would not say as to that.

Q. But even then it would be more expensive than your system, would it not?

A. It would.

Redirect examination by Mr. Dickinson:

Q. Do you think there is a railroad with three tracks—four railroads with three tracks—running over it, connecting with the union depot, doing the business of four great roads, that could make a deal that would be satisfactory to a business man, to haul all his freight for half a mile?

A. I should not expect them to.

Mr. BAKER: They do it every day.

886 Q. Haul all his freight from his lumber yard up to his mill, and fill that track up with the business as he wants it; do you think that would be practicable?

A. Shippers usually have a great deal of difficulty in getting cars

and getting switching.

Q. And you have had some experience throughout the United States with the long and short haul?

A. Yes, sir.

Q. Do you think you could make any terms with a railroad to do all your hauling for half a mile?

A. Not if they did it with a profit.

Q. If you had a switch up from Backus' lumber yard, do you think you could always get a car in when you wanted it, and not convert your planing mill into a lumber yard, using the tracks as they do?

A. In our experience, we always have to provide a day ahead at

least.

Q. As you want your lumber in a lumber yard, you know the kind you want, and you have to have a lumber yard in which to do the inspection and sorting; a lumber yard is essential?

A. Yes, sir.

Q. And that is usually done, the sorting and the inspecting and putting into piles, so that you can give an order from your mill for what you want, and it makes it necessary to have a yard for that purpose?

A. That is generally the case.

Q. And then you give an order from your mill for what you want, and then the truck goes and takes it?

A. That is the way it is usually.

Q. And then it is fed from your truck as you need it?

A. Yes, sir.

Q. Do you think it is practicable to get that business done 887 by a railroad—a railroad running in an elevated situation? A. I do not.

Q. How many of those trucks do you have at one time in the mill?

A. I would have to give a random answer to that; I could not say definitely, but it would be anywhere from 12 to 20 or 30.

Q. For use inside?

A. Yes, sir. Q. You have been asked about the difference in the cost of having his lumber mill down on the dock and this distance from his planing mill. Do you know whether it makes any difference in the insurance rate whether your lumber yard is adjacent to your planing mill?

A. I do.

Q. Which way is the insurance? A. It decreases it to have it removed.

Q. I do not want to inquire into your private business, but your lumber yard is quite adjacent to your mill, is it not?

A. One hundred feet away. Q. What rates do you pay?

A. \$2.75, 23 per cent. If we were in the city limits we would have a reduction of 25 cents.

Q. But the remoteness of the lumber yard affects the insurance rates?

A. I think \$2.25 is the minimum rate, however.

Q. In regard to your railroad facilities, in practical business, you want to sell a load of lumber, you have an order for a load of dressed lumber to ship from your mill, down on the Wabash or on the old Butler road anywhere, what do 888 vou do?

A. We usually order the car the first thing from the Wabash.

Q. They send it in over the Michigan Central track? A. Yes, sir.

Q. Can you switch by the Wabash, the Flint & Pere Marquette, the Detroit, Lansing & Northern or the Canadian Pacific, or any road that runs in Michigan, over that side track?

A. Yes, sir; for competing points they absorb the switching.

Q. To non-competing points they do not. You are not obliged to pay to competing points for switching; they are always glad to get a load from you?

A. Yes, sir.

Q. On any road?

A. Yes, sir. Q. That is the practical way the business is done?

A. Yes, sir.

- Q. Will you tell me whether you have not all the railroad facilities at your mill that you want?
 - A. Yes, sir; we have. Q. With one switch?

A. Yes, sir.

Q. Do you know that the law requires every road that comes here to give you connection?

A. Yes, sir.

Q. And it is your right to load a car there and have it go over any road that enters Detroit?

A. Yes, sir.

Q. Do you know Mr. Backus' railroad facilities?

889 A. He has the same as we, I understand, with the Michigan Central.

Q. Have you any reason to think that he has not all the railroad facilities he wants?

A. I think he has.

Q. Would you in his place require any more?'

A. I cannot see why I should.

Q. Would you require any new switching by the Wabash road at your place?

A. I would not want it if I had to give the ground for it.

Q. It is not of sufficient importance to you to have any other switch than what you have?

A. No, sir.

Q. Now, Mr. Baker thinks that Backus is kind of running his business there in a way that is not a good way—running a lumber yard that is about half a mile away from his planing mill; he thinks he could run it better for him; he thinks he could plane a great deal more, and make more money; you know the situation of his storehouse on Fort street also?

A. Yes, sir.

Q. Do you know what it costs him for a load of lumber to get up to his planing mill, with the site he has?

A. No, sir.

Q. Per thousand feet?

A. No, sir; I could not say.

Q. Do you remember what it costs you?

A. We don't figure that way. We charge the team service in the hauling of lumber from the yard as a planing-mill expense, and that includes the dressing, and I could not divide it up.

890 Q. Would it occur to you that ten cents a thousand feet would be pretty cheap transportation?

A. I should think that was cheap.

Q. You would consider it cheap if you found that was what it was costing you at your place?

A. Yes, sir.

Q. Do you think Mr. Backus' position in having his lumber yard near the center of the city for city trade, is better than it would be down at Eighteenth-and-a-half street?

A. The difference in hauling would not be material.

Q. But do you think his proximity for orders, in having his planing mill near the center of the city, is better?

A. It would be an advantage.

Q. Do you receive your lumber by water?

A. Almost entirely.

Q. And you know that Backus does, and that he requires a water front?

A. Yes, sir.

- Q. His planing mill is situated relatively about right for his business, and his whole plant, with his storehouse and his lumber yard, is it not?
- A. I think it would be better with his storehouse adjoining his mill.
- Q. Do you think it would be better with his lumber yard adjoining his mill?

A. With the ground costing as much as it does there, I would not

say so.

Q. Would there be any more risk from fire if he put his store-house near his mill?

A. No, sir.

Q. Does he not gain on his insurance for his storehouse by having it remote from his mill?

891 A. Yes, sir.

Q. What do you think would be the advantage of having the storehouse near his mill?

A. In the teaming and the maintenance of the additional office

at his storehouse.

Q. You have what is called the Cyclone dust-arrester, dust machine, and you have on your dust machine used about 15 horsepower, have you not?

A. On the fan you mean? We do not use any power on the dust-

arrester.

Q. But I mean in the exhaust.

A. The exhaust is 35 horse-power in our mill.

Q. And you find, do you not, that the dust from your dust-room comes out through those spaces to some extent; it comes upon the slats and upon the buildings outside to some extent—the fine dust?

A. It is very limited; the wind blows it away.

Q. But it does come out?

A. I presume so, but very little; although it is not visible.

Q. You don't mean to state or set up that your dust-arrester is better than the one that Backus uses?

A. No, sir.

Q. Do you know that the Backus dust arrester, the same one, is used in a number of mills in the country?

A. I have heard so.

Q. And it is said to be the best?

A. I have not heard anything said about it, except by Mr. Backus; he said it was a good one.

Q. You have examined that model?

A. Casually.

Q. Have you ever studied the law of light as a science at all?

892 A. No, sir.

Q. Do you know from your experience that as the atmosphere is, without regard to the sun being sighted, whether it is on this side of your building or on that side, do you know that the law is as to light, that as your view of the atmosphere itself is obstructed, so is your light obstructed?

A. Yes, sir.

Q. Do you find that is true?

A. Well, yes, I should say so, generally.

Q. Now, we will say if, across here, 200 feet away, that gray-stone building there, probably 200 feet away or more, should be higher, so that it would obstruct the windows, obstruct our view of the sky, below the curtains, or obstruct our view of the sky, as we look from the window, would it affect the light in this room?

A. I would not say that it would so far away; it would affect the light in the street; we have that in the Moffat building, with the

Hammond building opposite.

Q. As you look across there?

Mr. Dickinson then goes across the court-room and pulls down the curtain of the window next to the southeast corner of the room, and then asks:

Q. Can you see the building?

A. Yes, sir.

Q. Can you see the sky?

A. No, sir.

Q. Now, that is a pretty extreme test. Now, will you stand here (down out of the witness-box), irrespective of the light from that window, does the fact that your view of the sky is there obstructed, darken this room?

A. I think it does.

Q. And does it darken it more the more you retreat from the window, as you go back here?

893 A. Yes, sir.

Q. If you bring that building within 50 feet of you it darkens it more and more?

A. Yes, sir.

Q. And would any object, introduced between your vision and the sky, darken the light proportionately?

A. As that demonstrates, it would seem to do so.

Q. Now you have examined that structure here, the model, have you not?

A. Yes, sir.

Q. We have not put it in evidence, by proof, by its proper proportions with the engineer's plans. Now, with the structure as it stands, without the cars, with dust-pans under every track, solid, standing in the proportionate proximity to this building as it stands there, and the scale is 5 feet to the inch, have you any doubt that, with that structure standing there on the curb of the street, as you remember it, without regard to the distance between the Backus 66-55

property and the structure itself, but as you remember the curb of the roadway, with the structure standing there, with these dust-pans and the ties of six inches and spaces of 8 inches only, with the openings of the tracks, as shown in that model, and with the roadway beyond it, on the Michigan Central side of the street, 24 feet wide, a solid roadway, have you any doubt that it will darken the windows of that building?

A. Not any.

Q. And darken it for the work inside?
A. The lower portion of it, it would certainly do so.

Q. Now, I will ask you one more question, as a business man, and it is suggested by a question asked by one of the jurors. You are anxious to go into the planing-mill business, or a man is 894

anxious to go into the planing mill business; we will put it as a hypothetical question to you, as an expert business man-a man is anxious to go into the business of planing mills, and he is looking about for a site-or a manufacturing business-do you think he would buy that place or that site for it, with that structure erected?

A. In the planing-mill business it would certainly be very unsuitable; it might not be for some businesses, as a chandler's.

Q. Do you think a man wanting to go into a manufacturing

business would go into it with that structure there?

A. Would it not be well to qualify it by saying at a certain price? Q. Would he buy it for a planing mill; would any man going to carry on a business unconnected with railroad business buy such a piece of property as that?

A. If he bought it at all he would do it as a bargain.

Q. A man might carry on a car-manufacturing business there?

A. Yes, sir.

Q. He would not buy it as a planing-mill business under any circumstances in your judgment?

A. No, sir, he would not.

JUROR: What effect would the cars passing back and forth by the mill have on the mill?

A. They would increase the hazard.

Recross-examination by Mr. Baker:

Q. Would anybody buy the Backus planing mill and yard as it is now situated for the purpose of carrying on the planing-mill business, even if the elevated road was not to be built there?

A. I would not, but I don't knew what another man might 895 do with it.

Q. You say that Mr. Backus has got all the railroad facilities that he wants, and that you have?

A. I said that we had, and, as far as I knew, Mr. Backus has. Q. Will you please tell us what the switching charges are from the Michigan Central road to the Wabash?

A. They are \$2 where they are charged.

Q. In what cases do they charge?

A. To non-competing points.

Q. What are non-competing points?

A. Points that would not be reached at the same rate or approximately by the Michigan Central or its connections.

Q. What are the switching charges from the Michigan Central to

the Grand Trunk?

A. That varies; if a car is going east-bound, it is \$6, and if it is going into Michigan it is \$2.

Q. If it is going into Michigan it is \$2, and if you want to go over

the Grand Trunk east it is \$6?

A. Yes, sir.

Q. And that is just what the Michigan Central charges you to deliver it to the Grand Trunk—switching charge?

A. Yes, sir; but it is not because it is worth \$6.

Q. But they charge it. Now do you undertake to say that it would not be an advantage to any one of the manufacturing institutions in this city, to be connected with two or more different railroad systems?

Mr. Dickinson: I want to ask a question right there.

Mr. Baker: Wait a minute. I am examining the witness now.

Mr. Dickinson: I want to ask him right there if he pays

that charge.

Mr. Baker: It does not make any difference. I have asked him, and he answered that the switching charge on the Grand Trunk is \$6 on east-bound business, and I followed that up by asking him whether it would be or not an advantage to a business institution in this city to have connection with the Michigan Central and also with the Grand Trunk?

A. I would not care anything about the Grand Trunk. I can reach every point on the Michigan Central that I can get over the

Grand Trunk.

896

Q. But suppose you wanted to do business to points that were reached by the Grand Trunk that you could not reach the other way?

A. They are unknown to me.

Q. But many of them exist, do they not?

A. That may be.

Q. So that it is not true, as a general proposition, that a business institution has sufficient railroad facilities when it only connects with one?

A. I would not say yes to that question, because I don't think so, for I think the Michigan Central affords facilities that will reach every point.

Q. But when you go to certain points on the Grand Trunk they

will charge you \$6 for delivering the car to them?

A. If you ship it from here to the Grand Trunk, but if you ship it to Buffalo you can get it on the Grand Trunk without any charge.

Q. Because they compete there; but suppose you are going down

in New England somewheres?

897 A. That is all right.

Q. Suppose you are going down into Lower Canada?

A. I don't ship there.

Q. Is it not a fact that you don't go there because of those shipping charges?

A. No, sir.

Q. Is it not a fact that you don't go there because you have not adequate facilities?

A. No, sir, I have not looked for any business there.

Q. Didn't you fail to look for any business there because of the lack of facilities?

A. I never sought for any business there, I never cared for it; I

had plenty of business elsewhere.

Q. But if the charges were equal you could do business there?

A. If there is anything doing, I could.

Q. They being unequal, you could not do business there successfully?

A. I never tried.

Q. And you have not tried because of the inequality—is that not true?

A. I would not say that, because I have not given it any thought.
Q. Did you mean to testify that that building over there darkened

this room and not the curtain?

A. I said that the room was darkened by the non-reflection of the light.
Q. Did you mean to testify that the building over there darkened

this room and that the curtain didn't?

A. I said by the appearance it darkened it.

Q. Is it not true that this room is darkened by the curtain and is not darkened by that building a particle?

898 A. I don't think so. I judge from our experience in the Moffat building, from the Hammond building; when they put that building up we had a deficiency of light by it.

Q. Do you testify that in your judgment the Williams block or

Kanter block darkened this room this afternoon?

A. It seemed to do so.

Q. After the curtain is pulled down it seemed so to you?

A. Yes, sir.

Q. You say that a railroad could not handle your business down there in your yard?

A. I don't understand the question.

Q. Didn't Mr. Dickinson ask you whether or not the railroads could handle your lumber and get it to your planing machines for you?

A. Yes, sir.

Q. You said they could not do it?

A. It could not be done advantageously.

Q. Do you mean to say that a railroad could not handle business between two points that are half a mile apart?

A. No, sir; I don't mean to say they could not, but I said it was

not practicable.

Q. You say it is not practicable to have it done on your own yard, because everything is right there handy?

A. Yes, sir.

Q. You used these two trucks and do your entire business and do it cheaply?

A. Yes, sir.

Q. Suppose your lumber yard was half a mile or more up on that switch, beyond the sulphite works somewhere, at least half a mile away, do you mean to testify that the track there could not be utilized and made advantageous in handling the lumber between your yard and the mill?

A. If they had a good road, it could not be made available with safety, for the reason that you have to handle the lumber on the car, and then again off the car; we do not

remove it from the wagon.

Q. Suppose you had tramways?

A. Then you would have to handle it from the truck to the car.

Q. And then suppose that you put it right alongside of the mill, so it could be slid right to the machine?

A. It takes a man on that car to pass that lumber off.

Q. But it takes a man to shove it, anyhow?

A. No, sir; the machine operates it on to the trucks.

Q. Now, you built a railroad up there in your country on purpose to accommodate your business?

A. Yes, sir.

Q. And you have got a side track down here, and it is certainly practicable to carry lumber in greater quantities and at less expense on a railroad than you can do it by teams, as a general proposition?

A. Yes, sir; it certainly is.

Q. You say that the ordinary switching charge here in Detroit is \$2?

A. Yes, sir.

Q. And how many thousand feet is permissible for a load of lumber?

A. I have seen 20,000, I guess, on a car; that would be ten cents a thousand; but it does not pay anybody to load in that way.

Q. Well, it may not in the situation you are; I don't think it would, but the question is whether it might not pay Mr. Backus, and that will depend on how much it costs him the other way, and we will find out before we get through with it.

No answer.

900 George W. Robinson, sworn in behalf of respondents.

Examined by Mr. Dickinson:

Q. Where do you live?

A. Detroit.

Q. How long have you lived there?

A. Twenty-six years, I think. Q. What is your business?

A. I am in the lumber business.

Q. How long have you been engaged in that business? A. The greater part of the time I have been in Detroit.

Q. And in what branch of the business?

A. Largely in shipping, planing mill; I have been in the wholesale trade, also in the retail trade, to a more or less extent, doing a little of both.

Q. And whereabouts in Detroit?

A. Some years ago, just about where the Wabash passenger depot now stands, below Twelfth street on Woodbridge street.

Q. Do you mean the Wabash depot or the Wabash yard?

A. Depot.

Q. How much of a depot is there?

A. They call it a freight depot, perhaps, right in that neighbor-Since that, on Fort street west, near the corner of Tenth Now I have a yard at Delray, just below the Exposition.

Q. Are you familiar with the Backus property?

A. Yes, sir.

Q. Do you know the mill?

A. I know the mill pretty well; I have seen it.

Q. Have you been inside of it?

901 A. I have not been inside that I remember. Q. You know the situation upon River street?

A. Yes, sir, I know the situation well; I have passed it a great number of times.

Q. And you know its relative situation to its lumber yard and its storehouse?

A. Yes, sir.
Q. In view of the magnitude of the business, and in view of the kind of business, what have you to say as to the plant being well situated for doing business of that kind?

A. I see no reason why the business could not be handled advan-

tageously.

Q. It is pretty successfully arranged, you think?

A. Well arranged I think under existing circumstances, that is, the expense of property in the city, and those things taken into consideration.

Q. You know the extent of business that Backus does, the amount of raw material that he must handle in connection with the capacity of his mill?

A. I never made an estimate of the amount that he might handle,

but it must run up well into millions.

Q. And it is necessary for him to have a large assortment on hand?

A. Yes, sir, in order to do his business successfully.
 Q. You know the general situation of the Backus property?
 A. Yes, sir.

Q. Will you please state how, in your judgment, the value of the property would be affected if a structure should be built upon River street in front of the Backus property, spanning the entire curb, the

posts on the edge of the structure standing just inside the 902 eurb, on which should be placed ties and tracks, the struct-

ure standing in the clear over the roadway 14 feet, with the top of the tracks 25 or 26 feet above the roadway, and standing about on a level with the floor of the third story of the Backus property, and over that structure should be run all the passenger trains of the Flint & Pere Marquette, the Detroit, Lansing & Northern, the Canadian Pacific and the Wabash, coming to Detroit, and the package freight business with the city, exclusive of the heavy lumber and coal of the Detroit, Lansing & Northern and the Flint & Pere Marquette, conducting the general business of railroads in passengers and freight to that extent, those four roads, over the structure, to connect with the union depot at the corner of Third street and Fort street and below, the corner nearest the center being on the corner of Third and Fort streets; what would be the effect on the Backus property, in your opinion?

A. If I was to take the matter into consideration-for say a term of ten years, if the property was mine, I would move the machinery out and build a mill somewhere else and do the best I could with the real estate. It would be rth less; it would be worse than useless, I believe, to undertake run that for a term of ten years,

rent free; that is just my opinion about it candidly.

Q. You would not start a planing mill there if it was given you rent free?

A. No, sir, I would not consider it for a minute.

Q. Have you any interest in the Backus matter at all?

A. Not a dollar; but I take the matter from the point of inconvenience, the noise that must be in the passing of trains, making it obscure-almost dark, I should say-and the matter of extra insur-

ance, the inconvenience, taking it altogether, many other things, even though I should get that property, the build-903 ings and real estate, without a dollar of cost for a term of ten years, it would be better for me to go and buy a piece of property elsewhere.

Q. Rather than to take it without charge?

A. Yes, sir.

Q. If you were compelled to run a mill?

A. Yes, sir. Q. You think the fire risk would be increased?

A. There is no thinking about it, as I understand it; that is a fact.

Q. And the fire insurance rates?A. They would be increased.

Q. On what do you base your judgment in that regard?

A. There must necessarily be sparks from a locomotive, even with great care, and even with the greatest care; with a light train, on a downgrade, you would have very few sparks; but with a heavy train, and with an upgrade, there would be a great many, and there is no obstruction that I have ever seen yet that will prevent it with a heavy train; and I have watched that very carefully in the Pennsylvania depot, where they take the greatest care possible, and on the starting of their heavy trains there is invariably a puff of sparks comes out of their smokestack.

Q. And you have observed trains going up a grade?

A. That is visible to any person, going upgrade with a heavy train on, that there will be more or less fire come out, even though it may be very fine.

Q. Have you had any experience in receiving lumber?

A. Considerable.

Q. By the Flint & Pere Marquette and the Detroit, Lansing & Northern?

A. Yes, sir.

904 Q. What is the condition of lumber as received, and what is the first business in order when lumber is received over those roads?

A. Very often, when we receive it on open cars, we are very careful to get the cinders off, which will sometimes be half a ton on a

car.

Q. How much?

A. Half a ton, easily enough, on a car of lumber, when it runs near the engine. I have never estimated it, but there is a very large amount of einders on a car; so much so that when we are not very careful, with good lumber, it damages the lumber very materially; we have always had that to contend with in receiving it by open cars; in wet weather, when those are likely to get washed down into it, we are very careful to give orders to ship in box cars; there is a very large amount of cinders.

Q. In one car-load, you say there is how much?

A. I will say that, judging from the size, estimating half a ton, from the size of half a ton of coal that will be scattered over—coal screenings.

Q. You never weighed it, but it would take what would be equiva-

lent to half a ton of coal screenings, in appearance.

A. It would take what would be equivalent of half a ton of coal screenings, in appearance; I don't know what the weight of it would be.

Q. But estimating it as you would half a ton of coal screenings?

A. Yes, sir.

Q. And have you seen on open cars any effect of the burning of these cinders on the wood?

A. As a rule, they are not burnt much.

Q. Are they covered; have they a top also?

905 A. As a rule, they have not been burnt; I have not noticed that they are burnt much, because lumber is generally damaged always on top, and it is liable to be wet as well as dirty.

Q. Are you at all acquainted with the dust that rises in a plan-

ing mill?

A. Yes, sir, I am.

Q. What familiarity have you with that?

A. I have run planing mills to quite an extent.

Q. Whereabouts?

A. Down on Franklin street, the old planing mill of D. A. Ross & Company, and of later years for myself.

Q. When did you last conduct a planing mill?

A. It is about seven years since I ran a planing mill.

Q. And where was the last one you ran?

A. At the corner of Twenty-fourth street and the Michigan Central railroad.

Q. You had the Michigan Central near you, then?

A. Yes, sir, we were right near the track. I have a yard there at the present time.

Q. But you did have a planing mill, and how near to the track? A. It was very near the track, just room enough for my own siding.

O. How did you arrange your business with reference to the

main track?

906

A. I arranged that just so I could get in my siding between that and the main track; it was on an angle there, and the greater part of the mill was away a distance say of 50 feet from the main track.

Q. How large was your building?

A. One-story building, only for planing purposes, not for box purposes at all.

Q. Did you have a dust-room?

A. Yes, sir.

Q. Where was that situated?

A. That was situated on the east end, but on the corner furthest away from the railroad.

Q. You built your mill there; did you build it there after the

Michigan Central came?

A. Yes, sir.

Q. With reference to the Michigan Central road?

A. Yes, sir.
Q. You know how the Michigan Central runs along by the Backus property there, and what facilities he has?

A. Yes, sir.

Q. As a practical business man, with a side track from the Michigan Central road, do you think that Backus has all the railroad facilities that he needs?

A. I would say so.

Q. Have you in your business a side track there now?

A. Yes, sir.

Q. From what road?

A. The Michigan Central. Q. You have all you need?

A. Yes, sir.

Q. Would you have another side track in there if you could have it?

A. Not to give the ground for it.

Q. You would not be discommoded with it?

A. I would consider the land of greater value than any possible value that would arise from having the additional track?

907 Q. Is there any point in railroading now that the Michigan Central and its connections do not reach that the Wabash reaches?

A. I have not had any occasion to ship to any points, but there

Q. You ship by the Wabash? A. Very little.

Q. But you do ship? A. Very little.

Q. Do you ship by the Flint & Pere Marquette?

A. In-bound freight. And I will say how as to the Wabash, that in-bound freight I ship by the Wabash.

Q. You know of no difficulty in getting in?

A. No. sir.

Q. Or using your side track?

A. No, sir.

Q. Or the Detroit, Lansing & Northern?

A. No, sir.

Q. I don't suppose you have done much shipping by the Canadian Pacific?

A. Not very much, although I have some.

Q. You don't get much in-bound lumber by the Canadian Pacific, with the tariff?

A. We get a little.

Cross-examination by Mr. BAKER:

Q. You say you have got a yard at Delray?

A. Yes, sir.

Q. Where is it located?

A. Just adjoining the Canadian Pacific. Q. What railroad does it connect with?

A. The Michigan Central.

908 Q. How far from Thompson's-the Delta lumber planing mill?

A. I think three-quarters of a mile.

Q. On the same switch? A. No, sir.

Q. On another switch?

A. Yes, sir.

Q. Are you on the water too?

A. Yes, sir.

Q. It connects with the Michigan Central line that runs from here to Toledo?

A. It connects with the Exposition line. Q. Is not that a Wabash connection?

A. No, sir, it is a Michigan Central connection.

Q. Does it not go into the Wabash tracks?

A. Not that I am aware of. The Michigan Central put it in and controls it.

Q. It is down there on the flat?

A. Not on the flat.

Q. It is their line that runs to the flat, the switch runs to the flat?

A. The Michigan Central run down there. They have tracks all along running into the Exposition building.

O. What switching charges do you pay to have a car taken from there by the Michigan Central and delivered to the Grand Trunk?

A. I don't pay anything. Q. Do you send any?

A. Yes, sir. Q. Whereabouts is it delivered to the Grand Trunk?

A. I suppose at West Detroit. I never questioned that point. The Grand Trunk pays all switching charges.

Q. The Grand Trunk pays the charges? A. Yes, sir. 909

Q. And adds it to the freight I suppose?

A. No, sir, they pay the charges and it is not added to the The Grand Trunk delivers cars to the Michigan Central for me without any charge to me.

Q. What companies do charge you switching rates? A. Not any.

Q. You never had to pay anything in that way?

A. Not for a long time.

Q. What does the man pay to whom you consign?

A. I deliver all my lumber to points east.

Q. And pay the freight?

A. Yes, sir.

Q. East-bound—the New England States?

A. Largely to Pennsylvania, I could not say the New England States, but largely to Pennsylvania. I ship over the Grand Trunk largely.

Q. To what points on the Grand Trunk?

A. Everywhere, all points on the Grand Trunk that reach the destination east, on connecting lines.

Q. You do very little shipping on the Grand Trunk?

A. I do a very great deal on the Grand Trunk. Q. To what points do you go to?

A. Not on the Grand Trunk to any point, because the Grand Trunk ceases at Buffalo; connecting lines take it, and it is their connecting lines, but in no case do I pay any switching charges over the Grand Trunk road; in case I want a Grand Trunk car delivered to any place on the Michigan Central tracks, it is delivered.

Q. What does the Grand Trunk pay the Michigan Central

for it?

910 A. Six dollars.

Q. Then there is a charge?

A. But when it reaches Philadelphia the freight is no greater.

Q. When you reach competing points it is no greater?

A. No, sir.

Q. And you don't ship to any place but competing points?

A. I know of no point within the limits of the United States that the Grand Trunk reaches that cannot be reached by other roads, where we ship lumber to, as lumber dealers.

Q. Are there not many points on the Grand Trunk where you

could not reach them by the Michigan Central?

A. I know of none within the limits of the United States where we ship lumber to east points.

Q. None in Maine or Vermont or any of those places?

A. I know of none that I could not reach by other lines, from the fact that the Grand Trunk and the Michigan Central will connect at the same road at Buffalo, and it is a competing point to Buffalo; and the other lines will take it from either the Grand Trunk or the Michigan Central there.

Q. Do you know that it is true that the Grand Trunk pays the

Michigan Central six dollars for each car?

A. I believe it is true from this fact, that I can get a place built in my own yard without any charge, but if I wish to haul to the Grand Trunk, they tell me that they pay to the Michigan Central.

Q. How many cars did you ever see with half a ton of cinders

on?

A. I don't say I have seen them with half a ton of cinders. I corrected that by saying that I thought from the pile of cinders that was on that it was about as large as half a ton of coal screenings.

Q. How many cars have you seen like that?

A. A great many in my time. All cars are not in that condition. It depends whether they are near the engine or not, but I have seen a great many cars like that in my time.

Q. That would be in wet weather?

A. Wet and dry; they are more apt to be blown off in dry weather.

Q. I want to know when you saw them with half a ton on.

A. I am estimating by comparing with half a ton of coal screenings.

Q. You built a planing mill on Twenty-fourth street on the Michigan Central line?

A. Yes, sir.

Q. And you just left room enough between the buildings and the

Michigan Central to put in a side track?

A. Yes, sir, I did at the corner; that is, where the store-room was, where the planing mill was; it would be 50 feet or more from the Michigan Central.

Q. How many feet was your building from the Michigan Cen-

tral tracks?

A. I suppose 20 feet at the corner—

Q. And you put a side track right alongside of it there?

A. Yes, sir. The corner was about 20 feet, just room enough for two tracks, I think. Then when we got to the back end of the building, 150 feet, we were nearly a hundred feet from the Michigan Central railroad; it is on an angle there, and that is where the planing mill proper stood.

912

O. And how far was the building where your planing

Q. And how far was the building where your planing machines were from this side track?

A. The nearest point would be about 50 feet.

Q. Is that mill there now?

A. No, sir; it was torn down to make room for other manufacturing institutions.

Q. How long did it stand there?

A. I think it was built in 1883, and it was taken down last year.

Q. In 1890; so it stood there seven years?

A. Yes, sir.

Q. How many times did the railroad set it afire while you were there?

A. I think not at all.

Q. How many times did you ever know of a railroad to set a planing mill afire?

A. I cannot say that I know of any, actually.

Q. Where is your present mill?

- A. I have not any mill at present; I am not running a planing mill.
- Q. But you say that you would not care to give the ground for another side track?

A. I would not give the ground for another side track, with the

present facilities that I have.

Q. But suppose you could connect with another system of railroad and save six dollars a car, you would be very glad to have a side track, would you not?

A. Under the interstate-commerce law, I suppose all lines are aware that they are not allowed to pay six dollars a car for the sake of their business.

Q. They have no right to pay a rebate?

A. They are not paying a rebate; they are merely paying terminal charges.
Q. And the terminal charges are six dollars a car?

A. Yes, sir.

Q. Suppose you could save that?

A. I do save that.

Q. And if you had a switch to the Grand Trunk you could save

it all the time, could you not?

A. No, sir; I could not so much as get six dollars for hauling a car; then they would be on an equal footing with the Michigan Central railroad, and would deliver the cars, instead of hauling them into the Michigan Central.

Q. Could they not, as a matter of fact, haul them for \$6 less than

now?

913

A. They would not be allowed to under the interstate-commerce law.

Q. You testify to that?

A. Unless they made it to all shippers alike, then they would have to make it to shippers on their own line as well as to shippers on the Michigan Central.

Q. Do you understand that the interstate-commerce law does

away with all the shipping charges?

A. I understand that the interstate-commerce law—

Q. Just answer my question. The question is, do you under-

stand that the interstate-commerce law does away with all switching and terminal charges?

A. No, sir; I don't.

Q. You think that if you owned the Backus planing mill, and they should build an elevated road in front of it, you would tear it down and move somewheres else?

A. I certainly should look about for another, pretty quick.

Q. You would tear it down and move somewheres else, if you owned it, anyhow?

914 A. No, sir; I would not.

Q. Do you think that is a good place to have it now?

A. I have noticed the Backus family for a good many years, and I have noticed that they appear to live as comfortably as I do, by managing my business as economically as I can possibly do, and I suppose they are making money; I have never heard anything different, I know they pay their debts.

Q. Is that all you know about it?

A. I suppose they have been making some money.

Q. You think they are making money there because they wear good clothes and are living well?

A. I suppose that a concern that has been in business for a great

many years must be.

Q. Do you know how much they have made out of railroads in that time?

A. I don't; nor do I know how much the railroads have cost

Q. Don't you know that the money that they have made out of railroads they have sunk in that mill?

A. I don't know about that.

Q. You don't know what kind of business they have carried on there?

A. I know something about their business, as much as I ought to, without being inquisitive.

Redirect examination by Mr. Dickinson:

Q. How do you think they have acquired seven and a half acres of yard, three acres for their planing mill and a valuable storehouse on Fort street west—out of railroads or by carrying on a legitimate business?

915 A. I rather think they have acquired that out of their legitimate business, from what I supposed; I never heard anything to the contrary.

Adjourned to Thursday, July 2, 2 p. m.

THURSDAY, July 2, 1891-2 p. m.

W. B. KNAPP, sworn for respondents.

Examined by Mr. CHIPMAN:

Q. Where do you live?

A. Detroit.

Q. How long have you lived here?

A. 11 or 12 years.

Q. What is your business?

A. I have been in the lumber business during that time.

Q. In what particular branch of that business? A. Almost all parts of it at different times.

Q. You have been a lumber inspector?

A. Yes, sir.

Q. And have done almost everything in the business?

A. Yes, sir.

Q. Where are you at work now?

A. I am not doing anything at present in that line.

Q. Where were you employed last?

A. I was for a little over ten years with Backus & Sons.

Q. Where?

A. Here in Detroit.

Q. What particular place? A. I was most of the time at Eighteenth-and-a-half street, where

the yard is. I had charge of that place during that time. Q. Of course you know where that yard is situated? 916 A. I do.

Q. You know where their planing mill is?

A. I do.

Q. And you know also where their Fort Street storehouse is?

A. Yes, sir.

Q. While you were in their employ, where did your business take you the principal part of the time?

A. At the foot of Eighteenth-and-a-half street, where the yard is located.

Q. Did you there have the occasion to observe the effect upon lumber of passing trains on the Wabash through that lumber yard? A. I did.

Q. As I understand it, the Wabash track cuts the yard in two? A. Yes, sir.

Q. There are parts of the yard on each side of the track?

A. Yes, sir.

Q. Will you tell the jury what the effect of the passing of those trains is upon the lumber?

A. It blackens the lumber and destroys its value to a certain extent.

Q. How does it blacken it?

A. The smoke and dirt coming from the locomotives become grimed into the lumber more or less, according to its locality and distance from the track.

Q. Where does the smoke and the dust affect the lumber principally; what part of the lumber pile?

A. It is generally pretty well scattered through it.

Q. The boards are piled on string pieces about the width of each board, so as to allow a space for the air to work in between the boards?

A. Yes, sir.

917

Q. You say these cinders and discoloration work pretty much through the piles that are nearest the track?

A. Yes, sir.

Q. Did you observe any effect of fire upon any of that lumber?

A. I have.

Q. What did you notice?

A. I have noticed several times where coal has burned in slightly in the boards; those piles nearest the track; I don't know just how far off, probably 30 or 40 feet perhaps.

Q. How far back from the track did you observe the effects of the

cinders and discoloration upon the lumber?

A. I don't know that I can tell how far back; as you go from the track, it discolors it less; the greater the distance the less it is discolored, either way.

Q. How far back did you go before you lost the effects of it en-

tirely?

A. Perhaps a couple of hundred feet.

Q. About a couple hundred feet from the tracks on both sides, you think you would find more or less of the effects of the cinders and smoke and discoloration?

A. Yes, sir; it might not be quite as far, and it might be a little

further.

Q. But the effect grew greater as you got nearer the track?

A. Yes, sir.

Q. Can you give the jury any idea as to the quantity of cinders which fell on and worked into these lumber piles; say at the place where there were most of them?

918 A. I don't know as there is any place where there would be the most at the same distance from the track; it would probably be about the same amount.

Q. Take those that were 40 feet from the track; those that were

burned?

A. It would take but very few courses of lumber to get a quart or two of cinders off of them.

Q. What effect do the cinders and discoloration have upon the lumber?

A. It depreciates the grade.

Q. I suppose in depreciating the grade, it depreciates the price? A. Yes, sir; that is, the valuation is made either in the grade or

in the price.

Q. What did you do with this lumber after it was covered with

cinders; do anything to clean it?

A. We cleaned it off the best we could. Q. With what regularity is that done?

A. In drawing the lumber, it was customary to jar the cinders off as much as possible when taking it out of the piles, and after one or two courses had been jarred, shove it up to the edge and dump it over the side, so as not to walk on it any more than was necessary, because in handling it over it often makes it worse than it originally was.

3/13

Q. With a rough board, walking over it, it would grind the cinders in, would it not?

A. Yes, sir.

Q. The cinders are apt to get imbedded in the rough surface of the board, are they not?

A. Yes, sir; also the smoke will work into the fibres of the wood,

so that it discolors it.

Q. Any sweeping done on this lumber?

919 A. Yes, sir.

Q. How often, how regularly, and why?

A. In unloading the cars it is customary to sweep the car off every course or two so as not to walk over the cinders, because if in handling the lumber the cinders jar off, if they are not swept off, they become ground in the same as in the pile.

Q. Did you get lumber from the F. & P. M.?

A. I have at different times.

Q. Did you get some from the D., L. & N.?

A. Yes, sir.

- Q. Take the F. & P. M. road, what was its condition as to cinders?
- A. There would be some cinders on the cars. It would not be always alike. Some cars would have more than others, perhaps.

Q. About what proportion?

A. Every car would have some. Q. And some more than others?

A. Yes, sir.

Q. Did you ever see a car on fire down there?

A. I never saw a car of lumber on fire. I have seen a freight car on fire.

Q. On what road?
A. On the Wabash.

Q. Do you know how it caught?

A. This was a freight car standing on the side track very close to the main line, in which we were loading lumber, and directly after this train had passed I saw a little smoke from the top of the car, and I got a pail of water and put it out.

Q. That was immediately after it had passed?

920 A. Yes, sir, it got to a blaze before I got the water, perhaps as large as your hand.

Q. How near did the locomotive pass?

A. The next track; perhaps the center of one track to the center of the next.

Q. Do you know anything about this elevated track that they propose to build down there in front of Mr. Backus' mill?

A. I have seen the map of it, and I have seen that part of it that is now constructed down there, or being constructed.

Q. Do you know that the grade is $52\frac{1}{2}$ feet to the mile up to just before they get to Backus' place?

A. I understand that to be the case.

Q. You know that the track there, the posts, or uprights, which hold this track, span the street from curb to curb?

68 - 55

A. Yes, sir, I so understand it.

Q. Did you know that immediately opposite Backus' place there is, commencing below Twelfth street, and running clear up beyond Backus' place, occupying a part of the sidewalk, the street opposite Backus, and also a portion of the Central grounds, what is called a viaduct for teams to be built there?

A. Yes, sir.

Q. Do you know that this structure is to be 14 feet in the clear in front of Backus, from the ground up; that it is to be about 25 feet in height?

A. Yes, sir.

Q. Do you know the situation of things at the Backus mills?

Q. Do you know where the dust-house is?

921 A. Yes, sir.

Q. Where the dry kilns are, the engine and so forth?

Q. And the Michigan Central spur which runs in there?

A. Yes, sir. Q. You know the entire situation?

A. Yes, sir; I have been there a great many times.

Q. Will you tell the jury what effect in your judgment the erection of this structure there, and the use of it by a railroad will have upon the value of that property?

A. As to the value of that property, I cannot say; it will practically ruin the property for planing-mill purposes, and ruin the planing-mill business there.

Q. You think it would ruin it?

A. I do; the fire, the dirt and the smoke coming from the trains which pass on that structure, and more or less darkness will be caused by those trains and this structure in front of the property; it would, I think, practically ruin the planing-mill business there.

Q. Do you know what is done inside of the planing mill?

A. I have been through it hundreds of times.

Q. Do you know the nature of this dust which collects around a planing mill, and which they try to confine to the dust-room?

A. Yes, sir; I know just how inflammable it is, from the fact that I have tried it by taking a handful of it out of the street and stringing it along and touching a match to it.

Q. What is the result?

A. It will run just like powder.

Q. So that you have no doubt it would ruin it for planing-mill purposes?

A. No question about that in my mind.

922Q. Increase the risk of fire?

A. Yes, sir.

A JUROR: You experimented by setting the dust on fire?

A. Yes, touching one end to see if one part would catch from the other; just a handful-string it along like a string of powder.

Q. It would ignite as fast as gunpowder?

A. Run right along like powder-yes, sir; that is this dust that

accumulates on the side of the building, inside of the dust-room and throughout the interior of the mill-anywhere where there is sawing and planing to be done,

Q. Was there any breeze while you were doing that?

A. None to speak of, else it would have blown it away before it was touched.

Q. Do you think it would blow it away or ignite whether the wind was blowing or not?

A. It is just as explosive as powder.

By Mr. CHIPMAN:

Q. Have you heard of any fires being set by locomotives within a few days?

A. Yes, sir. Q. Where?

A. I heard of one yesterday.

Q. Where was that?

A. At the foot of Twenty-fourth street, where the Wabash crosses Twenty-fourth street.

Q. What was it?

A. Alongside of the Wabash track, just below where Morley has a lumber yard.

Q. When did that occur?

A. It must have been yesterday, or day before. I was there yesterday and saw it, and saw it again today. 923

Q. The same fire?

A. Yes, sir.

Q. Smoking there yet?

A. Yes, sir.

Q. Do you know whether that is the fire and smoke we saw alongside of the track when we went out night before last?

A. The man that was working on the dump, where they are dumping dirt, said he was within a little ways, and it started up directly after the train had passed.

Q. What other fire have you heard of?

A. I was in Saginaw a short time ago and I heard of one there.

Q. What was that?

A. That was just outside of A. W. Wright's lumber yard.

Q. What was it?

- A. It was a little flame started up near the track, and they attributed that to locomotive sparks, inasmuch as there had been no fire around there and the trains were passing there every little while.
 - Q. What did the fire start in?

A. Sawdust on the ground.

Q. Did you see that?

A. I saw the place where it had burned.

Q. You saw the place on Twenty-fourth street too?

A. Yes; I did not see them catch fire.

Cross-examination by Mr. BAKER:

Q. You did not see this fire start in Saginaw, did you?

A. No.

Q. How far outside of the lumber yard was it?

924 A. I don't know just where the line is, perhaps 100 or 125 feet from the lumber piles.

Q. How close to the lumber piles does the railroad run?

A. In some places it is closer than others, I should say perhaps 50 feet would be as close as the main line would be to the lumber, perhaps further than that.

Q. And side tracks on that 50 feet?

A. No, the side tracks are outside of that.

Q. You don't know how this fire started, did you?

A. Only as I tell you.

Q. You don't know how the fire started down below here?

A. Only what this gentleman told me.

Q. This fire below caught in a lot of rubbish? A. Where it is thrown in there in making a fill.

Q. It is usual to keep rubbish of that kind around a planing mill?

A. No, we calculate to keep a planing mill as clean as possible.

Q. You say that this dust which is thrown cut by planing machines, when it collects together in considerable quantities, it is inflammable; it will burn, I suppose you mean?

A. Certainly.

Q. Is it usual to allow that to collect about a mill?

A. No more than is absolutely necessary.

Q. They have an apparatus there for gathering that up?

A. So far as it is possible to gather it up.

Q. They sweep down the ceilings?

A. Yes, sir.

Q. And keep the mill clean?

A. Where it is possible to keep the mill clean.

Q. You were down there in that lumber yard a great many vears? 925

A. Nine or ten years.

Q. You were there when the railroad was put through?

A. Yes, sir.

Q. Did the railroad ever set fire to the lumber in the yard?

A. I don't know. We had two fires there; whether it came from the locomotive, I don't know.

Q. Where did the fire catch that you speak of? A. Probably 150 feet from the railroad track.

Q. Didn't that fire catch from a passing steamboat?

A. I don't know; it was 200 feet, probably, from the river.

Q. You don't know which it caught from?

A. I don't know.

Q. What is your judgment about it?

A. I have no way of forming an opinion either way.

Q. Don't you know that a steamboat had just gone by when that caught?

A. I do not.

Q. Where was the other fire that you speak of?

A. Nearly in the same place, probably a week or so after; only a small fire, put out with a pail of water.

Q. A very dry time of the year?

A. Not necessarily dry, it was in the fall of the year.

Q. What did it catch on? A. When I got there, there were half a dozen piles on flame, so I could not tell.

Q. Did it catch on the lumber or in the alley?

A. I think it caught in the lumber piles, but I am not sure of that. All I know is that the fire was there when I got there. 926

Q. Those were the only two that occurred during the entire 10 or 11 years you were there?

A. I think that is all.

Q. When you were there the main switch for the Wabash yard down there, the old union depot company yard, was located right close to the Backus property?

A. One of their switches was there.

Q. And almost the entire switching on that yard was done on the right of way that ran through this lumber yard?

A. Not entirely. There was an engine working at each end of

the yard.

Q. There was an engine working there all the time?

A. A good deal of the time.

Q. When an engine was working there, doing yard-work through the lumber yard, day in and day out, the lumber was badly discolored in course of time. It would depend upon how long it was left there?

A. Yes, sir.

Q. You know that Mr. Backus recovered of the railroad some \$60,000 for these injuries?

A. I do not.

Q. You were a witness in some of the cases?

A. I was a witness in one case.

Q. You know when the railroad was built there?

A. Yes, sir; I was not a witness in that case.

Q. The lumber would have to be left there a considerable length

of time to be seriously injured.

A. Not a considerable length of time. In some parts of the yard it could be left there a considerable length of time and would not be seriously injured. In other parts of the yard, it would injure very quickly.

Q. If a pile of lumber is piled next to the track, or along-927side of the tracks, and it is only left there a short time and manufactured, and a new supply put in, it would reduce the damage from the soot and cinders to a minimum, would it not?

A. It would reduce it some?

Q. Mr. Backus does not store lumber at the planing mill?

A. Yes, sir.

Q. Whereabouts?

A. In the mill.

Q. I mean outside?

A. Not in large quantities, because there is not sufficient space for it.

Q. He simply hauls his lumber up there and unloads it into the doors near the planing machines, and it goes away from there every day?

A. It is run through the planing machines and dressed and sent to the proper floor, where it is sorted and from there they take their stock daily. There is probably a half million or a million feet in there ready for these machines.

Q. Then it is on the move from the time it gets there until the time it gets out, in some shape, it is being moved up and down that mill?

A. No, it goes to the top and remains there until they have an order for that certain kind.

Q. It is in that condition. It is in the building, they do not put it on the roof?

A. No, it is in the building.

Q. And it is in process of manufacture?
A. It is waiting the process of manufacture.

Q. How much do they feed to the mill every day?

A. Perhaps an average of 50,000 or 60,000 feet.

928 Q. And about the same amount must go away in finished products?

A. Practically.

Q. You know enough about lumber to know that if you piled it up out in the country, the weather would discolor the lumber?

A. Except the roofing boards it will not discolor.

Q. It will not discolor it if it is left open, so that the air can go

through?

A. If it is piled tightly in the country, it will, but if it is carefully piled in the country, away from any smoke or dirt, it will not discolor it, except the boards that are on the roof, where the sun strikes.

Q. Take it off of Woodward avenue, where they have a lumber yard, and there is not a railroad within a third of a mile of it, it will be discolored by the smoke that prevails in the city?

A. I never noticed the yard.

Q. Suppose you piled it up right here on the Campus Martius, don't you know that it will be discolored?

A. If it is subjected to smoke and dirt, it will be discolord where-

ever it is.

Q. There is more or less smoke and dirt in a large city, any way you can fix it.

A. There is some in different localities, more than in others.

Q. You think this planing mill will be ruined. Will you tell us what operation or what process of manufacture would be interfered with by this railroad?

A. The dirt and smoke coming from passing trains would, in summer time, when it is necessary to have the windows up, blow

all through the mill, and blacken the lumber in process of manufacture.

Q. What effect would that have upon the operations of the machinery?

A. It would depreciate the value of the product you are working on, whatever that might happen to be.

Q. What other effect would it have?

A. It would darken the mill.

O. Do you see any difficulty in having screens on the windows there?

A. I don't know but you might have screens.

Q. Do you see any difficulty in having the windows on River street closed, and having open windows on the other side?

A. I do.

929

Q. What is the difficulty of that? A. You could not get a circulation.

Q. You could not get a circulation on three sides?

A. Not at all times; if the wind were blowing from the river side

you would not get much of a circulation.

Q. Suppose they exercised some care about that, could not they reduce the injury that would come from the smoke and the cinders to a minimum, so that it would not amount to anything of any consequence?

A. I don't see how they could. Q. You never operated a mill? A. No.

Q. All the experience you have had is down there, in and around an open yard?

A. That is not all the experience I have had.

Q. As far as the railroad is concerned, that is all the experience you have had?

A. Yes, sir.

Q. And there are no walls or buildings to protect the yard 930 from the soot and the cinders?

A. That is true, but rough lumber will not damage as dressed lamber will.

Q. Is it not the other way, that rough lumber is damaged the most, because it is not smooth and the dirt can - blow off of it?

A. That is not the case. A little particle of soot on a fine dressed board will make a mark clear across it and ruin it.

Q. Is not this the fact, that you take undressed lumber, the soot and cinders work into the fibers of the lumber more than they would into a planed board?

A. No, sir, that is not so.

Q. You think it would adhere more quickly to a planed board

than a rough one?

A. So far as the soot is concerned the planed board will take that quickest, but as far as the cinders are concerned the fibers on an undressed board will catch those and hold them longer.

Q. Who told you that the grade would be 52 feet to the mile

right up to the Backus property?

A. That is the understanding I have had of it.

Q. Don't you know that the place where the grade is 52 feet to the mile is from Twelfth street west, to come up high enough to get from Twelfth street?

A. I don't understand it that they reach the height until they reach a point halfway between Twelfth street and the Backus

property.

Q. Don't you know that they have got to got up so as to go from Twelfth street 13 feet in the clear?

A. I don't know how that is.

931 Q. And so you assume that the grade is 52 feet to the mile almost to the Backus property?

A. No; I assume that they do not obtain their height until they get to a point halfway between Twelfth street and the Backus property.

Q. In answer to Judge Chipman you testified that one of the things that influenced your judgment was on account of the grade?

A. I was in the court-room yesterday and I heard the same thing.

Redirect examination by Judge CHIPMAN:

Q. You say this dust is explosive, like powder?

A. Yes, sir.
Q. You answered me that it lay on the ground and you touched fire to it and it ran like powder?

A. Yes, sir.
Q. You mean it is explosive, like powder when it is confined?

A. Yes, sir.

Q. In regard to inspecting and handling lumber at that mill, where is that done, inside or outside?

A. Outside.

Q. So that there would be no walls or anything to protect it?

A. No, sir.

Mr. Baker: Do they inspect it before it is unloaded?

A. It is inspected before it gets to the mill, and it is inspected after it is taken out.

By Judge CHIPMAN:

Q. It is inspected before it is put on the cars to ship?

A. Yes, sir.

932 Q. You mean they inspect to see that the lumber delivered of the grades is in accordance with the orders, to see that they are delivering the article that is ordered?

A. Yes, sir.
Q. How much of a light does it require to do that?

A. It requires a good light.

Q. A bright light, does it not? A. Yes, sir, and daylight, too.

Q. The more light the better you can do it?

A. Certainly.

By Mr. BAKER:

Q. Is there enough light in the mill now to do it?

A. It is not done in the mill.

Q. Whereabouts?

A. Outside.

By Judge CHIPMAN:

Q. Unless you have a bright light, can you inspect this timber properly?

A. No, sir.
Q. I want to ask you about that yard, what is there at that yard at Eighteenth-and-a-half street to discolor the lumber besides the trains?

A. The weather.

Q. What is there down at that yard?

- A. There is smoke and the weather, the only things that I know of.
- Q. You say that ordinary lumber piled up and covered does not discolor when it lies in the pile?

A. Take it away from the railroad.

Q. I mean in a place like that, where Backus' yard is?

A. Let me understand the question.

933 Q. My question is, what is there to discolor the lumber in Backus' lumber yard besides the locomotives?

A. There is nothing.

Q. I understand you that the only part of a lumber pile which the weather is apt to affect are the top boards?

A. That is all.

Q. The roof, so to speak?

A. That is all.

Q. How does it affect it? A. It turns it a dark color.

Q. The action of the sun? A. Yes, sir.

Q. It acts the same on the top of the roof of an old lumber pile as it would on the top of the roof of an old shed, which we see every day?

A. Yes, sir, and the covering boards of the pile, after they have been used on one pile, they are put onto another, so that you keep

the same ones as far as possible.

- Q. What is there in the mill property there, in the place where they inspect the lumber to deliver to the cars, when they are shipping it, what is there to discolor and dirty it there, as it is now situated?
 - A. There is nothing there to hurt the lumber as it is now. Q. What part of the building do they ship it from?

A. From the River Street side.

Q. How do they ship it on the River Street side?

A. It is taken outside.

Q. How?

A. In carts.

Q. On the Central Railroad side—what do they ship out with?

934 A. It is taken into the car.

Q. Is it inspected in each case?

A. Yes, sir.

Q. When it goes out by carts and when it goes out by car?

A. Yes, sir; it is loaded from the machine onto a cart and taken out doors in order to get light so as to see that the grades are correct; and loaded in the cars or on teams as the case may be, to be taken away.

Q. It is inspected in that locality where it is taken out?

A. Yes, sir; right outside of the mill.

Recross-examination by Mr. BAKER:

Q. Do you testify that there is not light enough in that mill as it is now situated to inspect it inside?

A. That is right; yes, sir.

Q. After you have put the lumber through a planing mill, you put it onto a cart and take it out into the open air before you inspect it?

A. In almost all cases.

Q. Do you not, when you take it to the Michigan Central, to a car that stands on the side track there?

A. Yes, sir.

Q. Is there not a roof over the entire premises up to the side track?

A. On the Michigan Central side there is a roof over that part of the yard not occupied by the track.

Q. Do you inspect it in that open shed that is under a roof?

A. There is a shed that is filled with skylights, and a part of it is inspected under there.

Q. Do you mean near the Fort Street end of the property?
A. No; I mean on the Woodbridge Street side.

935 A. No; I mean on the Woodbridge Street side.
Q. Is that where you load onto the Michigan Central?

A. Yes, sir.

Q. And it runs along the east side of the main building?

A. Yes, sir.

Q. Is there light enough in that shed to inspect lumber?

A. There is all there is; we have to get along with it.

Q. Is there enough?

A. They get along very well so far as I know.

Q. Would there be enough upon the River Street side if there was a similar shed?

A. That would not be similarly located.

Q. What is the difference?

A. Different kinds of lumber go in different localities.

Q. If you can inspect lumber on the east side under a shed, why can't you on the south side?

A. Some kinds of lumber are harder to inspect than others. It is harder to get them correct.

Q. You take lumber into the open space on the south side of the mill so as to get daylight, and you do not inspect it until you get it there?

A. In some instances it is inspected under the sheds, and in some

instances it is inspected on the Woodbridge Street side.

Q. Will you tell us how the elevated railroad will affect the in-

spection of lumber in that mill?

A. The smoke and the dirt settling down from the trains in passing, while a person is inspecting dressed lumber on the Woodbridge Street side, would smear it all over.

Q. You do not mean to testify that the inspection of the lumber

in the mill itself will be affected by the elevated road?

936 A. It is not inspected in the mill.

Q. So that you will have it out there in broad daylight when you do inspect it?

A. Yes, sir.

Q. And it will be inspected between the elevated road and the mill, with daylight to the zenith.

A. I don't know whether it will be daylight there or not.

Q. I suppose you assume that there will be a constant cloud hov-

ering over that place?

A. I don't know; I do not assume anything of the kind; I know there will be a cloud whenever a train passes, and there will also be a cloud from the structure itself.

Q. How much difference do you think it would make a year in the inspection of that lumber?

A. I could not tell you.

Redirect by Judge Chipman:

Q. You speak about the inspection alongside of the Central road. The mill is built to run that product there?

A. Yes, sir.

Q. It is arranged for that purpose?

A. Yes, sir.

Q. In order to do it differently, they would have to change the arrangement of the mill, would they not?

A. Yes, sir.

By Mr. BAKER:

Q. The elevated road will not prevent them from doing it; there will be room left?

A. There will be space enough.

937 WILLIAM H. MALTZ, sworn for respondents.

Examined by Judge Chipman:

Q. What is your business?

A. I have charge of the cleaning and repairing, assistant to George Sutherland, of the Michigan Central railroad.

Q. Cleaning and repairing cars?

A. Yes, sir.

Q. Do you know about the collection of cinders on cars?

A. To a certain extent, yes, sir.

Q. What about it, trains that come in, freight or passenger? A. I have nothing to do with freight. All I am of is passenger.

Q. Confine yourself to the passenger cars?

A. I find on a great many cars that come in, the platforms are covered with cinders.

Q. Do you find any cinders inside?A. Yes, sir, to a certain extent.

Q. That is a very common thing, is it not?

A. Yes, sir.

Q. Are you at the depot in this city?

A. Yes, sir.

Q. Do you know anything about the F. & P. M. trains?

A. Yes, sir, I have the cleaning of those trains.
Q. What about the cinders on them?
A. They have a certain amount of cinders on their platform and on the inside of the cars.

Q. What about the D., L. & N.?

A. I have nothing to do with them.

Q. Do you know anything about the cushions being on fire inside of passenger coaches?

938 A. We have had them come in that had holes burned in them.

Q. From the cinders?

A. I could not say.

Q. That was your supposition, was it?

A. That I could not swear to. I would not say whether they were burned by cinders or cigars.

Q. How do you account for it?

A. I have found them burned in coaches, and we merely make a report that they came in burned, but whether caused by cinders or from a lighted cigar, I could not say.

Q. Do they throw lighted cigars about in passenger coaches?

A. They do occasionally.

Q. Do you know of a car coming in within a day or two on fire?

A. Yes, sir.

Q. What road was that on?

A. On the Michigan Central, Canada division.

Q. What kind of car was it?

A. A second-class passenger car.

Q. Where was it on fire, on what part of the car?

A. On the end, a projection under the hood.

Q. The hood is the projection on the front of a car?

A. Right over the platform.

Q. The fire was outside of the car and under this projection? A. Yes, sir.

Q. How much of a fire was it?

- A. It burned out about three feet square of the lining underneath the hood.
 - Q. Was that lining inside or outside of the car?

A. Outside; it burned in under the roof. 939

Q. What became of that car?

A. We cut it off at Detroit and sent it to the shop.

Cross-examination by Mr. Baker:

Q. Where did that car come from?

A. From Buffalo.

Q. Used as an immigrant car? A. It was a second-class car.

Q. Was it an old car?

A. It was just after being overhauled; probably four or five years old.

Q. How did it catch; any place there for it to catch in?

A. Not to any extent. There was not anything there, but it must have worked up into a corner, probably a crevice about the 32d part of an inch.

Q. Was that a painted part up there? A. Yes, sir.

Q. Of course you don't know where it caught fire?

A. Our reports came back that it caught fire about 18 miles this side of St. Thomas.

Q. Was this car loaded with passengers?

A. Yes, sir.

Q. Did the engine come across the river?

A. No, sir; it stopped at Windsor.

Q. Which road has the most cinders on its passenger cars, the Michigan Central or the F. & P. M.?

A. I never made it my business to examine and see which did

have the most.

Q. Can you tell?

A. At times we would find as many on the F. & P. M. as on the Central.

940 Q. You do not usually find as many on that road?

A. I cannot say as we do find as many on the F. & P. M. as on the Central.

By Judge Chipman:

Q. Do you know anything about the engines on the Central having spark-arresters?

A. I understand that on the Canada division they have spark-

arresters.

Q. Do you know anything about that?

A. I do not.

By Mr. Charest:

Q. When you find a cushion with a hole in it, do you find the stub of a cigar there?

A. No, we do not find the stubs of cigars.

Q. What makes you say it was caused by the stub of a cigar? A. Sometimes we find where a window sill had been slightly burned, the ashes of a cigar lying on it.

Q. In first-class cars?

A. Yes, sir.

By Judge CHIPMAN:

Q. Do you wish to have this jury understand that every time you find a cushion burned you find traces of cigars?

A. No, sir, I do not mean to say that.

ABSALOM BACKUS, JR., sworn for respondents.

Examined by Judge Chipman:

Q. How old are you?

A. Nearly 67.

Q. How long have you lived in Detroit?

A. 24 years.

941 Q. How long have you been engaged in business here? A. The whole time, 24 years.

Q. You commenced business here in 1868, did you not?

A. In 1867.

Q. Are you the owner of this property known as the A. Backus, Jr., mills?

A. I am.

Q. The property in controversy here?

A. Yes, sir.

Q. How long have you owned that property?

A. It was purchased in 1871, most of it.

Q. How much land have you where your mill is?

A. About 13 acres.

Q. How much front on River street?

A. 238 feet 6 inches.

Q. Where does it run to from River street?

A. It runs to Fort street.

Q. How much front has it on Fort street?

A. I don't know exactly, it is in the neighborhood of 75 feet, it is about 318 feet from street to street.

Q. Will you tell the jury what you have on that property?

A. Our plant consists of the planing mill proper, the lower mill, our dust-room, shavings-room, four dry kilns, our boiler-house, engine-room and sheds on the side of the Michigan Central, running the whole length, 200 feet, in which we store about 15 car-loads of worked material, next to the track.

Q. You also have an office building?

A. Yes, sir.

Q. What is that plant worth, without the real estate?

A. It is worth all it has cost. It could not be built today
942 any cheaper than we built it. The material would cost
fully as much, the labor would cost more, and brick would
cost more.

Q. You have not told us how much it was worth?

A. It is worth \$150,000, and I want to show you why it is worth

that. That includes everything outside of the real estate. I can give you the details of it.

A JUROR: Does that include the stock?

A. No. Sometimes there might be \$25,000 worth and sometimes \$50,000 worth of stock.

Q. This estimate is exclusive of any stock in the mill and exclu-

sive of the real estate?

A. Yes; that is absolutely the cost, dollar for dollar.

Q. What is the value of that real estate?
A. There is such a variation in the opinion of people, but I will tell you how I have looked upon it.

Q. What do you value it at?

A. I value it at \$150,000, I mean from Woodbridge street to Fort street.

Q. The real estate?

A. Yes, sir; we talked it over nine or ten years ago. Q. What did you pay for it when you bought it?

That was before the excavation was made, when A. \$35,000. there was a bill.

Q. Before the railroads were there?

A. No, the Michigan Central was there, the main tracks, before our branches were there.

Q. In order to erect your works and put your plant there, what

did you have to do?

A. We had to excavate a hill that cost us something over \$8,000 at the start, and afterwards we bought another field and it cost us over \$1,000 to get that; the excavation cost us something over \$9,000.

Q. To excavate it and get a bottom on which to put your 943 plant on a level with River street?

A. Yes, sir.

Q. Did you have to put in a stone wall?

A. We built a stone wall the whole length of the building between us and the Michigan Central.

Q. What did that cost you?

A. We built it two or three different times; it is about 4½ feet thick.

Q. What did it cost you?

A. I could not tell you. A good deal more than \$1,000.

Q. Have you any piping there?

A. We laid a pipe to the river. That job cost us over \$3,000.

Q. What was the object of that?

A. So that we could get the water independent of the city. We pump our own water from the river.

Q. What was the condition of the Michigan Central property

there at that time; was elevator B built then?

A. It was built about that time. I think there were two main tracks down the Michigan Central at that time. They now have six main tracks.

Q. Will you tell the jury what your plant is composed of as regards boilers?

A. Our power consists of four boilers, and the engine we bought of Hodges & Company, 24 by 36, balance-wheel 15 feet in diameter, which gives us about 250 horse-power net.

Q. You have four boilers and a 250-horse-power engine?

A. Yes, sir; five-inch shafting running 60 feet and branches each way, one shaft 110 feet and another 80 feet long. This structure is built very substantially, and it is not like other people's. It is peculiar in itself, in the arrangement; it was built for a purpose.

A JUROR: Why is it not like other people's?

A. It is built a little different—a different plan, for instance; I will make it plain to you before we get through; I have got a better plan, and you may go through the United States and you won't find its equal. My pipes that carry my shavings are laid in the ground. There are three of them, 110 feet long, 32 inches in diameter, made in a substantial way, lined with iron, and my fan is at the end of that. I take my shaving pipes under the floor. I never saw one anywhere else. There are a hundred things about the place that I can explain to you different from anybody's else.

Q. In regard to these engines and boilers, what kind are they as

to power?

A. They are steam boilers. James McGregor built them, 54 3-inch flues in each boiler.

Q. What is the length of the boiler?

A. Fifteen feet.

Q. Are they a good article? A. The best of the kind.

Q. What in regard to your engine?

A. We had it made especially, after asking for bids of the Corliss engine and other places, and we had it built here in town.

Q. What is it as to quality?

A. We call it first class. It is not as expensive an engine as the Corliss, but it is a good engine, what is called a riding cut, flat-valve engine.

Q. How many moulding and planing machines have you in that

plant?

A. There are five double-cylinder, sectional pressure, cylinders 30 inches long. Those are simply for dressing lumber on two sides, and they are so arranged that they will dress two boards at a time, a thick board and a thin board both, equivalent to 70,000 feet a day.

Q. What is the total number of those machines?

A. Five of the largest.

Q. How many planing machines have you, all told?

A. Nineteen machines.

Q. Nineteen planing machines?

A. Yes, sir.

Q. Describe the uses of those machines to the jury. Five of them plane boards on both sides. Now, what about the others?

A. Three of them dress four sides, used as planers and matchers, tongue and groove and dress both sides, that would make nine.

And then there are three moulding machines, that makes 12; and then there is a jointer, a machine that you can take a piece of lumber out of line and straighten it, that makes 13; and then there are six hand matchers, that feed the lumber from the machine by hand, which rabbet and do very nice work. Those we use to tongue and groove our box-work upstairs, and when the machines are in order, we are able to do very nice work; we glue the joints and make very nice work.

Q. He long have these machines been in use in your mill?

A. We bought them when we built the mill, eight years ago, but there is not a machine there today that is not in as good order as when it was put in. There is one man who does not do much else except to keep them in order. He rebabbitts them and keeps them in trim.

Q. Have you any small matchers and joiners?

946 A. Six, and they make up the 19. There is other machinery.

Q. How many gangs of rip-saws have you?

A. Three gangs where we do car siding and roofing, and then we have what we term a Chicago saw that works by power, practically through gangs.

Q. How many rip-saws have you, all told?

A. Probably 40, cut-offs and rip-saws.

Q. How many what you call resaws, for cutting the board in two?

A. To resaw and make two boards of it, we have four, but there are three in use.

Q. Have you any cross-cut machines?

A. That is what I have referred to; probably 40 saws, 20 of them cross-cuts and 20 rip-saws.

Q. What other fine machines have you there?

A. There is our mitre saw, one small pony planer, a boring machine, gig-saw, perhaps more. Clapboard machines—we dress our lumber on four sides and pass it through the machine, and it saws it on a bevel, making two pieces; one edge is thick and another is thin.

Q. Have you elevators there?

A. We have two elevators, one 21 feet long by 10 feet wide, made very substantial and very strong. That is one of Backus' machines. It has run now for eight years without any repairs. We wore out one every 30 days, and it was a nuisance until I went at it and got mad and built a new machine, and it is there today, just as good as it was the day it was put in. And there is another 12 feet square, used to fetch the lumber down. It comes back by a counter-weight, with two men and six or eight empty trucks on.

Q. Have you any scales?

A. We have scales to weigh all our lumber before it is shipped. It goes onto a scale, and it is weighed.

Q. Anything else that you want to describe in the way of

machinery?

A. There are two elevating bunks that you saw which carry lumber up. It is beyond a man's comprehension how much work

70 - 55

it will do. It will do more work than you can imagine it is possible to do. It will carry 20,000 feet of lumber up four stories high and deposit it on the platform, and one man swings it around on these trucks.

Q. You have a pneumatic apparatus and fan?

A. A pneumatic tube that carries our messages to the office and brings messages and orders back, so that we put our orders into a little cup and whisper through to the mill, and it is set going by moving a lever.

Q. Saves you walking and running backward and forward?

A. Yes, sir.

Q. Have you anything else?

A. We have electric bells and speaking tubes that reach from the office to the mill.

Q. All these things cost money?

A. They cost a great deal of money, and yet they do not show.

Q. Have you telephone apparatus there?

A. There are several telephones in the place.

Q. How many, do you know?

A. Four or five.

Q. Have you dry kilns there?

A. We have five dry kilns, four of them of the capacity of 60,000 each, 240,000 feet, and the other is 20,000, making 260,000 of lumber at a time.

948 Q. What about this exhaust blower?

A. We have an arrangement that we have used, but we have discontinued it for the present.

Q. Have you a number of emery grinders?

A. Yes, sir.

Q. What are they used for?

A. One large emery grinder stands in the engine-room, and is used to grind our planer knives. That is under the supervision of the engineer, and it is automatic in its working. It grinds back and forth until it grinds to a certain point and then it stops; and then there are several smaller emeries which we use to make our moulding knives. The improved kind of moulding knife is something that requires a good deal of care, you cannot see to do that without bright light. They have to be made to a pattern. That is one of our specialties. We do fancy work; when we got an order from New York for fancy work, for inside finish, we work to patterns, and we have to make our own knives.

Q. What kind of floors have you in that mill?

A. The flooring on the mill in the three upper stories is two thicknesses, inch and a quarter pine, an inch and a quarter maple on top of it. The floors are smooth and solid, like an office floor, so that we can move heavy loads anywhere. The mill is built in the most substantial manner, so that it will carry a hundred tons weight anywhere. It stands upon substantial foundations.

Q. How many trucks have you?

A. Something over 200 in the mill. Trucks and boxes for carrying the stuff away. They are all on casters.

Q. How many traveling belts?

A. Two, to carry lumber from the first floor onto the upper floors, and their capacity is beyond a man's comprehension-20,000 feet an hour, as fast as they can put in two or three boards at a time. It travels 200 feet a minute.

Q. Have you canvas hose and stand-pipes?

A. Eight hundred feet of canvas hose for fire protection, in working order and can be put in operation instantaneously.

Q. And stand-pipes-for the same purpose?

A. Yes, sir.

949

Q. Have you steam pipes running through the building to warm it?

A. On every floor.

Q. Have you fire on any floor?

A. No fire in the place.

Q. I see you have some force-pumps, what are they?

A. Three force-pumps that can be used for fire purposes, in addition to our stand-pipes to carry our city water; we pump water directly from the river, and we use pumps.

Q. Two large water tanks, what are they for?

A. One of the tanks is made of iron and receives the condensation after the exhaust from our engine goes through the dry kilns. It condenses and comes back in water. Of course, that is distilled water. That is free from lime or any other impurities, and it is worked over in our boiler, pumped from them into our boiler constantly; and there is a large tank from where we get our supply as we pump it from the river.

Q. So that by that arrangement you get water which is perfectly

free from impurities, so as not to foul your boilers?

A. Yes, sir. If by any mishap anything should occur, that we are disabled in our machinery, we are connected with the city water works so that we can get an instantaneous supply.

stand-pipes come from the city water works and are also con-950 nected with our own pump. We have an arrangement by which we can flood the inside of our shavings-room in case we

should get on fire.

Q. You are doing the best you can to keep down fire?

A. Yes, sir, that is what we have always done.

Q. That is your greatest enemy?

A. Yes, sir, we burned up there eight years ago.

Q. How much did you lose in that fire eight years ago?

A. More than \$100,000 above all insurance. Q. I see there eight miles of steam pipe?

A. Yes, sir.

Q. What about that?

A. That is absolutely so. We have figured them up and there are over eight miles. We have probably more of steam fitting in our place than in any other place in the country. We are amply provided so as to warm our place like a parlor in the winter time. Every room in that mill is warm and comfortable.

Q. These steam pipes are to heat the dry kilns as well as the mill?

A. Yes, sir.

Q. They are used for both purposes?

A. Yes, sir.

Q. There are shaving tunnels in the ground under the floor?

A. Those tunnels are built of two-by-four scantlings run through a moulding machine and laid so that they are round, and iron hoops made of half-inch iron, and those hoops are placed once in thirty inches. The pipe is 32 inches at one end and 18 at the other, 110 feet long, and I had a man go inside and line them with iron. They are Backus' arrangement. It does better than any one's else. It is perfect.

951 Q. You have three of them?

A. Yes, sir. We are never bothered with its clogging, it always goes, and then these fans stand in the ground, and they fetch the shavings up into the shavings-room, and our sawdust in the same way. You get onto the idea that I am a little different than anybody else, but I get the best arrangement. Other people have their pipes overhead to catch the dust and obstruct the light and to be in the way of the belting. Mine are in the ground out of the way. I can do anything I want to do. I can dress up a white-oak plank that is green and all ice on it. Other folks have to stop and shut down the machine and poke to make it go. These things cost money but it pays better to do it.

Q. I see there is one roll machine?

A. That is a machine to make rollers. We can make rollers three inches in diameter, or we can make curtain rollers $\frac{3}{4}$ of an inch, $1\frac{1}{2}$, 2 inches or $2\frac{1}{2}$ in diameter. That is a specialty of ours. When we find a customer who wants something of that kind we are able to make it.

Q. I see you have a railroad siding?

A. Yes, sir, 500 feet of it. Q. Who pays for that?

A. They put the iron down, and we paid for everything else.

Q. Gig-saws, how many have you?

A. I think there is only one. Q. Reservoir for shavings?

A. There is a reservoir for shavings probably 40 feet long, 20 feet wide and 20 feet high. That is the size of our present shavings-room.

Q. What about your reservoir for sawdust?

A. The sawdust has a room 40 or 50 feet long, 20 feet wide and some 30 feet high. It is very high. That is where the sawdust comes in.

Q. A wood-cutting machine?A. No, that is on the fourth floor.

Q. Have you one there?

A. We have a saw for cutting up wood and a traveling belt that carries it into pockets, where we can sell it—give a man a load of wood in a minute.

Q. Have you sewers there?

A. Sewers in every direction, laid wherever it is necessary.

Q. Is the ground thoroughly and well sewered?

A. Yes, sir.

953

Q. Have you all the belting, tools and small machinery to accom-

pany such an establishment?

A. Yes, sir. We have idlers to carry our heavy belts. When we stop a machine everything stops about it, and our belting there is double belting. We run our planing machines with eight-inch belt, double, and it is run with a tightener, and when we shut off a machine this whole thing stops. It does not travel and make a noise. That cost us \$55 each set, and I think there are 12 or 14 sets.

Q. Have you all those appliances that I have mentioned?

A. Yes, sir, and probably a great many more. The half is not yet told.

Q. Have you underground pipes to convey the heat to the kilns?

A. Yes, sir; there is a pipe made of galvanized iron, 30 inches in diameter. It must be nearly 100 feet long.

Q. Sheds for keeping your stock dry?

A. The sheds stand on iron columns. The columns, I think, cost us about \$500 for those sheds. There are a great many of them.

Q. Platforms all around the railroad track?

A. Platforms and paved yard, paved with cedar blocks, and sewerage so as to carry the surface water off the yard to keep us dry always.

Q. Have you an office building?

A. We have an office that is comfortable, 32 by 40, two stories, 15 feet between joists.

Q. A pretty fine office?A. I will leave you to say.Q. Vaults in your office?

A. Vault to keep our papers, and a burglar-proof safe without any money in it.

Q. Have you carpenter and repair shops?

- A. I have got a place set apart for a carpenter shop, nicely warmed with steam pipes, bench and tools, and most anything that is wanted.
- Q. About what is the capacity of that mill, the daily capacity?
 A. I could not tell you. We never have had work enough to fill
 it. We could work up 300,000 feet of lumber in a day if we had it.

Q. What do you average?

A. We probably average 75,000 to 80,000 feet. 100,000 feet would be a fair daily average, if we could get the work, if we were supplied with the work.

Q. On an average, how many people do you employ in that mill?

A. Our pay-roll, I think, is about 130, but we probably average about 150 the year round.

Q. All these items which you have gone over here to the jury

have cost you money?

A. They have been done with as much economy as we could study to get that which was good. In addition to that, we have a yard at the foot of Eighteenth-and-a-half street, and we have a great many trucks and horses, and everything in good order to do business.

Q. All to run in connection with this mill?

A. Yes, sir.

Q. I want to ask you what you manufacture? A. We manufacture anything that we can sell.

Q. I want the jury to get some idea of your business.

A. Flooring, clapboards, ceiling, moulding, wainscoting. not make sash and doors. With blinds, we confine ourselves to getting out coarse material. We sell to retail yards throughout the country anything that they ask for-pickets, easing, car siding, cornice; car siding is one of our specialties. We work for a great many car companies—panel stock, pattern and finishing lumber and box chutes, racks for different purposes.

Q. Box chutes is one of your main products?

A. That is our main hold. We got an order Monday for four car-loads coming in from A, B and C from all over the country.

Q. Water tanks?

A. Yes, sir, for railroads.

Q. Pickets? A. Yes, sir.

Q. Tub and pail stocks?

A. Yes, sir.

Q. Stretcher stock—what is that?

A. That is used for a variety of purposes. When they work split leather, and make three or four or five thicknesses, they have these stretchers to stretch it out.

Q. Backing for picture frames?

A. Yes, sir; we try to accommodate almost anybody.

Q. Sign-boards?

A. Yes, sir.

955

Q. There is a great variety of stuff manufactured there?

A. Yes, sir; in all kinds of wood, hard and soft. Q. You do a great deal of very fine work there?

A. Yes, sir, and we try to do it in such a way that when we send it away people will be satisfied, so that they will trade with us again.

Q. Do you recollect how much your dry kilns cost?
A. I can only approximate. They probably cost us \$10,000. That mill, with the machinery, shows that it has cost us, dollar for dollar, \$116,000, that is for the mill alone. Our office account foots something over \$15,000, including the furniture and fixtures. You noticed the wall was covered with Lincrusta Walton, very nicely decorated. We had three men working two months decorating.

Q. Does that include the warehouse?

A. No, sir.

Q. How many dry kilns?

A. Four proper and one over the boilers, making five. Those four dry kilns, we know, cost us more than \$10,000.

Q. You have been laying out money on that mill ever since you

built it?

956

A. Yes, sir. Q. You built it about eight years ago?

A. Yes, sir; our plant cost us \$150,000. It is made up of \$116,000 for the main mill. \$10,000 for the dry kilns, \$15,000 for the office, \$3,000 for the water pipes, that makes \$144,000. Then there is the labor of two men, for a good share of the time, for eight years, re-

arranging, setting up machinery, making changes, and that has always been charged to the expense account, which

should properly be charged to construction account.

A JUROR: You have to allow something for wear and tear? A. We keep it up with these two men making changes.

Mr. TRAUB: We consider it worth quite a fortune to be situated at prominent railways to make signs for the 'ravelers to notice, and thus save a great deal of money advertising in the papers. know that Mabley probably spends \$20,000 a year in advertising?

A. We never advertise in that way. The money that we spend is by making a personal application. I go and tire a man out by talking to him. I blow my own horn and he always gives me an order to get rid of me. I do not advertise, but I keep our machinery in good order.

Mr. TRAUB: You are so conveniently arranged that the trains passing you—the people can see you without advertising in the

A. That does not amount to much. We advertise by making special effort, getting acquainted with the men and using them so well that they will never leave you. I have men on my books that have been there 15 years right along. You could not buy them off, you could not scare them away with a club. I want to state this. that way back in the year 1870 I established the precedent of making box chutes and shipping them to the eastern cities. I was the first man to make box chutes and ship them east, and they gradually worked up an extensive trade. I didn't know enough to keep the business to myself. I built a large mill in 1871-'72-built that mill that was burned down, and the press thought it would be

a very nice thing to write me up and I gave myself away, and 957 from that time forward I began to have competitors, and probably in a year I had 30 or 40 competitors; probably 50 or 60 doing the same class of work, so that it is not always wise to Mr. Adams told me I was making a great mistake when I put the new engine into my planing mill. He says, "We are taking out a 16-inch cylinder and putting in a 12, and you are putting in a 20 by 26." Later on I had to take that out and put in a 24 by 36, and we never had any too much power ...

Q. Is the planing-mill business a business in which much adver-

tising is done?

A. No, sir.

Q. Do you know of any planing mill in the city of Detroit that advertises?

A. I never advertise any. Q. Can you tell me of any?

A. I could not.

Q. Business is done with builders, or men around town here?

A. Our business is largely abroad.

Q. But I mean in town here, it is done right with the builders?

A. Yes, sir, they come right and see it themselves.

Q. And for the business abroad advertising in the city here would not do you any good?

A. No, sir.

Q. Mr. Adams, in his testimony here, undertook to criticise your ways of doing business. I will ask you, now, have you made a success of your business?

A. From Mr. Adams' standpoint I have not, but from my stand-

point I have.

Q. About what are you making a year out of that mill?

A. If that is a pertinent question, I can explain: Some years we have done very remarkably well, and some years 958 we have not done so well, but we have always held our own.

Q. About how much have you done; I see in your testimony

before you told it?

A. There are years we have made very nice money; years ago.

Q. How much, \$75,000?

A. Yes; \$70,000, \$56,000, \$35,000, \$30,000, \$25,000, \$52,000, \$70,000. But there are years when we have had to work very hard to make our living.

Q. Have you paid for that property out of the mill itself?

A. I can say that in our fire, 1882, we lost more than \$100,000, and today we have just about caught up, I guess. Q. You have a storehouse on Fort street? A. Yes, sir.

Q. You have also seven acres of land down the river there?

A. Yes, sir, Eighteenth-and-a-half street.

Q. Mr. Thompson thought perhaps your yard was a little too far from your mill?

A. Yes, sir.

Q. Just tell us about that; tell us what it costs you to handle your lumber there, and how many teams, compared with him.

A. We handle probably 20,000,000 feet of lumber a year, and I think our horses are 14, if I am not mistaken; but there are four of those that we might consider fancy horses; that is, we drive them in our phaeton; that would leave us ten horses to do our business. Mr. Thompson, I think, as I have been advised, has 34 horses; we have ten to do our work.

Mr. Baker: He testified that he had to do that work. A JUROR: How many do you use between the yard and the mill?

No answer to juror's question.

Judge CHIPMAN: Two horses to haul those trucks in the yard;

that was the testimony.

WITNESS: Mr. Thompson is delivering lumber; he runs a yard here in town and handles a great deal of lumber, and has got a great many horses.

Mr. BAKER: He testified that he used two horses down there to

supply his mill.

Judge CHIPMAN: I speak of the number of horses that you use

and that he uses in your lumber businesses.

A. We have to bring most of our lumber by water, nineteentwentieths probably is brought by water; I have been looking over it this morning; one-twentieth comes in by rail, nineteen-twentieths by water; it is landed on our dock; it has to be sorted up in qualities, in thicknesses, widths and lengths, and it has to be piled, number 3, 4, 5, and so on; by actual count on our yard we have 611 piles 18 feet wide to pile this lumber, and it is sorted into ten-inch. into box quality and other kinds to put into the respective piles; and we have what we call Mormon trucks, we have 26 of them; Mr. Thompson says he has 150; we have 26; these Mormons consist of two wheels four feet in diameter, with four-inch tread, and an axle in here, and rollers on it, that rests on a little, small truck, with two wheels, that is hitched to a tongue, and we hitch onto one or more trucks, and we call them Mormons because one will marry on them all. Now, here is the lumber left on the dock, 15 or 16 feet high, running here for 300 or 400 feet, and we have a plank run-

ning here, and these trucks will come here, and we set a three-wheeled bench under the end of this truck; here is 26

of them along here in a row, and the man who is on top of the pile sorts the pile, and he marks them. Here is No. 3, 4, 5, or according to the quality, and the men take hold of this lumber: this is select lumber, that goes to that truck; this is fine common, that goes to that truck, and so on. They handle 150,000 or 200,000 feet in a day. Mr. Thompson uses two horses, Mr. Backus uses two horses, but Mr. Backus can get away with more lumber than Mr. Thompson can; with these two horses, driving them together, hitching onto this, he moves 100 loads in a day and distributes it-it will average from 1,200 to 1,500 feet to a load—and he takes this load and goes off to that pile—there is seven alleys—and he drops it here and there; the man who is driving goes to work to take this lumber, and he will get away with 100 loads with this one team. We have to have a place to sort and store this lumber. Mr. Adams' idea is to have his mill and lumber together; Mr. Backus' idea is to have them separate.

Q. Mr. Thompson you mean?

A. Mr. Thompson and Mr. Adams both; I wanted to get into the city where I could distribute my stuff and sell my kindling. Backus delivers seven loads of boxes to his customers each day; Mr. Thompson delivers two. Mr. Thompson's way is all right; Mr. Backus' way is all right.

Q. Mr. Thompson said that if you could handle that lumber for

ten cents a thousand you could handle it very cheap?

ممصدا

team.

A. Yes, sir.

Q. How much does it cost you to handle it?

A. It probably costs eight cents a thousand to put it on the truck; there is a man on the pile and another man on 961the truck, and there is about six to eight men used to load these trucks all the time. They understand how to do it. This man on the truck knows how to take this lumber. So it probably costs us eight cents a thousand to put on those trucks; if we put it on a car it would cost us twelve cents. The labor of taking this lumber from this place to the mill is about ten cents. The teamster himself never loads or unloads, we dump the load; we take from 2,500 to 3,000 or 4,000 feet to a load, and the teamster drives up and backs up in behind the machine, and the man at the machine, or the foreman-the teamster does not attach this thing, but the man at the machine or the foreman tips a little lever, and

Q. He does not wait at all?

A. No, sir; there is no confusion, no loose men there; there is no dead flies around it, we are all going right to business. I don't know who can do it any better.

this stuff rolls off, as I understand, in half a minute or so; and he goes back and he makes from ten to twelve trips a day with his

Q. He says if you delivered from the yard to the mill at ten cents

a thousand it is cheap?

A. I can deliver on an average about 3,500 feet a day; the team and the teamster, that would be \$3.50, at 10 cents.

Q. How many teams does that take to deliver the lumber?

A. I think there is three teams employed on that—three and four; some lumber has to go to the dry kilns and be handled over twice, and we have to change around; we have to bring lumber from the dry kiln up here, and once in a while send a load up to town.

Q. Your sons are in that business up there?

A. Yes, sir.

Q. How many have you?

A. Two sons.

Q. It is a corporation now?

A. Yes, sir.

962

Q. Who are the stockholders there?

A. Myself and two sons. My two sons have a little more than half. They have got so that they have got the old gentleman tight; they can control him.

Q. You own the real estate there; do you rent it?

A. The real estate is rented to the corporation. Q. For how much a year?

A. \$18,000.

Q. For the real estate?

A. Yes, sir. That is divided, \$1,000 on the warehouse, \$5,000 on the mill, \$12,000 on the dock.

Q. The mill property, the real estate, you are getting \$5,000 a year for.

A. Yes, sir.

Q. That comes to you personally?

A. Yes, sir.

Q. As the landlord of the company?

A. Yes, sir; and they pay the taxes besides. The measure of the value can be based on that.

Q. How much are the taxes?

A. I don't know; some \$3,000, I think, on the whole property.

Q. I mean on the mill property?

A. I don't know.

Q. But they pay you \$5,000 a year for the site of the mill—and they pay the taxes besides?

A. Yes, sir.

Q. What other business have your sons been in?

A. No other business.

963 Q. Have you brought them up with this business?
A. I nailed them to the mast before they knew it.

Q. What are their names?

A. Newton Dennis and Henry Nelson.

Q. How old is the oldest?

A. Thirty-eight. Q. And the other?

A. Thirty-six.

Q. How long have they been in this business?
A. Ever since they were 16 or 17 years old.
Q. They have been in it since they were boys?

A. Yes, sir.

Q. And have been in with you ever since?

A. Yes, sir.

Q. There is a great deal said here about this dust bin. Have you any burlap in there?

A. I have got the best appliance.
Q. First, have you any burlap there?

A. Twenty-seven hundred yards of burlap.

Q. I wish you would go on and tell the jury in your own way what sort of appliance you have there, why you think it is the best; what you think are the dangers to which that machine gives rise, and generally give an account of it. Give us the shape and purposes of that dust-bin, and its liability to fire, according to the way the wind blows, and which way the wind blows down there, and all that?

A. In order to run a planing machine and make your room available, it is necessary to get rid of the shavings and sawdust as fast as it is made, and the most practical way to do that is to use a large fan, an exhaust fan, that draws the stuff from the machines

and throws it into a large reservoir, wherever it is; in order 964 to have it work properly it has get to be a large place that will have free vent; if you undertook to throw it into this room it would not come in here, it would work against itself; you have to give it a free vent; if you do not, the shavings and dust go out and that makes it a nuisance every way. It has been a great

study with everybody in this business for a great many years. I have been very much exercised over it myself; I tried a great many schemes; away back in 1873 I got a kind of an idea of blowing it in at the openings, but I never got relief until I got onto this idea gradually of burlaps, and gradually it developed into a perfect success; I took out a patent, and I have built probably a hundred of them, for some of the largest institutions in the land, and without exception they all say it is superior to anything else; many of them have been exchanged for other appliances, but they come back and say, "Backus, yours is the best." This runs automatically, requiring no power; the others require a good deal of power, and this gives us perfect relief, and free from dust, leaves the shavings and sawdust in the room where you want it. So I have adopted that. Hand me that little model there.

(The model is handed to witness.).

Q. Just explain how that burlap acts and the necessity for ventilators on the top, and the dangers you are trying to counteract?

A. Our room over there is very lengthy; it takes in two rooms as much as 70 or 80 feet long; this is six-inch board, and six-inch crap all along, and 20 to 26 feet wide, and I put burlaps 12 feet high on that place, and in all I have got 2,700 yards of burlap; the way it goes in here through these open cracks and comes out

here; the wind comes out free, because there is no pressure on it, and there is so much surface that it is like a man put-

ting his head in a woolen sack, he can breathe free; if he put it in a flour sack he could not; the wind raises it and these things puff out, swell out, and when you shut down your mill they collapse, that breaks the dust loose, and they fall down; consequently it is automatic. Mitchell & Rowland, of Toledo, use one; Sanger & Rockwell, of Milwaukee, also; Anson Eldred, of Port Howard; and the big men of Chicago, Palmer & Fuller; these large carriagemen at Fort Wayne, Studebaker, put in a large one. I have put in 100 of them in different places; the pencil-makers in New York, and the car works.

Q. Have you a patent on it?

A. Yes, sir.

965

Q. Well, go on with your statement?

A. Of all the devices that have ever been put up, that is the most substantial and reliable one; it is bulky and costs money, but when you get it in you can go to sleep nights, and think it is all right, because it will do the work. Crampton & Bolton said, when one was put in there, "When I start my fan it will crack my fan all to pieces." My man who was putting it up, said, "No it won't." He told him to wait until he started the engine, and to be very careful. He started up the engine, and this thing didn't even flutter; and he says, "All right, go ahead." That was Crampton & Bolton.

Q. Is this the size of the thing you put in there?

A. No, sir, that is a little model.

Q. How big are they?

A. In mine it is quite 2,700 yards.

THE FORT STREET UNION DEPOT CO.

Q. What is each of these divisions?

A. It is about a yard wide, 40 inches wide, and run-up 15 or 16 inches high.

Q. Have Clough & Warren, the organizen, got one?

966 Q. Have Cl A. Yes, sir.

Juron:

Q. What quantity do you gather daily in these burlaps or in the dust-room?

A. I don't know. We make in our place probably 10 cords, more

too, in a day.

Q. That would be 20 loads?

A. Yes, sir.

ANOTHER JUROR:

Q. If that was covered by a cloth, would not that work well?

A. No, sir, it would not work as well.

Q. What is your objection?

A. I should not hardly know how to do it.

Q. But I suppose it could be done?

A. Oh, I suppose it could be done, but it would be a pretty serious expense. That is not exposed there (referring to model), that is under lattice-work; the cloth is not exposed. Understand that that is not perfection; a little fine dust will creep out of this, but in such infinitesimal quantities that it will not accumulate in great quantities; still on a dry day, without much wind, they will lay on the roof; so it is exposed to that trouble we are speaking of, this exposure to the fire.

By Judge CHIPMAN:

Q. In regard to a wire cloth being put in there, what would be the objection to it?

A. It would be too expensive and too complicated?

Q. Would it be flexible enough?

A. No, sir; it would choke right up; the wire cloth would 967 not do; we have tried that; they tried it in Brooklyn, they tried it in a large place in Brooklyn; they had this wire arrangement, but it choked up; the dust will collect, and it choked up; they had the wire in place of this cloth, and it clogged.

Q. Why do you use the burlap?

A. Because it is flexible; it works just like that (illustrating); when you blow in, it will just go so; when you shut down your mill it collapses, and that breaks the dust loose.

Q. Does this burlap prevent the dust from going through? A. That is in the main, it does.

Q. Would the wire cloth do it?

A. No, sir, not so well, because it is too coarse; this is a very fine mesh.

Q. There is a fibre inside of this that catches the fine dust?

A. Yes, sir.

Q. In the burlap?

A. Yes, sir.

Q. The upper part of this dust-room is open?

A. No, sir; there is a roof over that. Q. But there are these slats along?

A. Yes, sir; on the sides.

Q. The purpose of these slats is to let the air in?

A. Yes, sir; to give a free vent; this, you understand, is in the upper part of your shavings-room, your place where you are housing your shavings and dust, that is in the upper part, overhead.

Q. The pressure would be so great that it would either take the roof off or take the dust all out of doors, if you had it closed on top;

it would be apt to take the roof off? A. You could not work it.

968 Q. If it is open, and there is nothing to obstruct the dust, it will go streaming out?

A. Yes, sir.

Q. Now, the wind, of course, according to the direction in which it blows, goes into these slats on top?

A. If it blows from this way, it works through the slats?

Q. If any dust comes out, then it will come out on the opposite side of the wind?

A. Yes, sir.

Q. If the wind is blowing in this direction, and there is a spark from a locomotive, or anything else, a live coal, and it goes in there

and touches that, it will go off, won't it?

A. I will give you a few illustrations: The Standard Oil Company built this thing in Cleveland, a very large one, 3,000 or 4,000 yards, that worked to perfection, and one day a man was a little careless and the dust fell down, the door was open, and we happened to have the doors open to the fire, and it kind of smudged right in, and it blew the whole thing up; that is one instance. the Columbus Buggy Co.'s place in Columbus, they sent a man up above to sweep it out; it was six stories high; and he swept it over, and he left his fire-door open below, that is, the ash-pit door was not closed, and that dust, as it came here, sputtered right in here, and it blew it up, and the man was burned so that he died. here in Croghan street, a few years ago, their dust business blew up there, and it came near burning them np.

Q. They didn't have any arrester there?

A. No, sir; they didn't have this, but it shows the dust is very combustible. And here out at Owosso at Crutch's place, that blew up the same way. It is almost as practicable to blow that 969 thing up as though it was a train of powder; if a spark goes

in there it has got to blow you up, and there is no fire department that can prevent it.

Q. Why did you put that dust-bin, or whatever you call it, where it is?

A. To get away from the exposure. Q. What exposure?

A. From the Michigan Central. The Michigan Central is on the east side, and I put it over as far as I could to get it away.

Q. With all these buildings in between?

A. Yes, sir.
Q. Then the danger in this dust-arrester would be, if the wind vas in the right direction, that it would bear in or suck in a spark f it came—is not that so?

A. That is true, and it is certain to work that way.

Q. And of course there is a suction there?

A. The wind is always up or down the river, that is, it is pretty near, and as it comes it will float this, if a train is coming this way, t will float it this way, and if it is coming this way it will float this vay (illustrating).

Q. Have you observed the prevailing winds?

A. I have.

Q. In connection with your mill?

A. Yes, sir.

Q. Do they blow towards your mill, or away from it—the pre-

ailing general winds?

A. The prevailing winds suck up through under the bridge, and f it is an east wind it kind of works up right through, on the Iichigan Central.

Q. In regard to this elevated road, which way would the wind be generally, as carrying their sparks and cinders and dust? 70

A. If it is an east wind or easterly wind, or southerly wind or westerly wind, it is sure to find us.

Q. It bears it in towards your building and your plant?

A. Yes, sir, east, south or westerly wind, it is sure to find us.

Q, Those you say are the prevailing winds?

A. Yes, sir.
Q. What do you consider the precise dangers and the precise etriment to your plant there by this structure being put in front f it?

A. I consider it is an absolute ruin to our business. Q. Go on and tell the jury in your own way why.

A. I don't think it would be a practicable thing for us to run it, or the reason in the first place that it would not be but a little rhile before we would be burned up; it is inevitable; because you nust remember that works like powder, it is a thing that is very ombustible, and they are exposing me every few minutes, someimes when you least expect it; it is not necessary that all the parks should go there, but one spark would set me on fire; if there s not much wind this dust collects, it lays inside, a little dust lays here; that is the stuff that will burn like powder, and if this spark inds us it will destroy us before we know it, and even if our proprty is insured, it is going to cost us a great deal of moncy; in my andid opinion, as I have looked it over, it will cost about \$6,000 a ear to pay extra insurance.

Q. How much insurance are you carrying at present?

A. I cannot say exactly, but in the neighborhood of \$80,000. rould cost us \$6,000 more than it costs us now. We carry about alf. We consider we have got a nice risk now. It would cost us 6,000 a year more probably.

971 Q. How much insurance are you carrying? A. About \$80,000.

Q. About how much of the risk do you carry without insurance?

A. About as much more.

Q. You value the property at about \$150,000 to \$160,000?

A. Yes, sir.

Q. Including the stock?

A. Yes, sir, we calculate that we have got to carry, it would not be less than \$160,000, because there is \$20,000 or \$30,000 stock in the mill.

Q. Half of that you calculate to have insured?

A. Yes, sir.

Q. And the other half you take the risk yourself?

A. Yes, sir.

Q. In case this extra danger from fire comes there, you would feel like insuring all of it?

A. Yes, sir.

Q. Then you would insure \$160,000?

A. Yes, sir.

Q. What premium do you pay upon your present insurance, or

what rates?

A. We have been insuring in these mutual companies, and I think that costs us about three and a half per cent, but if we insure in those stock companies—I heard Mr. Jones' testimony the other day, that he charges us five and a quarter on the mill and four and a half on this dust-arrester part, and he says he will have to increase it two per cent. on the mill, and that he won't insure the other at all. But if we are paying now, we will say \$4, that would be \$32 for \$80,000, we have got to pay \$2,000 more on that,

two per cent. would — \$1,600 more; then we have got to insure at seven per cent.; he says he will raise it two per cent.; that will be seven per cent. on sixty, that will be

\$4,200 more; that will be \$6,800.

Q. You mean on \$80,000?

A. Yes, sir.

Q. That is seven per cent. on \$80,000. You calculated it on

sixty?

A. Yes, I want to insure \$80,000; that is a question that can be figured up. I have got to pay two per cent. additional on \$80,000, that is \$1,600 a year. Then I have got to pay seven per cent. on \$80,000; that makes between \$6,000 and \$7,000 more.

Mr. Baker: Have you got it finally fixed at \$7,200 additional

insurance?

No answer.

JUROR: Could you not build a new structure there; tear down the old and build a new, build out to the walk, and build a new four or five story wall, an extra structure?

Judge Chipman: He means to put up a new structure at your expense, to keep out the sparks from that company.

A. That would shut out all my light. They say that the fittest We are not the fittest, we will have to step aside, but it is survive. hard to do that; here I am 67 years old, and just commenced it seems, and now they come and trip me up, and destroy me. It is a shame.

Q. Do you understand that you are called on, in order to help a railroad company, to alter your property and go to an extra expense and change your plant, in order to help any company or any public improvement?

A. It seems I am.

Q. Do you understand that to be the law?

A. I understand that they are to pay this damage. I have offered to sell out to them. They have never made me any 973 approach, but Mr. Moran came to me and wanted I should make a proposition, which I did; I looked the thing over carefully, and I made an equitable proposition to sell to them for \$250,000, and I take my machinery and go away, and I would let them have the buildings; the buildings are in good, substantial shape; they could utilize it and make a machine shop of it on the fourth floor if they wanted it, and I could have gone away.

Q. Could you find such a convenient place?

A. I think I can find a convenient place.

JUROR:

Q. Don't you think there is any danger from sparks now?

A. In the way I am fixed, the Michigan Central did not injure me a bit; I have been there 20 years. The wind always takes it up We have never had the first intimation that there is and down. any danger. My exposure is from the west side; it is not possible to get anything there.

Q: What was the occasion of your fire in 1870?

A. My watchman burnt me up carelessly; the man shoved the shavings down there, and the whole mill was in flames in half a

Judge Chipman: Do the Michigan Central's locomotives come

by there near you?

A. They pass right by me. The engine never has occasion to come in. The engine comes and takes the cars.

Q. Let me ask you how far do the Michigan Central's locomotives

go from your plant there?

A. It is probably about 100 feet; they run right along, when they get up towards the other end they are nearer then, they are within probably 20 or 25 or 30 feet of my shed at the further end.

974 JUROR:

Q. The dust-arrester is facing east?

A. The west.

Q. The part that is facing east is entirely open, is it not?

A. We tore it down there at the further end.

Q. Now, trains passing over the Michigan Central, are you not troubled with sparks from the locomotives?

A. No, sir; I never saw a spark come over our shed in the world.

By Judge CHIPMAN:

Q. You have got that high, big mill between the dust-arrester and that?

A. Yes, sir. There are no sparks come over our shed, and the shed is close by the railroad; it is up pretty well, probably 25 feet high.

Q. The main body of your mill is there?

A. The main body of the mill is further down, over there to the south.

Q. Does not the main body of your mill come between the Central railroad and your dust-arrester?

A. Oh, yes.

Q. It comes between?

A. Yes, sir.

Q. Now, your dust-arrester is open at both sides, at the top, both

east and west?

A. Yes, sir; but it is 200 feet away from the Michigan Central railroad, and it is probably 30 feet high; it is 30 feet above the Michigan Central track, and it is 200 feet away; the dust-arrester is about 200 feet away.

Q. Beyond the danger from fire, what other detriment do you consider this elevated road to be to your property, as to light, as to cinders, as to impairing your machinery, air, and everything?

975 A. In the first place, we have quite a retail trade. come there to get lumber from us, and it is going to obstruct The day before yesterday we had quite a mishap there; one of our old customers came in there with his team, and it seems our foreman got on with him, and they were passing that place where they were driving spiles with their little engine, and the team took fright and ran, and it was represented to me that the man said he would never come in there with his team. I know that will be the

Q. They are driving spiles for this same elevated road?

A. Yes, sir. Q. Go on.

A. And a man is setting his machinery, planing knives and mouldings, and there comes along a train of cars; this light is going to flicker-every car that passes it will create a streak of light in there.

Q. It breaks the light, just as though you were sitting on the

track on a car and a train passes you?

result, people will not come in there.

A. Yes. The man who is setting these knives cannot do it until this train passes. By a fair estimate it is going to take two and a half minutes for a train to pass. That will occur a great many times in a day, and of course that is going to be done at my expense, and every time the smoke and cinders comes along here, it is going to darken my windows; you cannot keep it out; with a

wire screen up there, it would obstruct the light. We cannot do our business.

Q. If you get a wire screen there fine enough to arrest sparks and

keep out dust, what effect would it have on the light?

A. It would obstruct our light and our circulation of air. Our mill is so arranged that all the light we get in the lower story comes through the doors; the doors are 11 feet high and 976

9 feet wide, and they are left open and the light comes in it so, underneath, and if we built this structure up here, it is going to obstruct that light very materially-it is going to make it so dark that I don't believe it will be a practicable thing for us to run it without enough light.

Q. Some of the jurors have asked about putting wire screens in front of these windows. A wire screen fine enough to keep out dust, cinders and smoke-what effect will it have on the light?

A. I would not think of it myself. I would dry up. I would

not do business there that way.

Q. A juryman suggests you could enlarge your windows. Don't

you think the next step would be to pull down the mill?

A. When the old mill was built it stood on the edge of the street, and we used to drive through an opening and go the other way. We thought we should change it. We made a mistake in doing it; we ran it about 36 or 38 feet back from our light to the face of this wall. Now we drive in and back in, and the result is we get our light through these openings, through these openings the whole length of the mill; we cannot get it from any other source; if we had built that wall on the line here, as we contemplated-we thought we would do it a couple of years ago, but we discussed the matter, and we found it would make us so dark that we had better not do it-our machinery would have to be set in further, and we did not do it. Now, this structure comes in the same way, and it will make it so dark as to practically exclude us from the light. The question of surveying our lumber has been brought up.

all lumber, as we ship it, after it is dressed, it shows its imperfections, and you have to have a bright light to see it;

you send it to New York, and if it is not absolutely in line, they will kick right off; and in order to see the quality you have to get good light; it cannot be done in the mill; after it is in the machine every imperfection shows; we run it in the shed, and the light comes in there, and we discern whether it is second or third or fine common or uppers or whatever it is, and it is classed according to the quality, and it goes to market, and if we keep our standard up we are good fellows, and if not we are busted.

Q. If the quality is not right, if they kick, what do they do?

A. We have to let them have their own way. We have to make

a deduction of 5, 6 or 8 or 10 dollars a thousand. Q. They take as big an advantage as they possibly can? A. Yes, sir.

977

Q. This grit or cinders coming in, what effect will it have upon your fine shutters?

A. That has been explained; these cinders are gritty, and it will

take the sharp edge off your knives, and you will have to stop three or four times a day and file your knives, and a man would have to stop three or four times to file them up.

Q. How about your saws?

A. The saws are on the same plane; they dull easy, and they would have to be filed up.

Q. Do you keep one man filing saws all the time?

A. Yes, sir.

Q. What kind of light does he need for that?

A. The very best.

978 Q. What kind of light does he need for sharpening knives? A. He has got to have good light. We have to have the

best of light to set them; in filing a knife a man can do it without so much light, but he has to have an extra light to set them.

Q. In moulding knives?

A. You must not have any grit about them. Q. And how about the light to fix them?

A. You have to have good light to set your knives to make mouldings or to do any kind of work.

Q. The moulding knives have complicated shapes?

A. They have got to be worked very nice; only experts know how to do it.

Q. As it is, you keep one man doing nothing but filing your saws?

A. Yes, sir.

Q. Your small saws?

A. Yes, sir.

979

Q. What do you do with the resaws?

A. They are filed by the men that run them. He has got to file them three or four or five times a day; it depends, if he has this gritty lumber he has to file them every two hours.

Q. How is it about your knives?

A. The men that run the machines attend to them.

Q. Anything that would be gritty and take the edge off your knives, or the set off your saws, or dull either the saws or knives would make so much more work?

A. Yes, sir; that depreciation comes from the stuff being on the

lumber when it comes on the material.

Q. But anything of that kind has that effect? A. Anything of that kind is objectionable.

Q. And it would only make so much more work in the mill to keep the tools in order?

A. Yes, sir; that is so.

Q. And that you would have to pay for?

A. Yes, sir; and besides that it is going to discolor your good lumber-it is going to muss it, darken it, make it dingy, and in the work that it is used for it will bring it down in streaks, and that will never do.

Q. How about the hands of your workmen in taking hold of a clean board?

A. That would dirty it; it should be clean.

34300

A JUROR: Would it not be a good plan to make an estimate of the cost of removing all the machinery to the other side of the

building?

A. I could not do that. We have got it arranged now; we have got a nice, happy arrangement so that we can handle more lumber than Mr. Thompson can.

Judge CHIPMAN: Where do mean?

JUROR: On Fort street.

Q. Where is the front of your mill?

A. On Woodbridge street.

Q. You have expended about \$9,000, leaving that front out on purpose to get down to that level there, so as to do business?

A. Yes, sir.

Q. You have expended for your water there, bringing it on that level, some \$3,000 more?

A. Yes, sir.

Q. You have expended money on all your sewers, bringing them in there?

A. Yes, sir.

Q. You have all your pneumatic and steam apparatus

fitted to that level?

A. It is built just situated as we are, because we wanted the railroad facilities, and it is not every day we can get those facilities; it is in the heart of the city, and we deliver seven loads of boxes a day; Mr. Thompson delivers two with the same labor.

Q. Could you, for an expenditure of \$50,000, change that mill front around, so that you could operate it and make the front on

Fort street?

980

A. It would not be possible.

Q. Could you do it?

A. No, sir.

Q. Could it be done for \$50,000?

A. No. sir.

Q. Could it be done without building a new mill?

A. It tires me to think of it.

Q. We are all tired, the counsel and the jury are tired, but we want to know.

A. Mr. Baker has a way of doing it; he is going to bring cars

Q. I am coming to that in a minute; but could you do it for \$75,000?

A. I would not fool away my time in that way, because it would be simply preposterous and boy's play; I could go down on the Rouge and build a mill and do it for less money and get it so I could handle it, but we are all constructed here; let us alone; put your railroad across the street and let us have our place as we calculated to have it; we have been there 20 years, and we had no

thought of this thing coming up, and we built this thing as 981 we thought was right, and we have used it and made a success of it up to today, and we want now to be let alone, that

is all.

Q. Mr. Baker yesterday suggested, when Mr. Thompson was or the stand, that you might have tracks run inside alongside of you planers, to take the place of these trucks that he says he runs in

Mr. BAKER: The wagons that Mr. Backus uses.

Q. Now, they have got those trucks up into your second or third story; which would it be; it would run to the third story?

A. Yes, sir.

Q. Would it be practicable to run railroad tracks in among your planers, and run and take a flat car in with a load of lumber, and feed from the flat car to your machines?

A. No, sir. The trouble is this: When you bring your lumber

in there, you have a certain thing to go through-

Q. But I want you to confine youself to this. Now on the third story, or we will say it was down on the first story, down on the basement, or whatever you choose to call it; could you run along side of every planer; would it be practicable to put there a railroad track to carry in a flat car of lumber and feed your machine from it?

A. No, sir.

982

Q. Would it be practicable to feed your machines from the third story situated as they are now?

A. It is not possible.

Q. Would you not have to take them all upstairs?

A. I don't know. Mr. Baker can tell you about that. Q. Would you not have to take them all upstairs and alter the entire arrangement of your mill?

A. We can do better if we want to, by buying a new mill. Q. I ask you if it would be a possibility in this case?

A. No, sir.

Q. Would not these changes in these guards, in these protections, all of which have been suggested here, from various sources, the fire-walls, the making of bigger windows, the putting up screens, the changing of your arrangement for your dust-room, and taking a planer up in different parts of the building from what you are now, would not that amount in effect to building a new mill?

A. Worse than building a new mill. I could build two mills

sooner than change that one.

Q. Is there a lot of stuff you would lose there-piping and such things, if you made a new arrangement; piping and tubing and such things?

A. Yes, sir. There would be very little value, although that machinery cost us a great many thousand dollars. The machine that

cost us \$1,100, you could not get today \$400 for it.

Q. To move it?

A. Yes, sir. These saws that cost me \$750, you could not get \$300 for. I did find the customer for one for \$300.

Q. You bought these machines to use there? A. Yes, sir.

Q. These things are of full value as they stand there?

A. Yes, sir; I could not buy them for any less if I had to buy them again today.

Q. And you make just as much money with them now as when

you first put them in?

A. Yes, sir.

Q. And you have got them correctly set and running smoothly and nicely?

A. Our appliances are better today than eight years ago.

983 Our machinery is settled down to business; if there was anything proved frail we have replaced it with something that is substantial.

A JUROR: Do you mean to say that your machines are just as

good today as they were eight years ago?

A. Yes, practically.

Judge Chipman: Does not the mill work better today than eight years ago?

A. Yes, sir; everything is adjusted gradually to its purpose.

Q. It takes some time before you get all the parts adjusted and

working harmoniously?

A. Yes, sir. Many mills are built three or four times before you get them to work harmoniously and well. We have not got a mill there that is second hand.

Juryman Traub suggests that it would be well to have a commit-

tee of experts as to the value of the mill and machinery.

Mr. Baker: We will show the value of the mill before we get through. When we put in our evidence we did not go into the value of the mill; we just proved the value of the real estate. Mr. Backus is going on and trying to tell you what that mill is worth. In rebuttal we will show you what we think it is worth, and we will do it by expert men.

Q. What else have you to say in regard to the value of this prop-

erty and the damage that this road will do you there?

A. If I was to build the mill over again today in that place it could not be done for a dollar less than we have done it for. We did everything as economically as possible. You could not buy

your brick or get your labor as cheap as we did. We have 984 made no charge for our services. I worked there all through this, and my boys. We make no charge for that; we throw that in. It cannot be done any cheaper and it cannot be done any

better.

Q. It is the result of long experience?

A. Yes, sir. Here is a mill that is constructed to carry 100 tons weight anywhere; it does not settle. My shafting is in line; it runs easy. My belts are double, two thicknesses, endless iron twiners; everything in first-class order. The shafting is straight and true.

Q. Did it take any time to get all this?

A. It has taken me my whole life; it has been my life-work. You cannot do this thing in a short time; you have got to work it over and over and over and over.

Mr. BAKER: You have done that since 1882?

A. Yes, sir, but I have used my experience. Judge CHIPMAN: You mean the experience that you gained before 1882?

Q. You built a better mill in 1882 than your first mill?

A. We aimed to.

Q. You know you did, don't you?

A. We have learned a great many things that we didn't know when we commenced.

Q. Have you observed the running of locomotives? A. Yes, sir.

Q. Do you know anything about the efforts that have been mad to get smoke-consumers?

A. Oh, ves.

985

Q. Don't you know-I suppose the jury know it, but I have go to prove it-don't you know that for years patent after patent ha been taken out, and effort after effort made to get something the would stop the cinders-fire and cinders, from escaping from engine

locomotives or others?

A. There have been a great many appliances adopted.

Q. Have you ever seen one-I am not speaking of yourshave you ever seen one outside of yours which effected the pur pose?

A. No-practically. That one that we were on the other night did it when it was in the hands of an expert fairly well, but that i

not a success, it is far from it.

Q. You observed the sparks and cinders coming out from tha now and then?

A. Yes, sir; but it did it pretty well compared with others, but i

is not a practical thing.

Q. You said it did it pretty well, and yet you said it was not practical test. Will you tell the jury why? You have given a

good deal of attention to this subject.

A. I will tell ye I how they come to do it the other night, to al appearances, but I an tell you why it won't be a success. In the first place, they used what they call the Orvis & Hutchinson patent blowing the steam in among these cinders; they managed so tha in this smoke-pipe below there was no supply; to illustrate, suppose they start from Chicago and come here; when they come here they have got this all full of cinders, and as they come in it will blow these sparks out more than it will do now, because they did no have them in the other night when they started; it was all empty and they were using as much steam to generate as they had; that is the scheme that has been used many years, the Orvis & Hutchin son smoke-consumers, blowing the steam into the fire, and of course a great deal of that steam will put out a great many of these sparks but they do not get onto the true principle; it is air they want to make a fire-oxygen; it is just as essential to have oxygen as to

have coal, and the secret is how to blow it in, how to get 986 the air in there, to have the air get to the screen sheet before it burns; I have seen this thing occur: when the man opened

the door to throw the coal in, if he left it open a minute or two minutes, they would have to put that engine in the shop and caulk all those flues. This thing you had the other night will spoil your flues in the same way; it is not a practical thing. But what has that got to do with this subject?

Q. That is what I asked this jury.

A. It is wasting time; it has nothing to do with this subject. When they come down there with a locomotive it is going to burn us up, dead sure.

Q. (Showing lamp.) We had an illustration here with this lamp the other day. Where is the draft, where does the oxygen get into

this when it is on fire here?

A. What is this?

Q. It is a gas lamp. It is the principle of all lamps.

A. The air comes right in here and goes round, and if you close

this up it will smoke.

Q. In other words, it is like making a fire generally; when you make a fire and blow from underneath you are apt to blow the oxygen in and make the fire blow out?

A. It is the air that makes the fire.

Q. And if you blow on top it is pretty hard to get a fire burning. Did you ever try to kindle a fire by blowing on top of it?

A. It is hard.

Q. On these locomotives, as I understand it, they check the fire by cutting off the draft from underneath with the dampers?

A. They close the dampers below and open the door, and that

will check it right down.

Q. They check the fire by opening the damper, which is 987 underneath?

A. By closing the dampers.

Q. Now in a coal stove, and in most stoves, the damper is generally put above the fire, in coal stoves, at any rate-

A. They have them both sides of the fire, one back of the fire and

one in front.

Q. I mean the regular damper.

A. You should get Mr. Moran to tell that.

Q. But they have them so that the air comes in right on top of the fire, and opening the door lets the air on top of the fire instead of underneath it?

A. Yes, sir, that will cool your crown sheet and make your flues

leak and spoil your business.

Q. You say that this engine they had the other night, under the process it was working, if it made a run of any distance, there would be such a tremendous accumulation of einders forward that it would not work?

A. It would throw the fire.

Q. Did you ever see that engine working at any other time than that night?

A. I think not.

Q. Engine No. 35?

A. I saw it a night before; I saw it Wednesday night and Satur-

day night, and they were not looking for me then, and she threw fire then a great deal more that night than when we went down to the Rouge, and when they blew that steam in you could hear a noise just as though she was blowing off; she was using as much steam as she would generate when she stood still.

Q. When you and I looked at her before she started that night,

what was going on in that engine before she started? 988 A. I went up and looked at the steam-gauge and saw she was losing, she was not making steam; instead of having 135 pounds, she had got down to 120 or 125, and you could hear her roar, but it was going into the fire and going out of the smokestack, and what sparks would get in there would be naturally squelched with that steam. But what has that to do with our subject? I am tired and I wish you would let up on the jury.

Q. In other words, this steam that she was using was going to quench or put down the fire and to absorb those cinders, as it were?

A. It is not a practical thing, in my opinion: I don't believe it is a practical thing to do. It is a thing that was applied 18 or 20 years ago; those patents that covered that thing have become obsolete; it has not been in working order; I have seen a great many of them.

Q. What was done with those that were tried?

A. They passed off. He had this thing patented 17 years ago, I believe.

A JUROR: The last one is not patented yet. Judge Chipman: But the general principle is,

A. That is the same principle; it is the Orvis principle. Mr. Baker: Mr. Barnes says it is something new.

A. They blow it in; they put a jet of steam here, and it puts them out here.

Judge Chipman: You have studied this subject and taken out patents on this same thing, have you not?

A. Don't tire me.

Q. You have studied the subject and taken out a patent?

A. Of course; I have taken out a good many patents that were not worth a cent.

Q. But on this smoke-arresting business, you have made a business study of it? 989

A. Yes, sir.

Q. Is there anything new in this Barnes idea, that he advances here, except that he does not use a screen; he uses a plate with holes in it?

A. He uses the same appliances, I guess; only he applies this steam, as I understand, at the front end; just as it goes out of the smokestack he lets a jet of steam go in here that puts it out. He has got an expert there to manipulate it; it is important to have an expert, a man that knows how. He will find it very difficult to make the thing go after he gets through with this trial; this thing will die out; it will not be heard from again, probably.

On Friday, owing to the non-attendance of a juror, the matter was further adjourned to Monday, July 6, 2 p. m.

Monday, July €, 1891-2 p. m.

ABSALOM BACKUS, JR., continued.

Cross-examination by Mr. BAKER:

Q. You say you bought the land where your planing mill stands or the most of it, in 1871. Do you remember of whom you purchased it?

A. William Darmstaetter was one, and George Prentiss, the lum-

berman, I think he was the man.

Q. Did the property that you purchased of Darmstaetter run through on both streets?

A. Yes, sir.

990 Q. How many feet did you purchase of Darmstaetter?

A. I could not tell you.

Q. Do you remember how much a foot you gave him for it?

A. It cost me \$16,000, the first purchase. I had to pay \$1,000

A. It cost me \$16,000, the first purchase. I had to pay \$1,000 to get a man off.

Q. The price to Mr. Darmstaetter was \$15,000?

A. I think that was the price.

Q. What was it used for at that time? A. Boiler shop and for drying hair.

Q. This was a yard that was connected with it?

A. The boiler shop was on Woodbridge street, and the drying hair on Fort street.

Q. Did they have a building there?

A. A cheap, temporary building. Q. The tenant you gave \$1,000 to?

A. Yes, sir.

Q. So that the Darmstaetter property cost you \$16,000?

A. Yes, sir.

Q. You don't remember the frontage of that property?

A. No, sir.

Q. You purchased that in 1871?

A. Yes, sir.

Q. What other purchase did you make?
A. I bought from Appleyard and Coyeau.

Q. Where was the Darmstaetter property situated, on the mill property, the extreme westerly side?

A. The mill proper stands on the Darmstaetter property.

Q. Did you buy between the mill and Steadly?

A. Yes, sir, that was the Coveau lot.

Q. How many feet did you buy of Coveau?
A. If I remember right, 33 or 34 feet.
991
Q. What did you give him for it?

A. I can't remember.

Q. Does his lot run through to Fort street?

A. No, sir.

Q. You don't remember the consideration?

A. No, sir, I do not.

Q. What other lot did you buy there?
A. The Prentiss lot.

Q. Where was that situated? A. Right in where the mill stands.

Q. Between the mill and the Mary Specht property?

A. No, that was Appleyard's.

Q. Where is it situated?
A. The Mrs. Coveau lot was where the dust-house stands, and then the Prentiss lot came in. I think it was 60 feet, or something like that.

Q. Where was it situated on that property?

A. Next to the dust-house, where the mill stands.

Q. How many feet?

A. I think it was 60 feet, or something like that.

Q. How much did you give them for it?

A. I can't tell you.

Q. Where is the Appleyard property situated? A. Right where our sheds are, the railroad tracks.

Q. How many feet did you purchase?

A. 40 or 44.

Q. What did you pay for it? A. I think that is \$4,000.

Q. What year was that purchase made?

A. I can't say; perhaps five or six or eight years after we bought the first.

Q. Does the 44 feet run back to Fort street?

A. No, it came up to the Michigan Central railroad.

Q. Where is the Prentiss property? A. Next to the Coveau property.

Q. The only property that you bought that went through to Fort street was the Darmstaetter?

A. Yes, sir.

992

Q. And that did not go all the way through?

A. Yes, sir.

Q. Is there not a jog there?

A. The property on the back side of the mill measures something like 300 feet.

Q. Is there not a jog there, so that the lots on Fort street extend further west than the lots on Woodbridge?

A. Yes, sir; the width of Mrs. Steadley's.

Q. Of whom did you buy that property directly north of Mrs. Steadley?

A. Darmstaetter.

Q. His property did not run through to River street?

A. His property lays around the Prentiss lot. Q. Only a portion went through, then?

A. A portion of it lay on the Michigan Central road, this jog of the Prentiss lot and Mrs. Steadley's lot.

Q. Was your first mill erected upon all this property?

A. My first mill covered the property that is now covered by the mill and the dust-house, and the open space in front out to the street.

Q. Did it cover the place where the office is?

A. The mill did not cover it then.

Q. Did you own it then?

A. Yes, sir.

Q. When did your mill burn up?

A. In October, 1882.

993 Q. How long had it been built at that time?

A. About ten years.

Q. Did that mill property have a frontage on the Michigan Central property, upon the northeast corner?

A. Yes, sir.

Q. And it always has had that frontage on the Michigan Central, has it not?

A. Yes, sir.

Q. And you owned all this property that you occupy now when your mill burned in 1882?

A. Yes, sir.

Q. Immediately after that fire, you proceeded to rebuild, didn't you?

A. Yes, sir.

Q. Did you try to buy the Steadley property so as to go through the same width to River street?

A. I tried to buy it.

Q. What did you offer Mrs. Steadley for it?

A. She was offered \$8,000.

Q. What did she ask you for it?

A. I think it was \$9,000 and not five cents less.

Q. You refused to pay it, didn't you?

A. Yes, sir.

Q. It was not worth it?

A. I felt as though it was not worth it at the time.
Q. It was not worth the \$8,000 you offered for it?

A. It would have been to us.

Q. To any outside purchaser, it was not worth that amount of money, was it?

A. We wanted it.

Q. You wanted it and you offered more than it was really worth to get it?

994 A. We did not consider it was more than it was worth; we wanted it so bad that we were willing to pay \$8,800.

Q. Do you think it could have been sold to anybody for as much money as you offered for it?

A. I don't think she could have got that for it.

Q. What I want to prove is that you made a good, fair liberal offer for it, but that you did not get it because she wanted \$9,000 for it. How many feet did she have?

A. I think it is 64 feet.

Q. Running halfway back?

A. Yes, sir.

Q. Your dust-room is a long, red strip on this map on the westerly side of your property?

- A. Yes, sir.
 Q. That is built on the line of the Steadley property, is it not? A. Yes, sir.
- Q. The Steadley property is 65 feet wide and it represents the property that lies south of the yard where your dry-kilns are on this map. Your office is on Fort street. You go into your property on the west of your office?

A. Yes, sir.

Q. But you only go back halfway, to the southeast corner of the large square marked yellow?

A. It is more than halfway, about 165 feet.

Q. The Steadley property is the River Street property that lies right in front of that, is it not?

A. Yes, sir. Q. With a frontage of 65 feet?

A. Yes, sir. Q. Mrs. Steadley lives there?

A. Yes, sir.

Q. For 65 feet of that property you offered \$8,000, and she 995 refused to sell it to you, and wanted \$9,000?

A. Yes, sir.

Q. Was that after your fire in the fall of 1882?

A. Yes, sir. You want to understand that there was a hill, an

excavation about nine feet deep.

Q. We will come to that. Your property, from the southwest corner of the dust-room to the west side of the second track from the mill, that was the extent?

A. Yes, sir; 238 feet and a fraction. Q. How far is it back to this jog? A. I understand it to be 150 feet.

Q. How wide is this jog?

A. Sixty-four feet.

Q. And then it goes through to Fort street; how much frontage had you on Fort street?

A. Sixty-eight feet.

Q. The Michigan Central owns a right of way that bounds you diagonally-right across like that?

A. Yes, sir.

Q. And Mrs. Mary Specht owns a small brick building and a lot just east of you, that also runs back to a diagonal line on the Michigan Central?

A. Yes, sir.

Q. And the Michigan Central owns east of her?

Q. Did the Michigan Central own this right of way when you located there in 1871?

O. Did the Michigan Central own this strip, 14 feet, running to River street?

A. No, sir; I bought it.

Q. You bought that after that; what did it cost you? 996

A. I don't remember what I paid for it.

Q. Seventeen feet of it?

A. Yes, sir; I think it was \$2,000.

Q. How long ago was that?

A. I could not tell you.

Q. Was it before or after your mill burned?

A. I think it was after. What makes me think it was after-Mr. Specht, when they took the photograph of the rooms, he stands there, and I think he lived there.

Q. You bought that and conveyed it to the Michigan Central.

and they put in a side track for you?

A. Yes, sir.

Q. And they gave you just what the land cost?

A. Yes, sir.

Q. Who built the side track?

A. I think the Michigan Central did. Q. Did you have to pay any of it?

A. There was a consideration. Q. What was the consideration?

A. They wished me to convey them the right to lav a large water pipe through my premises, and said if I would do it they would lay me the side track.

Q. Did they do it?

A. Yes, sir.

Q. Where is this water pipe? A. Right under that track.

Q. Running to the river?

A. Yes, sir.

Q. Right under this same property that you deeded to them?

A. No, sir; it was under the side track.

997 Q. You bought this property and deeded it to them for \$2,000, just what it cost you, and they put in the side track and built it entirely at their expense, in consideration that you would let them lay a water pipe under the track by which they connected with the river?

A. Yes. sir.

Q. You don't seem to remember what you paid for this property?

A. I know very nearly. I know we paid Appleyard \$4,000, we paid Mr. Prentiss \$6,000 or over, we paid Mr. Darmstaetter \$15,000, and I paid \$1,000 for getting a man off, that made it \$16,000, and Mrs. Coveau, I forget whether it was \$3,500 or \$4,000.

Q. Altogether the property didn't cost \$30,000-the purchase

price?

A. More than that.

A JUROR: That would be less than \$30,000, as you have stated it-\$29,500.

A. We calculated it cost us about \$9,000 to excavate.

Q. I am not talking about that, I am talking about what you paid for the real estate?

A. You have pretty nearly got it.

Q. And you purchased that property in 1870 and since then?

A. Yes, sir.

Q. How late was the last purchase?

A. Appleyard's was the last.

Q. When did you do this excavating?

A. The great share of it was done in the winter of 1871 and 1872. Q. Was not the natural lay of the land on River street very near

to the level of the river? A. It was right at the sidewalk, but it immediately raised 998

very fast.

Q. Has not the grade of Fort street, in the construction of the Fort Street bridge, been considerably raised at each time the bridge has been reconstructed?

A. Yes, sir.

Q. How many feet has that street been raised in front of your property there?

A. The last time it was raised about four feet. Q. The first time, how much was it raised?

A. I can't tell you.

Q. It was raised a couple of feet or more?

A. You know better than I do.

Q. Don't you know that when you went there in 1871 that the bridge had been built, that the approach had been built to that bridge, and that the street was higher than the adjoining property? The approach was to a wooden bridge when you went there?

A. Yes, sir; we had to fill it up several feet.

Q. You had to fill it up in front where your office stands and where your yard stands. You have not filled it up since they raised it this last time?

A. No, sir.

Q. They have put it now some two or three feet above your yard, haven't they?

A. They have this last time.

Q. It is two feet or more above your yard, is it not? You have to go down hill to get into your yard?

A. It is nearly four feet.

Q. The city did that when they put in the new bridge, or the Michigan Central, between them they did it?

Q. Considering the natural lay of the land, will you tell 999 us how many feet you had to excavate to get down to the level of River street?

A. I think we had to excavate about nine feet back for 150 feet. Q. How much is Fort street now above River street in front of

your property?

A. I think it must be 16 feet. Q. You excavated from River street back so as to get a basement

story there and to have a yard in front on Fort street, at your second floor?

A. We had to fill that up. We filled it up three or four feet. Q. The land lay to advantage to do that?

A. We put some dirt there.

Q. River street was considerable lower than Fort street?

A. Yes, sir.

Q. So that the land was the shallowest on the River Street side, and you simply excavated it there just about as you would for any vard, didn't you?

A. We drew that dirt down and filled our dock.

Q. Down there you had some property where you wanted to fill it up, didn't you?

A. Yes, sir.

Q. When you talk about \$9,000, you talk about the expense of hauling the dirt from this mill property down there?

A. Yes, sir.

Q. You got the full value of the \$9,000?

- A. We took it there because we had no other place and we wanted it.
- 1000 Q. For every cubic foot of land that you took away you got a cubic foot more below?

A. Yes, sir.

Q. And you docked out so that you have some seven acres and a half of land?

A. Yes, sir.

Q. And, at least, half of it is made land?

A. No, sir.

Q. A third of it?

A. You are telling it, I don't know.

Q. A quarter of it?

A. We filled in probably 400 feet in the water.

Q. And when you talk about \$9,000, it was the entire expense and putting it below?

A. That did not cover it all.

Q. We are talking about the excavating. A. I would not want to lead you astray.

Q. See that you do not get astray yourself, never mind me.

A. The Appleyard lot was a hill, and we had to move that afterwards later on.

Q. Where did you take that to?

A. We drew a good deal of it down there.

Q. So you drew it all down there, didn't you?

A. Most of it.

- A JUROR: You improved the lot by the excavation at the same time?
- A. That is the way I always do, make one hand wash the other if I can.
- Q. You have only a trifle over 300 feet on both streets, 238 and 38?
 - A. That is right.

1001 Q. Did you realize that you swore that that property was worth something like \$500 a foot?

A. I realize that I have always counted it as worth \$150,000.

Q. Did you realize in giving that testimony that you were testifying that that property was worth, the land itself, \$500 a foot?

The property just across the road, without any im-A. Yes, sir.

provements, was sold for \$500 a foot.

Q. Do you adhere to your testimony that in your judgment that property, the naked land, is worth \$500 a foot?

A. I say this much, that land has never been for sale.

Q. Answer my question.

A. I will answer it in my own way. That land has never been offered for sale, and I have counted it worth \$150,000 for this reason, it was leased to our company for \$5,000 a year, and I was offered \$150,000 for that land and take off all the buildings, and that figures up to more than \$500 a foot.

Q. Who offered you \$150,000 for the naked land and take off the

buildings?

A. Luther Beecher; do you know him?

Q. Is that the only reason you have for stating that it is worth \$500 a foot?

A. No, sir; we have held it for that for years past.

Q. You say you think it is worth that because you rented it for \$5,000 a year?

A. That is one of my reasons.

Q. Was that not a bargain made between you as owner, with your two sons and yourself as the members of the corporation?

A. Of course it was. Q. It is in the family? A. Of course it is.

Q. It was a bargain that extended over a great many years? A. Yes, sir.

1002

Q. Beecher owns the property just this side?

A. Yes, sir.

Q. Are you sure he owns it?

A. I have always been told he owns it.

Q. Don't you know that the Detroit Railroad Tunnel own that property?

A. I don't know.

Q. Do you know what your property is assessed at-the real estate?

A. I do not.

Q. You say one of the reasons you gave for testifying it is worth \$500 a foot is that the property right across the road sold for \$500?

A. I gave that as a comparison. Q. Was not the property across the road sold for \$400 a foot?

A. I read, and it has been told me, and I have got it I don't know where, that 160 feet sold for \$80,000. Figure it out yourself, and a sewer under it at that.

Q. How many feet?

A. 160 feet.

Q. And it extends from River street to the channel bank of the Detroit river?

A. Yes, sir.
Q. You could not buy it for \$2,000 a foot?

A. Yes, sir.

Q. Was not that a strip that belonged to the D., L. & N. 1003 that ran right through the Michigan Central yard?

A. I suppose so.

Q. On this river frontage?

A. Yes, sir.

Q. Do you mean to testify that river property, upon the south side of River street, extending to the channel bank, the value of the privileges to the riparian owner is not worth more than property upon the north side of the street, situated as your mill property is?

A. It is not necessary that I should testify that way. I can grant that it is worth more. You could not buy it for \$2,000 a foot.

Q. The river front is worth a good deal more?

A. It would be, of course.

Q. It is worth twice or three times as much?

A. It depends upon what you want of it.

Q. Suppose it is advantageously situated along the Detroit river, is it not worth, as a general proposition, at least three times what the property on the north side of the street, running back the depth the ordinary lot, is worth?

A. It depends upon the location of the other lot. Q. Generally speaking, up and down this river?

A. We are talking about these premises of mine. I bought these in 1871, to get cheaper facilities, so that I could load my cars. You

cannot load cars from any other source.

Q. I am not talking about your purchase in 1871, I am trying to find out the present value of this real estate. Do you still desire, as the owner of this property, to testify that you base your opinion of \$500 a foot upon the fact that river property upon the other side

of the street has recently sold for that figure?

1004 A. No, sir, I do not. I base it upon the fact that my property is valuable, for the reason that it controls a certain method of shipping, a certain point where I can ship to any part of the country.

Q. You located there, did you not, because you could get ship-

ping facilities with the Michigan Central?

A. Yes, sir, or any other road.

Q. And you bought a strip of 17 feet and paid \$2,000 for it, and you gave that to the company for the same price, and in addition to that you gave them the right of way for a sewer through other property of yours in order to get another side track, did you not?

A. We had the side track before.

Q. You did that in order to get another one?

A. They laid the other track on the 17 feet and gave us a lease of it, built the track and gave us the lease of it.

Q. Charged you rent for it?

A. \$1 a year.

Q. But finally you bought the property for them and gave them this right of way, and they own the property and maintain a side track and you use it?

A. Yes, sir.

Q. Does this model substantially represent those side tracks?

Q. Do not the Michigan Central main tracks run along by here on an angle?

A. Yes, sir.

Q. With your tracks connected with them?

A. A little this way.

Q. How long has your property been situated as it now is? A. Ever since it was built.

1005 Q. And these sheds were built there in 1883?

A. Yes, sir. Q. And they have been there ever since, have they not?

A. Yes, sir.

Q. Do you pile lumber under there as represented here?

A. We use them to load our lumber into cars.

Q. Do you pile your finished products under there like that?

A. We use them to pile our lumber before we get a car-load. Q. Under those sheds are there not at all times several thousand feet?

A. Yes, sir.

Q. And you have been using that in that way since 1883?

A. Yes, sir.

Q. With the Michigan Central trains passing by here?

A. Yes, sir.

Q. With it all open like that, so that the sparks and cinders can go right in upon the cars as they are standing on the side track? A. I never saw any sparks go in there,

Q. Did you ever see any cinders go in there?

A. No, sir.

Q. So that the Michigan Central yard has been maintained there without injury to your premises?

A. We never have been injured. You understand the Michigan

Central runs on an angle.

Q. It is all open between the engines and the trains and this lumber that is piled under there?

A. That main track is probably a hundred feet from there, 80 to

100 feet from that corner. 1006

Q. It is not far, is it? A. It is probably 80 feet.

Q. Is there any building or fence in the way?

A. No, sir.

Q. How far do you testify it is?

A. I should judge it is about 80 feet.

Q. Have you measured it?

A. No.

Q. Have you ever had occasion to build a fence or put up a wall or do anything to protect the lumber under these sheds?

A. No. sir.

Q. How many tracks has the Michigan Central right adjacent? A. I think there are six tracks.

Q. And they are in constant use?

A. These tracks next to us are the freight tracks—the way tracks.
Q. Their engines are working back and forth on these tracks

constantly?

A. They do not many of them come out this way.

Q. The engines that have constantly set fire to the wooden bridge that was there passed right along in front as they went under the bridge, and in a dry time would frequently set it on fire?

A. Yes. sir.

Q. How near is the nearest track of the Michigan Central to the line of the posts?

A. I should presume one track may be within thirty feet.

Q. And then following right along are six tracks, are there not?

1007 A. The main thoroughfare; the width of the road is some 100 feet, and the center of that would be 50 feet.

Q. Right after you come to this first track there are six others put in about as thick as they can be?

A. I think it is 150 feet wide.

O. I am sure I don't know how wide; there are six tracks put in there close together?

A. The track that does the business, where the trains pass out on

that corner, is probably 80 feet.

Q. Are there not four main tracks, two passenger tracks and two freight tracks?

A. I think there are.

Q. And there are twe others that could be called main tracks?

A. Six tracks in all.

Q. How often does a locomotive go up and down there?

A. Pretty often.

Q. Are not a number of switches situated right there, so that they diverge from a point that is south of the railroad bridge, of the Fort Street bridge, so that when they go into River street they have 13 or 14 tracks instead of six?

A. I think the switches are put this way, two of them.

Q. Some of them are up towards the bridge and between the bridge and River street; do not the tracks change from six to 13 or 14?

A. Not till they get way past our place.

Q. Are there not a number of switches that are right in front, diagonally across there in front of your property, at which switching is being done day and night, the entire 24 hours?

A. I think there are two switches.

Q. And they have been working there like that ever since 1008 1882 ?

A. I should judge so.

Q. Do you have any lumber brought in on these side tracks?

A. Very seldom.

- Q. Do you occasionally?
 A. There has been such a thing done, but it does not work very well.
 - Q. Do you make a business of it?

Q. You use these two tracks for your output and for shipping away the finished products of your mill?

A. That is what they are used for.

Q. Your mill is four stories high on River street?

A. Yes, sir.

Q. And three stories on the Fort Street side?

A. That is the condition of it.

Q. On the first floor in the mill proper you have some planing machines and resawing machines?

A. There are four resaws there.

Q. Have you a planing machine there? A. There are eight planers there.

Q. And four resawers?

A. Yes, sir. Q. By a resawer, as I understand it, you mean a circular saw with which you split lumber in two?

A. Yes, sir. Q. Take an inch beard and make a half-inch board of it?

A. Make two boards of it.

Q. What other machinery is there on that floor?

- A. There are fans and drilling machines, emery wheels 1009 for grinding and making our knives and several moulding machines.
 - Q. A machine by which you make mouldings for buildings?

A. Yes, sir.

Q. That is a basement, is it not, as far as the River Street front of it is concerned?

A. It is a ground floor.

Q. Are there any windows along the Fort Street side of it?

A. No, sir, not any.

Q. Are there not windows upon the east side of it under this shed?

A. I think there are two small windows.

Q. Are there any windows upon the River Street side of it?

A. There are six windows in the large doors, but the doors are standing open, consequently it is an open space.

Q. So that all the light you have in there is furnised substantially

by those open doors?

A. It comes through those open doors.

Q. Are there any windows upon the west side?

A. I think there is one. It would not give us much light.

Q. This dust-room is beyond and on the other side of a small alley?
A. Yes, sir.

Q. Is it not true that your planing mill already stands in a dark place?

A. Of course it is, most decidedly.

Q. Can your men operate your machines there successfully?

1010 A. Yes, sir.

Q. And they have done it for years?

A. Yes, sir.

Q. Have you ever put in an electric light plant to accommodate those machines?

A. No. sir.

Q. Or in any part of your mill?

A. No, sir.

Q. Is there light enough at the present time to operate the machines successfully?

A. Most of them. The light comes through these doors.

Q. With no windows upon the other side?

A. No. sir.

Q. Is all the lumber that you consume in that mill taken in at those six doors?

A. Not all of it.

Q. Where else about your mill do you take in any other lumber?

A. On the second floor on the Fort Street side.

Q. Have you an entrance at which you can deliver lumber upon the Fort Street side of the mill?

A. We take in lumber there.

Q. Is there not a yard on the Fort Street side of your mill that is on a level with the second floor?

A. Yes, sir.

Q. So that a team can go into your open court or yard there and unload a load of lumber upon the second floor of your mill?

A. Yes, sir.

Q. And you frequently do unload lumber there, do you not? A. Certainly.

1011 Q. About how many thousand a day?

A. I can't tell you that.

Q. Do you deliver at that entrance one-tenth of your lumber?

A. I should think we did.

Q. Do you deliver one-fifth?

A. I don't think we do.

Q. On the Fort Street side in this yard you have a place, have you not, for loading stuff to have it carried away for the local trade?

A. The business that goes through there is principally this box

department.

Q. Have you not in your third story, on the Fort Street side the second story, a slide by which you slide your products down into wagons?

A. Yes, sir.
Q. And you deliver a large amount of material there, do you not?

A. Yes, sir.

Q. Do you take that around the city or pile it up under the sheds in that court?

A. It goes around the city.

Q. Is your local trade supplied from that entrance?

A. The box department is.

Q. What proportion of your business consists in making boxes and box shooks?

A. I ought to have had that figured out.

Q. You know? A. I can't tell you.

Q. Is it a quarter of your business? A. That goes the other side.

Q. I want to see how much or what part of your business is making these boxes and box shooks?

A. Divide it.

Q. Can't you tell in a lump without dividing it?

A. If you go into the business you want to understand it, the boxes go up-

Q. No one has said anything about going into the business. What part of your business consists of boxes and box shooks?

A. Perhaps one-tenth consists of boxes: Q. What part of it consists of box shooks? A. It is pretty difficult to jump at it.

Q. I don't want you to jump at it, I want you to give us your opinion about it?

A. I should think half of our entire business goes into box shooks. Q. By a box shook I understand you to mean the boards cut into the right size to be nailed together for a box?

A. Yes, sir.

Q. Put up in bunches so that anybody can nail them together and have a box?

A. Yes, sir.

Q. You say you introduced that business of putting them up in that shape and shipping them over the United States and Canada? A. Way back in 1870.

Q. The boxes that you put up are delivered here in the city?

A. The boxes that are nailed up are delivered on the Fort Street side and go into the city. The box shooks go down the elevators and go into the cars.

Q. When you want to send boxes away you put them up in

shooks to save the freight in bulk?

1013 A. We put them up in that way so as to handle them conveniently.

Q. What do you use the lumber for that is delivered at the Fort Street entrance?

A. For boxes, box ends principally. We do not resaw on that floor, it is all cut up, worked there and cut into ends principally.

Q. Where is the lumber that is delivered at that entrance from, the yard at the foot of Eighteenth-and-a-half street?

A. Usually.

Q. You take there lumber that you do not resaw?

A. Yes, sir.

Q. Have you a number of planing machines upon that floor?

A. There are two large machines there.

Q. Two of the largest machines you have?

A. Not the largest, but large machines.

Q. They are close to this entrance?

A. Yes, sir.

Q. Are they fed from the north end?

A. Yes, sir.

Q. What else have you on that floor?

A. We have two traveling belts that go up through that floor and the elevators.

Q. What other machinery?

A. A jig-saw, boring machines, mitre saw, hand matchers, matching machines.

Q. Is there any other large machine there?

A. No, sir.

Q. So that the only place- that you now have for delivering lumber to the machines are upon the River Street entrance and this Fort Street entrance?

1014 A. Yes, sir.

Q. When you bring lumber into the River Street entrance, do you dress it upon the first floor if you do not resaw it?

A. We dress all the lumber that comes on the first floor, on the

first floor.

Q. And all the lumber that comes on the second floor, you dress it there, if it has to be dressed?

A. Yes, sir.

Q. Have you any resawing machines upon the second floor?

A. No, sir.

Q. If the lumber is to be resawed it is taken to the River Street entrance?

A. Yes, sir.

Q. If it is resawed, it is dressed upon the same floor?

A. Yes, sir.

Q. Put through a planing machine?

A. Yes, sir.

Q. Do you dress all your lumber down there?

A. Dress all the lumber that is delivered on the lower floor; it is all dressed there.

Q. Every foot of lumber that comes in is dressed?

A. Yes, sir.

Q. You do not send out any product in the rough?
A. No, sir.

Q. So that if it has to be resawed it is delivered at the River Street front and put through the resaws and then put through a planing machine?

A. Yes, sir.

Q. And dressed on both sides?

A. Sometimes one side and sometimes both sides.

Q. Do you pass that through machines that are used for the purpose of cutting that lumber up into shooks?

1015 A. No, sir.

Q. Upon what floor are your cutting machines?

A. On the second floor and fourth floor, and also on the outside 75 - -55

on the east end of the mill, and also at the south of the mill next to the street.

Q. In the court next to the fence where the six big windows are?

A. Yes, sir. Q. When you take lumber up on the first floor upon River Street and resaw it and put it through the planing machines and redress it, how do you take it to the fourth floor?

A. On a traveling belt, generally. Sometimes it goes onto a truck

and goes on the elevator that comes up.

Q. That is a series of belts and pulleys, by which you carry a

board right to the fourth floor?

A. It consists of an endless belt, rolling on rollers, and the lumber goes in and is held down by the rollers until it lands on a platform in the upper floor.

Q. When you get it on the fourth floor you cut it into shooks of

the right size?

A. We separate it into widths and thicknesses.
Q. The ultimate end is to make it into shooks?

A. Yes, sir.

Q. What do you do on the fourth floor?

A. That is used for storage largely. Still there are three or four supply sheds.

Q. You send your lumber up and sort it and pile it so as to have

a quanity of the different kinds on hand?

A. Yes, sir. It has to be stored in widths and thicknesses, and it lies on the trucks, and is not taken off the trucks. They load one truck with four or five thousand feet and shove it off and let

it stand, and another truck is sent, and by and by they 1016 whisper up that they want lumber so and so, and there is a truck already that is put on the elevator.

Q. You store it and have it upon trucks?

A. Yes, sir.

Q. What sort of work do you do on that floor?

A. There is a good deal of our local business done on that floor.

Q. Have you some cutting machines there?

A. Yes, sir.

Q. How many?

A. I think there are three.

Q. What other machines have you, any moulding machines up there?

A. No, sir.

Q. What have you besides the three cutting machines?

A. There is a saw where we cut wood, kindling wood.

Q. In bringing this lumber in and assorting it you have pieces left that you make kindling wood out of?

A. Yes, sir.

Q. Is that sawed up there?

A. It is sawed on the fourth floor.

- Q. If it is shaky you will have pieces thrown out when you assort it?
 - A. The waste.

Q. Where does that wood go to when it is sawed?

A. Goes out into the room over one of the dry kilns, and there we sell it to peddlers.

Q. There is what I call a straw-carrier that carries it down there? A. There is a belt that carries it out and tips it onto another and

is loaded into the wagons.

1017 Q. When you want to use that lumber, do you use it on that floor or take it below?

A. It is taken below largely.

Q. How is it taken below?

A. It goes down the elevator and then is wheeled behind the saw.

Q. It is on a truck and is loaded on the elevator and taken down

to the next floor and wheeled on that floor?

- A. Yes, sir, and there is a man that is manipulating the saw that does not get out of his tracks all day long. He stands there and shoves this lumber back and forth when the lumber is wanted to be cut.
 - Q. What have you got on the third story, what do you do there?

A. There are six or eight saws. Q. What are they for?

A. Cutting and ripping lumber.

Q. And making these shooks into the right size?

A. Yes, sir.

Q. Making shooks you have to make the ends and sides of the boxes the same depth accurately, do you not?

A. Have to work them to dimensions.

Q. Do you glue them together?

A. Sometimes.

Q. So that that room consists principally of a room where you make these shooks into the right dimensions?

A. The third story is devoted to the cutting of different lumber.

Q. To this cutting it up into the ends and sides of boxes? A. The ends are cut on the second floor.

Q. And you make the sides there?

A. Yes, sir.

1018 Q. What do you do on the second floor?

A. Cut the heavy work there.

Q. You have these two planing machines there to start with?

A. Yes, sir.

Q. What other work do you do?

A. Those machines are supposed to dress the lumber into widths and lengths on the floor for the heavy work.

Q. Where are your box shooks put into packages and bundles? A. Some of them on that floor and some of them on the third

floor.

Q. Are as many put up on the third floor as the second?

A. I should think there were more.

Q. You say your box shooks constitute about one-half of your business?

Q. And more than half of that, the finished product is on the third floor?

A. Yes, sir.

Q. If you want to ship those shooks at the present time, you hav to take them down in the elevator? A. Yes, sir.

Q. And take them out to this side track on the Michigan Cer tral?

A. Yes, sir.

Mr. Dickinson: Are they weighed outside?

A. Yes, sir.

Q. Before they go on the cars?

A. We weigh these shooks; that is on the lower floor.

Q. What have you got to weigh them with?

1019 A. Scale ten feet wide and 22 feet long; we weigh half car-load at a time.

Q. Do you have any difficulty in weighing them?

A. No, sir.

Q. Did you personally superintend the reconstruction of this mil in 1882?

A. I did.

Q. Did you personally plan and superintend the construction o your boiler and engine room and your dust and shavings room?

Q. I suppose you had had large previous experience in such things?

A. I always worked at it.

Q. Is it not true that what you call your dust-room is at the south end of this building?

A. The dust-room occupied 150 feet in length.

Q. There is a door, is there not, close to the street here? A. Yes, sir.

Q. With a gate? A. Yes, sir.

Q. Is not that the place where you load sawdust?

A. Yes, sir.

Q. It is not a place where you load shavings?

A. No.

Q. Will you state how you load that sawdust?

A. The principal part of it is shoveled—back the wagon right into the room and shovel it up and put their canvas on.

Q. Is it not a fact that the sawdust comes down in a pit in the rear of that entrance?

A. Yes, sir.

1020 Q. And you put it upon the wagon?

A. That building is a room 30 feet high, 20 feet wide and 60 feet long.

Q. Do you put that sawdust into the wagons with shovels?

A. I think most of it.

Q. That is a brick wall?

Q. It is a solid brick wall all round it?

A. Yes, sir.

Q. And the only entrance to it from the street is through this entrance?

A. Yes, sir.
Q. You have another place where you load shavings?

Q. That is some 50 feet back of the front line of the building, is it not?

A. I think it is just 60 feet from the front to that.

Q. What do you load there?

A. Shavings.

- Q. Does the building for shavings come down to the ground? A. The shavings are above and they come through a slide.
- Q. Is it not true that you back a wagon into that entrance and load it with a chute?

A. Yes, sir.

Q. So that the shavings come down from above into the wagon?

A. Yes, sir.

Q. As you would unload corn out of an elevator?

A. Yes, sir.

Q. Will you tell us whether or not this sawdust-room and 1021 the shavings-room have any opening between them, the two vaults. How do you get the shavings and sawdust apart?

A. There is a brick partition g ing clear up to the bottom of this

dust-arrester.

Q. There is a brick partition that runs up solid the whole distance?

A. Yes, sir.

Q. So that your shavings vault and your sawdust vault are two separate rooms?

A. Yes, sir.

Q. How do you take your shavings and sawdust from your mill into these vaults?

A. They are blown in there by large fans.

Q. Do these pipes across there represent the tubes through which the sawdust and shavings go?

A. They do.

Q. How many shavings vaults have you?

A. One large shavings vault.

Q. Have you separate pipes?

A. Yes, sir.

Q. That carry shavings?

A. One comes from one bin and the other the other.

Q You have one pipe that carries sawdust? A. Yes, sir.

Q. A smaller pipe at this end?

A. Yes, sir.

Q. So that your shavings and your sawdust are drawn from this mill through pipes and the draught is maintained with fans?

Q. You invented this dust-arrester, did you not? 1022 A. Yes, sir.

Q. Did you get a patent on it?

A. Yes, sir.
Q. You made a good deal of money out of it, didn't you? A. Made some.

Q. When did you get a patent on it? A. May 2, 1882.

Q. How many did you ever put in?

A. I could not tell you. Q. About how many?

A. I presume 80, a great many.

Q. You patented that when you rebuilt this mill? A. No, sir, before.

Q. How long before?

A. In 1882.

Q. You rebuilt the mill in 1882; when did you get the patent? A. It is on here in 1882.

Q. Are you still putting these in?

A. We do not give much attention to them. Q. When did you go out of the business, sir?

A. We have been giving our attention to something else.

Q. When did you go out of the business?
A. I did not go out.

Q. How long since you put in one of those for anybody else. You say you are not out of the business, let us see how long since you were in it?

A. I think within the past year.

Q. Whereabouts?

A. The last one, if I remember right, was put in in Wenona, Wis.

Q. For what firm?

1023 A. I can't tell you that.

Q. Don't you remember for whom you put it in?

A. I do not.

Q. How long ago was that?

A. I think it was about a year ago.

Q. Wasn't it two years ago?

A. I think not.

Q. How long before that did you put one in?

A. I could not tell you.

Q. Had you put in any, with the exception of the one you put in at Wenona, within two years?

A. I think not.

Q. Have you put in any, with the exception of the one in Wenona, within three years?
A. I can't tell you.

Q. Don't you know that you have not? A. Time flies faster than you realize.

Q. As a matter of fact, is it not true that this dust-arrester has been displaced by new inventions?

A. There is no doubt about that.

Q. So that while you have not gone out of the business, you have not been in the business for three years, have you, as a business?

A. That is about the size of it.

Q. And you own the patent still, don't you?

A. Yes, sir.

Q. Do you not know that a dust-arrester like this is a very dangerous dust-arrester, so far as fire is concerned, and that a number of mills have been burned up by them?

A. No, sir, I do not.

Q. Do you not know that it is the most dangerous dust-arrester known to the trade?

1024 A. I don't know that.

Q. Do you not know that this dust-arrester does not work satisfactorily or safely, and that other dust-arresters are being put

in generally all over this country?

A. No, I don't know any such thing. I do know this, that that dust-arrester is the most practical dust-arrester on the face of the continent today.

Q. You own the patent?

A. Yes. sir.

Q. You naturally are anxious to explain the merits of that?

A. Pay no attention to that.

Q. Don't you know that firm after firm throughout this country have taken those dust-arresters out and put in new ones, because they do not work satisfactorily, and because they were dangerous?

A. No, I don't know it that way.

Q. How do you know it; let us hear you state it?

A. A great many things, if you do not attend to them, they crowd you to one side. A thing that is defective, a thing that has no merit will take the place of a meritorious thing. This dust-arrester of mine has filled the bill. There are merits to this that people overlook. This runs without any power; it takes no power to run it. It gives absolutely free relief; it is very little trouble. It takes a little more trouble to put it in, but when it is built it is a perfect relief. There have been a great many establishments in the country that have had this and worked with it satisfactorily, and by and by they have been displaced by one thing and another, with something else which does not begin to fill the bill that this does. I have a good many, and I can give them to you where that has been the case; they have set mine out and put in the other, and then put mine back afterward.

Q. Name me a mill where they tried another and put

yours back?

1025

A. Sauger & Rockwell, of Milwaukee.

Q. When did they do that?

A. They built mine a good many years ago, and here is the letter dated June-

Q. I don't care anything about your letters. When did you put this in for Sanger & Rockwell?

A. Here is a letter-

Q. Will you answer my question, When did you first put in one for them?

A. It must have been in 1884.

Q. When did they take this out and put in another one?

A. A year ago I stopped at Milwaukee and called on them, and they said, Mr. Backus, we took your dust-arrester out because we were advised that this other plan would work better; but we find that we are much disappointed; it takes so much power to run the other that we think very strongly of putting yours back. This was Mr. Sanger. He said if they could have their way about it, they would replace it. He said it takes about 15 horse-power to run it more than it did with mine, that would be 30 horse-power.

Q. Have you finished your answer?

A. I am telling you the circumstances.

Q. Did you not just testify that you had——

A. Not-I had not got through.

Q. They told you that they thought of doing it—do you know whether they have?

A. I don't know.

Q. Then you were wrong when you testified they had put the others out?

1026 A. I did not so testify.

Q. Do you know what dust-arrester the firm of Sanger & Rockwell are now using?

A. A centrifugal motion. Q. It is not yours, is it?

A. I don't know, I can't say. They told me they thought of putting mine back.

Q. Did they ever apply to you for one?

A. They had one, they paid me for one.

Q. They never applied to you for leave to put in another?

A. They would not have to, they had the right.

Q. Is it not true that these new dust-arresters are in general use throughout this city and all other cities where planing mills and light machinery are in use?

A. They have been adopted in a good many cases.

Q. Do you not know that Mr. Thompson has the centrifugal?

A. I heard him say so.

Q. Do you not know that the Peninsular car works in this city had your dust-arrester in and took it out and put in a centrifugal?

A. They put in about 12 or 14 of them.

Q. And did that although the owner of the patent lived in the

same town?

A. Go ahead.

Mr. Charest: Did you ever receive any letters stating that the dust-arrester was a good one?

A. Yes, sir.

By Mr. BAKER:

Q. You received those when your dust-arrester first came out?

A. I have had letters lately.

1027 Q. Do you not know that if any one approved of your dust arrester lately it is because they did not know about the others?

A. I don't know any such thing.

Q. Do you not know, as a man of experience in this sort of thing, that your dust-arrester is absolutely worthless?

A. I do not.

Q. And is not in use any more?

A. I want you distinctly to understand that my dust-arrester has merits superior to the others. I can give you reasons for it. not run down anybody else, but I have a dust-arrester that absolutely fills the bill. There is no back pressure on it and it gives free relief every time. D. M. Ferry & Co. had my dust-arrester when they burned down, and it burned up.

Q. Didn't it set fire to the building?

A. The building set fire to that, and it burned up, and they put a centrifugal in, and they are using about 15 horse-power to run it.

Q. Is not the centrifugal dust-arrester a great deal safer than yours?

A. I don't know why it should be. Q. Do you testify that it is not safer?

A. In certain positions.

Q. Do they have any wood or burlap in connection with it?

A. They have dust all over the roof.

Q. This dust you refer to, isn't it on your inside?

A. In the other it blows out and settles all over the roof and all over the lumber yard and every place.

Q. Do you mean to say that the Peninsular car works and Mr. Thompson, and manufacturers generally, do not understand the merits of your dust-arrester?

A. I wish to be understood that they do not understand 1028the merits of mine, because they have got something that is cheaper.

Q. And that they think is better?

A. I don't know what they think; I know that it takes 15 horsepower to whirl it.

Q. With the exception of the Wenona case, do you know of a man that has put this in for three years?

A. I don't think any of mine have been put in in four years. Mr. Charest: Do you advertise your dust-arrester as a business?

A. We have made no effort to introduce it or to get it before the public in the past five years, but this man at Wenona wrote last summer and wanted permission to put it in, and we sold it to him. There are three of them at Wenona. He gave us \$160 for permission to put it in.

By Mr. BAKER:

Q. Is it not true that at one time you did a large and profitable business in putting in this dust-arrester?

A. We never neglected any other branch of our business.

Q. Is it not true that at one time you did a large profitable less in putting in the dust-arrester?

A. I can't answer that.
Q. Haven't you stated to me during this trial that you made

large amount of money out of it?
A. Yes, sir.

Q. If you were making money out of it, why did you go ou the business; will you explain that to this jury?

A. If a man wrote me from New York that he wanted me to in my dust-arrester if I would send a man down the

1029 would send a man down there to put it in; if a man we me from Hoboken, I did the same; from Green Point, I the same; from Bridgeport, I did the same; from Boston, I did same; from Wenona, I did the same—wherever they called fo That was years ago, and I never neglected my business to do it, when I got an order I sent my man to put them up. I put up so in Canada—several in Toronto; a big distiller in Toronto, twrote us and we put it in, and it was a daisy for them; and M& Co., of Toronto, put in one, and later on they were told that other was better than ours, and they took ours out and put other in; and later on they wrote and said they were very m disappointed in the other—the Cyclone, it takes more power twe can spare, and we think of putting yours back, and if you he any improvements to make, I recollect well, when you put it you did not build it according to your instructions, but shorte it up. He wrote he was on the point of putting in something of

it up. He wrote he was on the point of putting in something Q. You have stated here repeatedly, or undertook to have jury believe, that they had put yours back in there after try another one; will you name us a single firm that ever actus

did it?

A. Macy & Co., of Toronto, wrote us particularly in relation to

Q. Did they actually put yours in?

A. I don't know; I never was there after making the first of have not been there since.

Q. You don't know of a single case where they actually put yo back?

A. In my own case we have tested that thing-

Q. Will you answer that question? Can you name me a sin firm in the United States or Canada that took your machine that ever put it back, as a matter of fact?

1030 A. I don't think I can.

Q. When did you get the letters that you speak of, appring of your dust-arrester?

A. We will produce them.

Q. When did you get them?

A. I cannot say.

Q. More than three years ago?
A. I guess a less time than that.

Q. Do you not know that your machine has been generally oplaced throughout the United States and Canada?

A. I do not know it.

Q. Do you not know that it has largely been displaced?

A. No, sir.

.

Q. And that there are but few now in use?

A. No, sir, I don't know that.

Q. And is there any in use in this city besides yours?

A. Yes, sir. Q. Where?

A. Wilson Brothers, Clough & Warren. There are two or three others; I cannot name them. Backus & Company.

Q. Besides your own?

A. D. M. Ferry had it, and it was burned up.

Q. And they put in another kind?

A. Yes, sir.

Q. There are over a hundred planing mills and similar institutions in Detroit, are there not?

A. Oh, no.

Q. Did not Mr. Thompson testify to something like that?

A. There are not half of that.

Q. Do you know of any more than two dust-arresters, like yours, that are in use in this city, of the entire manufacturing industries of the city, where they need them?

A. They have got a similar one at the Michigan car works put up by Koch. He stole my right and went on and built it.

Q. What is that made of?

A. Fine cloth.

Q. Cheese cloth?

A. Yes, sir.

Q. Where was that put up?

A. Two years ago-it is the same principle.

Q. You have testified, have you not, that you have put up over 80 of these?

A. Yes, sir.

Q. And you put them up between 1882 and '85 and '86, did you not?

A. Yes, sir.

Q. Then the trade quit on you?

A. Because I didn't follow it up.

Q. Did you testify that the trade ceased because you did not press it; do you testify that the trade fell off because you did not press it?

A. A man could go in and put up the centrifugal on a wood-shed roof, and they would take it; they put them up in Grand Rapids, and they put them up in other places, and I have been there and seen them, and they would say it answers the purpose; but it takes a good deal of power.

Q. Is it not true that those dust-arresters drove you out of the business?

A. No.

Q. Do you testify to that, sir?

Q. Do you tell the jury that the other dust-arresters did not drive you out of the business?

1032 A. I can put up this dust-arrester today, by giving it my attention, and it is a better one than any of them. Q. You mean to tell the jury that you abandoned a profitable trade

voluntarily?

A. I could not neglect my main business. Q. You did neglect it for three or four years?A. No, I did not neglect it.

Q. Did you not follow up this business of putting in these dustarresters for three or four years?

A. No, sir.

Q. Did you not have a profitable trade in putting them in?

A. Certainly I did.

Q. And didn't you put them in all over the United States and Canada?

A. No, no.

Q. In a good many places in the United States and Canada?

A. I put in a good many, where I could get an opportunity to put them in; I sent a man to put them in.

Q. Is it not true that this new patent dust-arrester is made of

metal?

A. I have understood so-sheet iron. Q. And they are small in dimensions?

A. They do not take up very much room; that is what makes them so popular; they do not require much outside display.

Q. Is it not true that three of them could be put on your roof there in place of those burlap dust-arresters, and do the same work as these do?

A. No, sir, that is not true, could not do a quarter of it. Q. Is it not true that where they put this in it reduces the 1033 insurance?

A. I could not say; I do not know.

Q. Did you ever operate a mill with these new dust-arresters? A. I have tried it with ours where that open place was cut out.

Q. When did you try it? A. Three years ago.

Q. What dust-arrester did you try there?

A. One from Jackson.

Q. The machine made at Jackson?

A. Yes, sir.

Q. Who made it?

A. I can't tell you that.

Q. What other have you tried?

A. We tried that and we built three or four ourselves on the same principle.

Q. If you had the best dust-arrester in the world, what did you

try those for?

A. To satisfy ourselves in regard to the merits.

Q. Although you had the best in the world, you tried others?

A. We never knew it until we tried the others.

Q. How many others did you try?

A. That one from Jackson, and then we built three machines

after that and threw them all out.

Q. Did you ever employ the builders of any other patented dustarrester to put one in for you, as it ought to be, in your mill?

A. Yes, sir. Q. Who?

A. I can't tell you his name. He came from Jackson. 1034 Q. Is that the only one.

A. That was enough.

Q. Is the Jackson dust-arrester in general use?

A. I believe that is where it started from, the Cyclone dustarrester.

Q. Do you know of such a dust-arrester as the Vortex?

A. I don't know them by name.

Q. The only one you ever tried was the Jackson dust-arrester called the Cyclone?

A. Yes, sir.

Q. You say you value this building and machinery at \$150,000?

A. Yes, sir.

Q. What could that mill and machinery be duplicated for today?

A. Not a cent less, not a cent less. We can bring you the in-

- ventory, the bills all the way through, every item, and if necessary, we will do it. You cannot buy a machine for any less than we bought it. You cannot buy your brick for any less. You cannot hire your labor for any less. I did not charge a dollar for my labor.
- Q. Can that entire mill as it stands there today be duplicated for less than \$100,000?

A. No, sir, never.

Q. What is the machinery in that mill worth; what could you duplicate it for, right from the machine shop?

A. Not a cent less than we paid for it. Q. What did you pay for the machinery?

A. I could not tell you. I have not got it separate. We have got the bills and everything, and it foots up \$116,000. When we bought the brick, we bought it of Mr. Hall for \$5.50 a thousand.

A JUROR: Whether the machinery is free from the build-1035 ing, whether it can be removed. You claim it is just as good as new?

A. You could not move any of the machinery and ever realize half of it. The moment you move machinery it is second-handed.

Q. You claim it can be moved and used again?

A. Yes, sir.

Q. How high is your smokestack from the ground?

A. One hundred and fifteen feet.

Q. Do you know the height of the mill on the corner?

A. 42 or 45 feet.

Q. How many trucks have you for hauling lumber with teams?

A. I think we have 22; we had some burned up.

- Q. How many were burned?
- A. Two or four.
- Q. When?
- A. A good many years ago, when our mill was burned.
- Q. How many have you now, that you have used since 1882?
- A. I think 22.
- Q. Those are large trucks with rollers on them?
- A. Yes, sir.
- Q. So that you can slide a load off?
- A. Yes, sir.
- Q. What did those trucks cost apiece?
- A. Some of them cost us \$300, and some of them \$200.
- Q. What did they average?
- A. They will average \$200.
- Q. Can you buy those trucks new for \$200 apiece?
- A. Probably they would cost about that.
 - Q. What is their capacity?
 - A. All a team can handle—five or six tons.
 - Q. How many thousand feet of ordinary lumber?
- A. From 2,500 to 6,000.
- Q. What is the ordinary load for one of them?
- A. About 3,000 feet.
- Q. That is a good big load? A. Yes, sir.

1036

- Q. That is more than you take on an average?A. We hardly ever handle a load less than 2,500 feet.
- Q. What is the average?
- A. Say 2,700 or 2,800.
- Q. Is not that a little large?
- A. I don't think it is.
- Q. How many teams do you keep on hand when your mill is working to its ordinary capacity?
- A. Three teams will do the work in the lumber yard and the mill.
 - Q. How many teams have you in use?
 - A. Three teams.
 - Q. Six horses?
 - A. Yes, sir.
- Q. How many horses have you down there that are capable of going on these trucks?
 - A. Maybe we have four teams in all.
 - Q. At times do you have more?
 - A. No.
 - Q. Do you have to hire teams?
 - A. Often.
 - Q. What do your teams cost on an average?
 - A. When we hire teams we have to pay five dollars.
 - Q. What do they cost to buy them?
 - A. About \$550 a span would be the average.
- 1037 Q. You have very heavy horses?
 - A. Very nice horses.

Q. You use principally Clydesdales and Percherons? A. I use heavy horses. Some came from Canada.

Q. Most of them came from Canada; they are heavy draft horses?

A. Yes, sir.

Q. They will average more than \$250 apiece?

A. Pretty near \$300 apiece.

Q. They are the very heaviest kind of draft horses. How much do they weigh?

A. 1,600 or 1,700; 1,600 or 1,650.

Q. How many teams have you down there that are used in hauling lumber in the yard?

A. Three.

Q. I mean other teams?

A. We have four teams in all.

Q. That are in the truck business. How many teams have you that haul the products to town?

A. I guess we have five horses, or something like that.

Q. Where is your barn? A. At the warehouse.

Q. Do you keep all your horses there?

- A. We keep a span and three single horses; five horses there that we work.
 - Q. Where are the others; have you a barn down at the yard?

A. We have eight there. Q. And how many here?

A. Five.

Q. How many have you at the house?

A. Not any.
Q. None connected with the business? 1038

A. No, sir.

Q. Where do you keep that little white mare? A. At the warehouse.

Q. How many loads of lumber on the average do you take to your mill daily?

A. It is pretty hard to tell.

Q. You can tell us how many thousand feet you saw up there on the average?

A. I should think probably we took 30 loads a day.

Q. How many thousand feet?

A. There would be 25 or 2,700 feet to the load, as you figured that out, but a great many of those loads would be 3,000 feet.

Q. And thirty loads a day?

A. Yes, sir.

Q. So that there would be 90,000 daily?

A. Perhaps 80,000, sometimes 100,000, we would have no difficulty, if we needed them, we could draw 100,000 with three teams.

Q. You use those three teams, then, to take on the average from 80,000 to 100,000 feet of lumber daily to your mill?

A. We are getting some lumber that comes direct from the cars; it may be drawn from Twentieth street or from the Wabash.

Q. But it has to be hauled. Do you haul it with those teams?

A. Oh, yes; we have four teams.

Q. Four teams that are engaged in hauling lumber to the mill?

1039 A. No, sir; three teams that work to the mill, and other teams occasionally.

Q. What do you have to pay the man that drives one of those cams?

A. One dollar seventy-five, I guess.

Q. And he boards himself?

A. Yes, sir.

Q. How many oats do you give those big horses a day?

A. We give them four quarts in the morning and six quarts at noon.

Q. How much at night?
A. I guess four quarts.

Q. Could you keep them in good working condition on that amount of feed?

A. I think so. Somebody else can tell you about that better than

I can.

Q. That is 14 quarts a day?

A. Yes, sir.

Q. Do you feed them hay?

A. Yes, sir.

Q. About how many pounds of hay a day?

A. I cannot tell you.

Q. Do you keep a man in the barn there to take care of the horses, or does each man take care of his own team?

A. We have a watchman at night.
Q. Does he take care of the horses?

A. I don't know.

Q. Don't you know whether your teams are taken care of by a man that is there for that purpose or taken care of by the teamsters?

A. The foreman has charge of that.

Q. You have a foreman down there?

1040 A. Yes, sir.

Q. And you have a watchman?

A. Yes, sir.

Q. Have you a barnman?

A. No, sir; I think the teamsters do the work.

Q. And you have also another barnman at the warehouse?

A. Yes, sir; for a watchman.

Q. About how many thousand feet constitutes an ordinary car of lumber?

A. Probably 15,000.

Q. That is, the minimum is 10,000 and the maximum about 20,000.

A. Yes, sir.

Q. It would average 15,000?

A. Yes, sir; shipping a car-load of lumber 10,000 or 12,000 makes

a load; a large car will carry 15,000; a minimum car would be 10,000; we can ship a great deal of lumber by a car.

Q. 10,000 is regarded as the minimum load?

A. Yes, sir.

JUROR:

Q. What does your lumber cost you per thousand to haul from the yard to the mill?

A. We calculate it costs about eight cents a thousand to put it on

the truck.

Q. I mean the handling and all, after you get it on the truck?

A. You might say safely 20 cents a thousand will take it from the pile and put it behind the machine in the mill. That is a safe estimate.

1041 Mr. BAKER:

Q. How much is that for the hauling of the team?

A. 12 cents for hauling.

Q. 12 cents for the teaming?

A. Yes, sir.

Q. And eight cents for loading?

A. Yes, sir.

Q. And the unloading is done very easily?

A. That does not cost anything.

Q. You don't figure anything for shoving it to the machine?

A. The men that are loading, sorting, and all one kind is put on this truck at the particular time; it is going for a particular purpose.

Q. But you don't figure in that expense the wages of the man

that feeds the machine?

A. No, sir.

Q. You do figure the wages of the men that take the lumber at the pile and put it on the truck?

A. Yes, sir.

Q. And the teamsters?

A. Yes, sir.

JUROR:

Q. What would it cost by taking your lumber to the mill by rail-

road, per thousand?

A. That would tangle you right off. It will cost 12 cents to put the lumber on the car; I don't think that would do it; you see it has got to be handled twice; you have got to have a man to put it on the car, then it has got to be hauled to the mill by some power at some expense, and then it has got to be unloaded, and then it has

got to be put into the mill from the car, which would be an 1042 impossibility, the business could not be handled that way.

We sort our lumber when it is landed on the dock; the man there sorts the different qualities, widths, thicknesses, and this kind is put into one pile, and so on, No. 3, 4, 5, 6, this is rip lumber, this is resaw lumber, this is No. 5 lumber, that goes into box-work; and then when we have an order that comes for a carload of box shooks, we can make it out of No. 3, we send an order down, "Give us five loads of No. 3," and the men put it right on and it keeps coming.

Q. But I mean the same kind of lumber; I wanted to know what it would cost to take the lumber up from your mill to the car; you have stated what it cost by team; now I want to know what it would cost by car to do the same work, per thousand.

A. We would not handle it in that way.

Q. You can make an estimate?A. It has got to be put on the car.

Mr. BAKER:

Q. And it has got to be put on a wagon, has it not?

A. The lumber has got to be put on the truck and hauled to the car; this car is not where our lumber pile is.

Q. Is it in the yard?

A. The lumber is in the yard, but it has to be hauled 300 or 500 feet.

Q. But you have small trucks and it can be on tramways?

A. It cannot be hauled less than that. It is in a big pile, and put on the truck, and got to be taken on a car; that makes two handlings, and by the time you get it on the car it will cost you 16 cents.

By JUROR:

Q. You do not understand the question thoroughly. You have the lumber piled, and there are alleys between the piles?

1043 A. Yes, sir.

Q. Could you not place your truck right in the alley ?

A. No, sir; it could not be possible; it is not a practicable thing. Q. If it costs 20 cents with horses to take that lumber from your yard now, and take it right back of the machine; how much would it cost by rail to the same place; make an estimate, how much more would it cost?

A. In the first place, it would be an impossibility; it could not be done that way.

Mr. DICKINSON:

Q. Tell them what you think it would cost to do it.

A. It would cost 30 cents.

Q. And then you say it is not practicable at all?

A. It is not practicable; it is an impossibility. And we handle our lumber probably as cheap as it is possible to be done; I think I handle my lumber cheaper than Mr. Thompson.

Mr. BAKER:

Q. You say it costs eight cents a thousand to put it on your wagons?

A. Yes, sir.

Q. How much would it cost to put it on the cars per 1,000?

A. About eight cents more.

Q. Why do you add the eight cents?

A. Because it has got to be handled by two men, and it will take just as long to put it on the car as on the truck, from the pile; and, besides, we will throw the team-work in; we will not charge anything for that.

Q. Do you, in making your estimates, contemplate that you will use the teams down there for the purpose of loading

it into cars?

A. We never have, but I say I will give you that thrown in.

Q. But, in your own estimates, do you look at it that you should load it on your trucks there in the yard, to haul it in the cars?

A. Certainly, you could not do it any other way.

Q. Don't you know lumber yards where they have tramways and small trucks running on tramways all through the yard, by which they handle the lumber?

A. Yes, sir.

Q. Will you tell us why that could not be done in this yard?

A. Yes, sir, I will tell you. Three years ago I handled all our lumber from the vessels onto our dock, discharged every vessel myself; at the end of the season I figured it up and it cost me 13 cents a thousand; I went to Chicago, and I saw them doing it there, and it cost them 30 cents a thousand, as against my 13. I know it is an impossible thing to do it in the way you speak of; you have to have your trucks loaded, and we are not doing a business sufficient to make that outlay.

Q. Is it not true that in the lumber yards in Chicago they load the lumber onto the cars by means of trucks that run on tramways

alongside of the piles?

A. I never saw one, and I have been there a great many times,

Q. How do they load the lumber on the cars in the lumber yards?
A. Mostly by putting it onto wagons and drawing it onto cars.

There may be such instances as you speak of, but I never saw any.

1045 Q. You never saw any yard where they use tramways to load onto cars?

A. No, sir, I never did.

Q. Do you testify that it is usual in large lumber yards in Chicago to handle that from the piles to the cars by teams and wagons?

A. That has been my observation. There may be some exceptions where they do it that other way, but the most of them put it

onto wagons and draw it to the cars.

Q. Is it not true that in those large yards they have a large number of side tracks that run by the piles?

A. I presume there are.

Q. Where they load directly from the piles onto cars, without the intervention of a team?

A. Most of them handle it from these side tracks on the carts or wagons, and draw it on this platform.

Q. Most of them do it that way?

A. Yes, sir.

Q. Would there be any physical difficulty in putting tramways in your yard, up and down those alleys, so you could take your small hand trucks and load your lumber onto cars cheaply?

A. It would not be a practicable thing.

Q. Why?

A. Because it would make so much expense.

Q. What would make expense?

A. We have to sort, to have so many piles; we have 611 piles in our yard, 18 feet wide, and we have one kind of lumber in one pile and another in another.

Q. How many alleys have you running up and down there?

A. Seven alleys.

Q. Could you not have seven tramways running up these seven alleys?

A. Oh, you tire me, Mr. Baker. It would be absurd.

Q. Could you have them?

A. It would not be a practicable thing.

Q. According to your testimony, then, you are going to load this

all onto wagons in order to take it to the cars?

A. And onto trucks; you could not have your car right where you wanted it. We want 10,000 feet of this, 14,000 feet of that, or 2,000 feet, and so on.

Q. Why could you not load your cars and take them up and stand

them on a side track on your premises?

A. It would be an impossibility.

Q. And then slide them right to the machine, practically feed from the cars into the machine?

A. Mr. Baker, may I ask you a question?

Q. Yes.

A. When you will demonstrate to me the practicability of taking the steps that come up there, the stone steps, to get juto that large building, and set them up to come into this large building, I will make your plan a success; if you will put your steps and put your trap to the roof, if you will do that, I will tell you then.

Q. Do you want to submit your case upon that proposition?

A. Certainly I do, by all means. There is no sense to the proposition you are making me, that is to say, it is not a practicable thing; you cannot do it and make your ends meet; that is a positive fact; I have been through the mill 100 times and I know all about it.

Q. Did you ever try it?

A. Mr. William M. Dwight has.

1047 Q. Whereabouts?

A. Here on his lumber yard.

Q. What did he have there?
A. What has he got now?

Q. What did he have there?

A. He had everything at one time-those trams.

Q. Did he have trams and handle lumber the way I speak of?

A. He has got tracks, and then he handles it from those tram cars instead of the wagon.

Q. Is not the mill in operation?

A. Yes, sir; but does he make money?

Q. So that there is a mill in this city that is in operation just as I have suggested?

A. No, sir.

Q. Pretty near?

A. No, sir, nowheres near.

Q. Does he have tramways running to his piles?

A. That he shoves by hand on narrow cars; why I can beat him all out of sight.

Q. Just answer my questions and don't argue quite so much.

Has he got tramways?

A. What do you mean by tramways; will you tell me what a tramway is?

Q. What does he run those hand cars on?

A. A little track about two and a half feet wide.

Q. What do you call that?

A. A tramway.

Q. How many has Mr. Dwight got there?

A. I could not tell you; he has got them leading to different places.

Q. How much of a lumber yard has he got there?

A. It covers a good many acres. Q. Has he got a planing mill?

A. Yes, sir.

Q. What else?

A. I could not tell you.

Q. Does he receive all his lumber by rail?

A. Yes, sir.

Q. He has no shipping facilities by boat?

A. No, sir; he receives on side tracks, then he unloads onto these little cars, and then shoves them wherever he wants them.

Q. How does he feed his mill?

A. Brings it in on those little cars, I think.
Q. How long has that mill been in operation?
A. I could not tell you; a good many years.

Q. Is it in operation now?
A. I guess it is; I don't know.
Q. A larger mill than yours?

A. I guess not.

Q. As big as yours?

A. I think not.

Q. How much does it lack of it?

A. Three stories.

Q. All on one story?

A. Yes, sir.

Q. How much lumber do they manufacture there daily?

A. I could not tell you.

Q. How long is it since you were there?

A. I never was there to look through it much; I have been by there three or four times.

Q. Your local trade here is small compared with your aggregate trade?

1049

A. Yes, sir, compared with the aggregate.

Q. Your trade outside of this city, and in other States and Canada, is ten times greater than your local trade, or twenty times greater?

A. Three times greater.

Q. How many thousand dollars' worth did you sell to the local trade this last year?

A. I could not tell you.

Q. How many thousand dollars' worth did you sell to the trade outside of the city?

A. I don't know; our trade, perhaps, was \$300,000.

Q. \$300,000 worth? A. Yes, sir.

Q. The total sales?

A. Yes, sir; that is, net. Q. Do you keep a complete set of books down there?

A. Yes, sir. Q. Do you know what you have made and lost ever since 1871?

A. Pretty near.

Q. How many years of that have you done a successful, paying business?

A. I thrived very nicely up to the time we got burned out.

Q. How much did you make a year, before you got burned out, in 1882?

A. In 1877 I took my boys into company.

Q. I am asking you now how much you made a year from 1871 to 1882, the time you burned out?

A. In 1877-I could not tell you before that-in 1877 I took my boys in company, and the first year we made \$25,000.

1050Q. The next year?

A. \$35,000.

Q. The next year?

A. \$52,000.

Q. That is three years?

A. Yes, sir.

Q. What years were those?

A. 1877, 1878 and 1879.

Q. What did you make in 1880? A. I think it was \$50,000 in 1880.

Q. What in 1881?

A. \$70,000.

Q. What did you make in 1882?

A. That is the year we burned out.

Q. Do you know what you made, if anything? A. Yes, sir.

Q. How much?

A. Well, we made about the same, about \$70,000 or \$75,000.

Q. That is in 1882?

A. Yes, sir.

Q. Now, in 1883, after you got rebuilt, how much did you make then?

A. We were burned out; we lost our grip.

Q. You rebuilt it right off?

A. Yes, sir.

Q. What did you make?

A. Since that time, we have just got catched up.

Q. What did you make in 1883?

A. I could not tell you?

Q. What did you make in 1884?
A. I could not tell you.

1051 Q. What did you make in 1885? A. I could not tell you.

Q. What did you make in 1886?

A. I could not tell you.

Q. How much did you make in 1887?

A. I could not tell you.

- Q. How much in 1888?
- A. I could not tell you.
- Q. How much in 1889? A. I could not tell you.
- Q. How much in 1890?

. A. We made about \$27,000.

Q. How is it that you can tell what you made in 1890 and cannot tell for the five or six years previous to that?

A. The reason is that we were struggling to get this thing catched

up, and we didn't strike any balance.

Q. Didn't you lose money all those years?

- A. Will you tell me? I think we didn't make any money for the past five or six or seven years before that; we just lived and held our own.
- Q. As a matter of fact your institution was run without a profit for five or six years?

A. Yes, sir.

- Q. And you could only show a balance on the profit side in 1890.
 - A. Yes, sir.

By JUROR:

Q. Did you sell any lumber at the yard?

A. Oh, yes.

Q. Was that profit all made from the mill?

A. We put all in together.

1052 By Mr. BAKER:

Q. The whole business is in the name and belongs to this corporation, known as A. Backus, Jr. & Sons?

A. Yes, sir.

Q. The entire business, the warehouse, the factory and the lumber yard?

A. Yes, sir.

Q. The warehouse is simply a place to store the finished product principally, that is, the dressed lumber and the ceiling, etc.?

A. It takes the overflow from the mill.

Q. That is mostly retailed out here in the city?

A. Yes, sir, largely.

By JUROR:

Q. When you said you didn't make anything during five years, you mean to say that you have lost \$100,000?

A. We had to pay up for building this mill.

Q. You didn't lose anything then?

A. No, sir; we just held our own, and lived, and paid our debts.

By Mr. DICKINSON:

Q. What was your insurance on that fire?

A: \$38,000.

Q. What did your mill cost you?

A. It cost \$116,000 to build the mill, but there was probably \$30,000 worth of lumber in the mill; we had a finished product ready to ship to the Lorillard people at that time.

By Mr. BAKER:

Q. I have this witness and will continue my cross-examination. Mr. Backus, do you mean to say you were paying for the mill during these years?
A. Yes, sir.

1053 Q. Do you mean to say that your business showed a profit in these years where you said you could not tell what you made?

A. Well you can see. It absorbed this-

Q. What absorbed?

- A. What we made was absorbed for the paying for the building of this mill.
- Q. When you rebuilt that mill you used your insurance money, didn't you?

A. I suppose we must.

Q. Did you borrow money ?

A. Oh, yes.

Q. During those years do you mean to say that you paid your indebtedness?

A. Just about.

Q. That you kept paying on the principal?

A. Just about; well, we had to pay and get up again.

Q. Don't you owe just as much money now as you did in 1882?

A. I think probably just about.

Q. Is it not true that for five or six years there you didn't make any money in that mill?

A. Why, I said that half a dozen times.

Q. That is the way I understood you, Mr. Backus.

A. Yes, sir.

Mr. Baker: I would like to ask Mr. Backus a few more questions in the morning; but Mr. Joy is here now, and I want to put him on now, because he wants to go to New York tomorrow, and he may go to Europe, and I won't have an opportunity to examine him unless I do it at this time.

The examination of Mr. Backus was discontinued for the present,

and Mr. Joy took the stand.

1054 James F. Joy, recalled in behalf of petitioner.

Examined by Mr. BAKER:

Q. I believe you testified when you were on the stand before that you drafted this law of 1881, by which the property of one railroad company may be condemned by another railroad contany under certain circumstances.

A. I don't think I testified that. I said I might have drawn it.

Q. What is your recollection now about it?

A. I am not certain that I drew it now. I might have drawn it. Q. Do you think you understand the provisions of it?

A. I think I understand them perfectly.

Q. As a railroad man, will you tell us whether or not the Fort Street Union Depot Company, or any other corporation, could condemn a margin of the Michigan Central railroad property down there for a union depot or other railroad purposes?

A. They could not.

Mr. Dickinson: We desire to object to this as testimony as to a conclusion of law, which is a usurpation of the province of the jury; and as in any case incompetent testimony, for a lawyer to go upon the stand and swear what the law is, especially if he is interested. And we take an exception.

Q. You are a member of the bar?

A. Yes, sir; I have practiced law a great many years.

Q. And you have been connected with the railroad business ever since you left the general practice of your profession?

1055 A. Yes, sir.

Q. Will you tell this jury why the Fort Street Union Depot Co. could not condemn a right of way along the margin of the Michi-

gan Central property?

A. There are two reasons; one of them is that by general principle of law, when the property has been appropriated to a public use by one corporation, under authority of law, on general principles—and it is universal law—no other company can go and condemn that property, or any part of it.

Mr. Dickinson: Not by express statute?

A. I speak of the general principles, and by common law. A legislature, if they deem that it is important to take the property of one company and give it to another for the public use, in the special 78-55

exercise of a power for that purpose, can condemn it, just the same as if the Government wanted to erect a fort for national defense upon the Michigan Central grounds; the public defense of the country is more important than the business of the Michigan Central, and the Government might take it to place a fortress there for the purpose of national defense; if they deemed it necessary for the public use, the Government of the United States might do that.

Q. Under a statute?

A. Yes, sir; but it would have to be an express purpose, passed on purpose, and for nothing else.

Mr. BAKER:

Q. I suppose you have been familiar with the legislation in this State ever since the State was organized?

A. All the time, sir.

Q. You were here when the State was a Territory?

A. I was.

1056 Q. Will you state whether the legislature of this State—and I suppose you are familiar with the statutes—

A. Yes, sir.

Q. —has ever passed any statute or any law under which the Fort Street Union Depot Company or any other corporation, could condemn a right of way along the margin of River street or any

other place, through their grounds?

A. They never did; and this law which Mr. Dickinson asked me a question about the other day, I wish to explain it. He brought this law to my notice the other day. This law is drawn with reference to the general principles of common law, and if I drew it I could not have drawn it more carefully than it is drawn, to protect one company from the invasion of another. I will read it: "When any part of the land of any railroad company in this State, in or adjacent to its depot grounds, is not in actual use for depot or other purposes pertaining to the operation of a railroad, and such land is not needed by said railroad company for the purpose of a depot or other terminal facilities, it shall be lawful for any other railroad company organized as aforesaid, needing such land for the purpose of a depot or terminal facilities, to acquire the same in the same manner as may now be done for such purpose from individuals." First, it must not be in actual use, and then if it is not needed; there are two considerations. In the first place, if it is in actual use, you cannot touch it; and if it is not in actual use, but is needed by the company, you cannot touch it. Those are subjects to be controverted, and when you come before a jury, or when you go before a judge to ask for a commission to condemn the property, you would have to allege in this case, if you wanted to condemn any

portion of the Michigan Central ground; suppose you wanted to condemn their whole front, you would have to allege in your petition that it was the property of the Michigan

Central.

Q. That is the fact?

347

A. Yes, sir. I have done it a hundred times. These petitions are familiar to me.

Q. But you know that is the property of the Michigan Central?

A. Yes, sir; I know it. Q. You know it is in use?

A. Yes, sir; I know it is all in use.

Q. Now, could any one truthfully swear to a petition under that statute?

A. No, sir; of course the law requires that it shall set forth who owns the property; if it belongs to the Michigan Central Company, you must state that, and you must state that it was not in actual use, and you must also state that it is not needed, in your petition. If you do state those things in your petition, the law gives the opposite party the right to come in and controvert that fact; they would join issue before the judge; one would allege that it belonged to the Michigan Central Company and was in actual use, and if it was not in actual use, would allege it was needed for that company; if that appears, that it was not in actual use and not needed, the opposite party has a right to controvert the fact, and in his answer he would say that it was in actual use, and then it would be tried by a judge, and if it was in actual use, no judge would issue an order to condemn it.

Q. In order to institute any such proceeding, it is necessary to swear to the petition?

A. Yes, sir.

1058 Q. Would not that of itself be an insuperable obstacle to the condemnation of a right of way along the property of the Michigan Central?

A. It would unless you could assume that some one would file a petition and swear that what was in actual use was not in actual use.

Q. It has been my practice to verify that; some attorney or officer of the company has to swear to that?

A. Yes, sir, always.

Q. And the very first step to condemn land would be that the attorney or officer of the company would have to commit perjury, to take this step?

A. Yes, sir.

JUROR: What difference is there between a charter for a street car company, given a street car company for 30 years, say, and a charter given to a railroad?

A. A street car company does not condemn property at all. They have no right to condemn. They are not similar things at all; they do not condemn property at all.

Mr. Dickinson: They are authorized in Bay City by their charter.

Juryman Charest says he wants to know the difference between a charter given a city railway and a charter given a railroad.

By Mr. BAKER:

Q. Is it not the settled law in this country that where an ordinary horse street railway is built along a street, and the street is wide

enough to accommodate them without any special injury, that street railways may be built in the street without paying the adjoining proprietors damages?

A. I think that is the law always.

1059 Q. You are familiar with the history of this city, and no street railway company in this city ever paid the adjoining proprietors anything?

A. No, sir; they acquire no exclusive property at all.

Q. But under some recent decisions of the supreme court, if a street is so narrow that a team cannot pass between the curb and the car, where there are peculiar circumstances, there are some indications that they would require them to pay damages; that is the present situation of it?

A. That may be, but that is not the usual law.

Q. There was a controversy in New York in regard to the elevated roads, and it was finally settled that, because of the way they are constructed, they have to pay damages to the adjoining proprietors?

A. But the surface roads do not.

Q. The Broadway railway was built without paying any damages

to the adjoining proprietors?

A. Yes, sir; and so were the other street railroads. The difference between a street road and where a railroad company acquires a large quantity of land for a yard is this: a street railroad acquires no property in the street; they acquire simply a right to run along it; they cannot shut anybody else out of it; they cannot prevent the city granting any other rights which is not inconsistent with theirs; the city can grant, I think, a right to build an elevated road right over the other roads, simply because the roads below have no property there at all; they have a right to run along the street as we have; a right to travel along there; nothing but a right of way; when you get to a piece of property like the Michigan Central yards,

to acquire or condemn—and a great deal of the Michigan 1060 Central yards were condemned for public purposes by that

company—when you want to go and touch that property, if you ever do want to go and touch it, you have got to get some law to authorize you to do it; the laws, as they exist, do not authorize you to do it; and this law which Mr. Dickinson brought to my notice recognizes that fact, and it says that when the property is not in use by another company, and when it is not needed by another company, then a new railroad company may take that part which is not in use and not needed, but they cannot touch the ground which they use and occupy. That is not only the general principle of law, but the actual statute.

By JUROR:

Q. Does the Michigan Central Railroad Company use the space in the air?

A. You cannot set your posts on the Michigan Central; it is in use there; they have a right to build freight-houses; they intend to build freight-houses, they assure me, down clear to the passage where the railroad crosses River street.

Q. Do they need them now?

A. They need every inch there; they have a right to use it to build their freight-houses there.

Q. They could build the freight-houses under the elevated road?

A. No, sir; they could not do that.

O. They have stores and hotels under the elevated roads in Ger-

many, in Berlin?

A. I don't know anything about that, that may be; but you cannot in this city or in this country condemn the land for the purpose of setting posts there and run over it, to say nothing of other inconveniences.

By Mr. BAKER: 1061

Q. Is there any legislation that would authorize you to build an elevated road across their property, as distinguished from a surface road?

A. None whatever.

Q. That is, the limitation is general? A. The limitation is universal.

Q. That is, if the legislature would pass an act authorizing you to go overhead, it could not be done?

A. If they specially did it; yes, sir.

Q. But they never have?

A. No, sir.

Q. So that they have given no authority to either go on the surface or overhead?

A. No, sir, not at all.

Q. This company was organized in July and August, 1889?

A. Yes, sir.

Q. And there was a session of the legislature that had ended that vear?

A. Yes, sir.

Q. And you have been proceeding as rapidly as possible with this union depot and with this route ever since?

A. Yes, sir, we have.

Q. And you had to lay out your route, make your survey and lay out your route under the law as it then stood?

A. We could not do it otherwise.

Q. And you could not do anything without complying with the then statute?

A. No. sir.

Q. So that the years 1889 and 1890 elapsed before the legislature met again?

A. Yes. sir.

1062Q. And in the meantime you had progressed with this work?

A. Yes, sir; we were compelled to progress because we were required to finish it within a certain time.

Q. Do you think it would be possible for the Fort Street Union Depot Company to get a bill through the Michigan legislature authorizing you to go over the property of the Michigan Central railroad?

A. No, sir; it would not be possible.

Q. In the first place, any such legislation would have to be by general law?

A. Yes, sir.

Q. And if you undertook to curtail the facilities or the business

of the Michigan Central it would meet with general opposition?

A. Oh, it would be opposed everywhere. There is no possibility of getting any such act at all.

Cross-examination by Mr. Dickinson:

Q. You say that the general rule throughout the country is that an ordinary street railroad, for horses, can run upon the streets without condemnation?

A. As a rule, yes, sir.

Q. Is that the rule in New York State?

A. It is in the city of New York. Q. In the State of New York?

A. I think it is in the State of New York.

Q. You are as positive about that as of any legal proposition you have made here?

A. No, sir; not as to the law of that State.

Q. Did you know that in Bay City the supreme court had sustained an injunction against the horse railway company laying a track before the property it had not condemned for

a horse-railroad track?

A. I didn't know that; but I will tell you what I do know about Bay City. The Bay City railway, by its organization, has a right to use a locomotive on that road.

Q. I am talking about the street-car road in Bay City.

A. I speak of that; I speak of what is a horse car in the daytime

and a locomotive in the night; that is Bay City.

Q. I speak of the horse street railway. Now, Mr. Joy, would it surprise you, after your statement on direct examination as to the rule in New York, to know that the court of appeals held there that a horse-car road could not be put through the streets of a city without condemning the right of way as against abutting property-owners?

A. If it is the law, it is under some special statute.

Q. You would be surprised at that?

A. No, sir; there is some special statute. Unless there is some special statute, I would.

Q. In this State did you get any authority for the union depot company to build an elevated road?

A. The order of the commissioner.

Q. Did you get any authority by law to build an elevated road?

A. We got authority to build a railroad. Q. Nothing about an elevated road?

A. No, sir; but that is settled by the commissioner. The commis-

sioner has a right to order it, and so the supreme court said; he has a right to order that we should build it up in the air.

(). The commissioner can always, for a crossing, order any kind

of a crossing, to protect the public from danger?

A. Not any kind.
Q. He can order the crossing to be made overhead, as he 1064 did here?

A. Yes, sir.

Q. It had nothing to do with the question of whether you were going to build a surface or an elevated road; the commissioner could order you to make a crossing in a certain way, under the statute?

A. He could order us to make a crossing above grade or below.

Q. Now you say that the general rule is, the universal rule is, that where property has been taken for one public use, it cannot be taken for another public purpose without authority from the legislature?

A. Yes, sir.

Q. Will you please tell us hether you know that under the

A. The railroad companies are under general law.

Q. You could not pass a special act conferring a right upon the union depot company to take a portion of the Michigan Central property?

A. No, sir.

Q. Special legislation is forbidden by the constitution, is it not? A. Special legislation for corporations is prohibited, but the

legislature might, if they saw fit, in a general law, provide in certain circumstances, and upon certain proof, that a court might authorize them to condemn property.

Q. I will ask you whether this legislation would be valid under the constitution of the State: An act to provide a right of way for the union depot company by taking part of the depot grounds of

the Michigan Central Railroad Company, and going on, section by section, to provide that the Fort Street Union Depot Company might take that property of the Michigan

Central Railroad Company. Would not that act be unconstitutional, because it is special legislation?

A. If it was special legislation authorizing a certain company to do that, it would be. Q. So that the only way would be to pass a general act that

would apply to all companies?

A. Yes, sir.

Q. And you think that if a general act was passed providing that the property of one company might be taken by another, that would be legislative authority sufficient for the purpose?

A. No, sir.

Q. Then how are you going to get your legislation?

A. I don't think you can get it.

Q. Do you mean that because it is unconstitutional or because you cannot get the legislature to do it?

A. In the first place you could not get the legislature to do it; that would be impossible. What I know is, that it never has been done in the world.

Q. Was it not done in Massachusetts, in a special case, where the

situation was different from ours?

A. They have a right to pass a special act-

Q. Suppose the legislature was willing; you speak of the legislature refusing to do it; but suppose the legislature should pass an act providing that one railroad might take the property of another railroad company, upon making a showing that it was needed, would that act be valid, would that act be constitutional?

A. Do you mean a specific piece of property?

Q. Providing that one railroad company under the cir-1066 cumstances named in the act might take the depot grounds of another railroad company?

A. I don't think it could be done here.

Q. Could you make a constitutional act by which you could take the property of the Michigan Central?

A. I am not discussing questions of constitutional law. I know

it has never been done and cannot be done.

Q. If you cannot pass special legislation, will you tell me what constitutional act could be passed?

A. That section especially provides you shall not take any spe-

cial property.

Q. Suppose the Michigan Central was fenced off, and they were not using it and they did not need it, you would concede that you could do it under this section?

A. Yes, sir.

- Q. And you could not do it if that section was not passed? A. I think if they were not using it and did not need it.
- Q. If they did not need it and did not use it, you could take it under this section which you think you drew?

A. I think so.

Q. Do you remember why you drew that section?

A. I don't think on the whole that I did draw it, but if I did do it, I could not have drawn it more carefully to protect the rights of the depot company.

Q. You have read that second paragraph?
A. Yes, sir.

Q. "The question of actual use and of necessity for the aforesaid purposes by said railroad company owning and not using said land, shall be determined in addition to other questions as provided by law in cases of condemnation of land for the purpose aforesaid,

and the same proceedings in all respects, as near as may be, shall be had for the aforesaid purpose as now provided by

law where land is acquired for such purpose from individuals." Will you tell us to what tribunal shall be referred the question of such use and necessity; what are the same proceedings as herein referred to; is it by commissioners or by a jury?

A. It is a petition to the court.

Q. Is it finally to be referred to commissioners or to a jury?

QA7

A. No. sir.

Q. Just read that portion of the law which provides for a trial, which is referred to there. You have got to file a petition that it is not needed and is not in use.

Mr. BAKER: And they deny it of course.

Q. Where does it go to be determined. You are familiar with this railroad practice?

A. Yes, sir.

Q. Is it not the general railroad law under which you have practiced for forty years?

A. Yes, sir.

Q. Just refer back to what proceedings will be taken?

A. I will. Here it is. (Witness reads from General Railroad Laws:) "In case any railroad company is unable to agree for the purchase of any real estate, property or franchises required for the purpose of its incorporation, it shall have the right to acquire title to the same in the manner and by the special proceedings prescribed in this act; but there shall be no power, except for crossing, except to take the track or right of way of any other railroad company, except when any road-bed or part thereof has for five years remained, or shall hereafter for five years remain, in an unfinished condition, and without having the ties and iron placed and continued thereon

up to the time measures are instituted to appropriate the 1068 same as hereinafter authorized, any other railroad corpora-

tion shall have the right to acquire title to the same and to the real estate and easements held by such company for use in connection therewith, in the manner prescribed for obtaining other property or franchises required for its use, and in such case proceedings may be instituted in a court of record in any county wherein a part of such road-bed sought to be acquired may be situate, and all of such road-bed and property aforesaid within this State, or only a part thereof, at the election of the applicant, may be included in one proceeding." That is, where the road is not finished.

Q. But as to the trial of the question?

A. "For the purpose of acquiring such title such company may present a petition to any court of record for such county, praying for the appointment of three commissioners. Said petition shall be in the name of the company, shall be signed by one of the directors or the engineer, or the attorney of said company on its behalf, and shall be verified by the oath of the person so signing the same, and shall contain the description of all the real estate, property or franchises, or so much thereof as the company seeks to acquire under such petition in said county; and that said company is duly incorporated; that it has a railroad, or a railroad tunnel constructed, specifying the points from and to which the same is in operation, or that it is the intention of said company, in good faith, to construct, finish and maintain a railroad or a railroad tunnel from and to the places named for that purpose in its articles of association; that the capital stock of the company has been in good faith subscribed by this act to organize such company;

that the company has surveyed the route of its proposed road in said county, or of its railroad tunnel, as the case may be, and

made a map and survey thereof, by which said route is designated; and that it has located its said road or railroad tunnel, according to such survey, and filed a certificate thereof, signed by a majority of the directors of said company, in the register's office in said county; that the property described in the petition is required for the purpose of constructing, operating or repairing the railroad, or its appurtenances, or the railroad tunnel or its appurtenances, as the case may be; and that the taking thereof is necessary for the public use, and that the company has not been able to acquire title thereto, and the reason of such inability. The petition must also state the names and place- of residence of the parties, so far as the same can with reasonable diligence be ascertained, who own or claim to own and have estates or interests in said lands or property; and if any such persons are infants, their ages, as near as may be, must be stated, and if any of them are idiots or persons of unsound mind, or unknown, it must be so stated, together with such other facts and allegations as to encumbrances or otherwise, as will be sufficient to show who have or claim to have interests in said lands, real estate or property, and such other matters as the company may see fit to A copy of such petition, with a notice of the time and place, when and where the same will be presented to such court, must be served on all persons whose interests will be affected by the proceedings, at least ten days prior to the presentation of the same to the court, as follows, viz., first, 'If the person on whom service is to be made resides in this State, etc.;' that is immaterial; second, 'If any person on whom such service is to be made is under the

any person on whom such service is to be made is under the 1070 age of 14 years, etc.;" that is immaterial. The third, fourth and fifth subdivisions here are immaterial. Section 20 is, "On presenting such petition to said court or the judge thereof at chambers, with proof of service of a copy thereof, and due notice as aforesaid, all persons whose estate or interest are to be affected by the proceedings may show cause against the prayer of the petition, and may disprove any of the facts alleged therein, and said court or judge shall hear the proofs and allegations of the parties, and if no sufficient cause is shown against granting the prayer of the petition, said court or judge shall make an order appointing three disinterested and competent freeholders as commissioners to ascertain and determine the necessity for taking such lands, franchises or other property, and to appraise and determine damages, or compensation to be allowed to the owners and persons interested in the real estate or property proposed to be taken in such county for the purposes of the company."

Q. Read the jury clause there?

A. Yes, sir.

Q. You will see we are not bound to take commissioners, but may

demand a jury under that statute?

A. You have a right to demand a jury, but it goes to the court first, and the judge is to consider whether that petition is to be granted. That is the law. The parties have a right to contest the facts set up in the petition before the judge. Now, suppose you filed a petition to condemn a portion of the grounds of the Michi-

gan Central railroad, it comes before the judge; the judge is to determine whether commissioners are to be appointed; that is his

duty; if it appears that you are seeking to condemn the yard of any other railroad company actually used by that company, 1071 the court will say your petition shall not be granted.

Q. You think the court would?

A. Yes, sir, certainly: and is bound to do it, could not help doing it, because you have to state those facts, and the law expressly prohibits the issuing of a commission to condemn the yard of another company; you cannot do it at all; it would never get to a jury in the world.

Q. You have read the provision as to the point of commissioners. Where and by what tribunal, at the election of any de-

fendant are the questions of fact to be decided?

A. The questions of fact are to be decided by the judge, so far as those questions are concerned, always.

Q. You think by the judge? A. Always; the law so states.

Q. The law states that you can contest the facts stated in the petition, as to whether there has been a proper negotiation to come to an agreement?

A. You could contest every fact.

Q. Suppose a petition is filed by the Fort Street Union Depot Company against the Michigan Central, and verified, stating that the Michigan Central does not need or use this property, this margin, and the Michigan Central came in and asserted that they do use and need it, to whom does that question of fact go?

A. That question of fact is settled by the court.

Q. Then you say that this provision refers to the court? A. Yes, sir.

Q. "The question of actual use and of necessity for the aforesaid purposes by said railroad company owning and not using said land shall be determined, in addition to other questions as pro-

vided by law in cases of condemnation of land for the purpose aforesaid, and the same proceedings in all respects as near as may be, shall be had for the aforesaid purpose as now provided by law where land is acquired for such purpose from individuals." Do those proceedings referred to in that section refer back to what you have read?

A. Yes, sir, exactly; they cover it; and when it appears before the court that you seek to condemn the land belonging to another railroad company in actual use, the court will not let you go any

further.

Q. The proceedings are similar to the proceedings taken in this case?

A. Yes, sir.

Q. Will you tell us when you filed a petition in this case to condemn a right of way in front of Mr. Backus' property, what the court did with your petition?

A. Hand me that book again.

(Counsel hands book of statutes again to the witness.)

Q. How did we get here to the jury? A. The court appointed a commission.

Q. In this case?

A. No, sir, not here; they got a jury.

Q. Will you please tell us when you filed your petition against Backus in this case, how the court came to order this jury?

A. Simply because you demanded it.

Q. To pass on what question?

A. To assess the damages Mr. Backus might sustain.

Q. Anything else?

A. Whether it was public necessity to have this route come up here.

1073 Q. Did the court undertake to decide that in the first place, whether it was a necessity?

A. I think they referred it to the jury.

Q. If the question of whether the depot company whose lands are sought to be taken needs the property or uses it, shall be referred and treated in the same way as in the case of the condemnation of the property of private individuals, it would come up in precisely the same way?

A. No, sir; I think not. I think it would appear before the court in a petition. That court would never refer it to a jury. That is a

question for the court, not for a jury.

Q. What is there for the court in this case you are trying here? A. Public necessity.

Q. For the court?

A. The court was to ascertain first certain things-

Q. When in the world, in your history as a railroad lawyer, did any judge pass upon any question of necessity under the constitution of 1850?

A. I mean they referred those questions to this jury.

Q. Has any judge in the State of Michigan a right to pass upon the question of necessity?

A. No, sir.

Q. Or to pass upon the question of damages?

A. I think not.

Q. Does not the constitution of this State say that the question of

necessity and use has to be referred to a jury?

A. Those questions are; but if there is any good reason in the mind of the court why the petition should not be granted in full, the court does not grant it to a jury.

Q. But in practice, does not that go to the constitutional question

of whether the petition is in proper form?

1074A. No, sir, it goes to all questions of fact there are there.

Q. Suppose some one should go into court and make his appearance before the judge, and deny the question of public necessity, and the necessity of taking his property, would the judge pass upon it?

A. No, sir; I think he would refer it to a jury; but if you attempt

to assess lands which are used as a depot by another company, then the judge would have to pass upon that; he would not refer that to a jury, because the law especially prohibits that no commission shall be issued to condemn land under such circumstances.

Q. Does it?

A. Yes, sir.
Q. You have read the law. Will you refer to it again. I will read the section and you will see it does not cover the question.

Mr. BAKER: It says there shall be no power except for a crossing.

Q. This act that you read from was passed many years ago, was it not?

A. Some years ago.

Q. Section 17 here provides—of the old general railroad act, still in existence, as follows: "In case any railroad company is unable to agree for the purchase of any real estate, property or franchises, required for the purpose of its incorporation, it shall have the right to acquire title to the same in the manner and by the special proceedings prescribed in this act; but there shall be no power, except for crossing, to take the track or right of way of any other railroad company, except when any road-bed or part thereof has for five years

remained," etc.; does that refer to depot grounds?

A. That does not. I did not read it for that purpose.

Q. That provides that it shall not be taken. It would seem to assume that it might be taken for something else, that any other property might be taken, because it only provides that you shall not take the track or right of way. Is there any prohibition against taking the property of another railroad company, in that general act, except that; is there any prohibition against a railroad company or a depot company or any one else taking the property of another railroad company, except the provision against taking its tracks or rights of way?

A. Yes, sir; this is a prohibition: "When any part of the land of any railroad company in this State or adjacent to its depot ground, is not in actual use for depot or other purposes pertaining to the operation of a railroad, and such land is not needed by said railroad company for the purpose of a depot or other terminal facilities, it shall be lawful for any other railroad company organized as aforesaid, needing such land for the purpose of a depot or terminal facilities," to acquire it by condemnation, but you shall not in any case

when it is occupied by any other company.

Q. It does not quite say that?

A. Yes, sir, those are the exact words.

Q. But is there any prohibition against taking the property of another depot company, except the prohibition against taking the track and right of way; is there anything else except what you have just read?

A. I don't think of anything else just now.

Q. Those two sections, section 17 of the old railroad act and section 44 which you have just read, are the only provisions?

A. I think there is another provision which I can refer you to: "In case any railroad company is unable to agree for the purchase of any real estate, property or franchises required for the purpose of its incorporation, it shall have the right to acquire title to the same in the manner and by the special proceedings prescribed in this act; but there shall be no power except for crossing to take the track or right of way of any other railroad company," except by the consent of such company.

Q. That is the only thing. That is a repetition of the same

thing?

A. There is a provision against taking the track and against depot grounds.

Q. The prohibition against taking depot grounds is the one?
A. That is the act that prohibits it.

Q. The act that I called your attention to, and that you may

have drawn yourself?

A. Yes, sir; but also by general law, always universally you cannot take the property which has been appropriated to public use by one company, to appropriate it to the same public use by another, unless you have a special act authorizing it to be done.

Q. But you cannot have a special act in this State?

A. But you can frame a general act to cover the conditions under which it could be done; you could draw an act, and so could I, as a general law, that under certain circumstances you might take the property of another company.

No answer.

Redirect examination by Mr. BAKER:

Q. Is it not true, as a general rule of law, that railroad and other corporations only have such powers as are conferred? 1077

A. Yes, sir.

Q. That is, in order to exercise the right of eminent domain at all, they have to have it granted to them by the legislature, either by a general law or a special act?

A. Yes, sir.

Q. Now, in this State, there has never been any legislation that authorized one railroad company to take the property of another, except for a crossing?

A. That is all.

Q. There has never been any authority conferred upon any road or depot company to build an elevated road across the property of another?

A. No, sir.

Q. And in the absence of such authority it cannot be done?

A. It could not be done unless-I don't think it could be done in any event, but if you could span from side to side of the Michigan Central depot grounds, if you wanted to cross them and put a span so as not to touch their grounds, they might grant such power.

Q. Would it be possible to make such a span?

A. I don't think it would.

Q. But there has no authority ever been conferred to do any such thing?

A. There has never been any authority, or anything like it ever

been passed by the legislature of this State.

Q. And every act that has been passed, all the legislation that exists, especially provides that you shall not do it unless it is not in use and is not needed?

A. Yes, sir.

Q. With reference to legislation, under our constitution, 1078 it would be necessary to make any such bill general, would it not?

A. Yes, sir.

Q. And to give authority to depot companies, or other railroad companies, to lay out their routes or depot grounds upon the property of other companies?

A. Yes, sir.

Q. So that it would put every depot ground and the railroad property of every company at the mercy of a competing company

and the whims of the locality?

A. No such law as that would ever be passed; but, I think, this might be done: No such thing would be ever likely to arise in a city like ours, but there might be a set of circumstances where one railroad company might be a great deal more important than another, and where one company, although they were actually using the yard, had more than they actually needed, or they might acquire property on the other side; in passing a law the legislature might provide that where such exigencies as that arose, and it was absolutely necessary for one company to take a part of the depot of another company, they might provide a tribunal which should determine what the public necessity there required, and if the public necessity did require such a thing, and they provided such a tribunal to ascertain it, possibly that thing might be done, but that could only be done by an act authorized and framed with great care and on purpose to accomplish that thing.

Q. That would have to be a general law?

A. Yes, sir.

Q. And the limitations upon the power given would have to be such as to be expressly such a case?

A. They would.

1079 Q. And it is possible that a general law, framed in that way, could be passed in a special case, where the public necessity was very great?

A. It is possible.

Q. Do you think that the union depot company, with the aid of Mr. Dickinson, or anybody else, could have got an act passed through the last or any previous legislature that would authorize you to build an elevated road over the Michigan Central property?

A. No, sir; it never could have been done.

Q. At any rate it has not been done?

A. A railroad company must have entire command of its yards, according to the exigencies of its business; it has to shape and

reshape its tracks; the Michigan Central has been relaid with tracks, I think, 20 times since it existed, and every new accession of business requires a change of tracks in the yard, and the posts in the yard, upon which an elevated road would stand, would be immensely in the way; we had the utmost difficulty in getting across the Michigan Central railway, with the few tracks they have in the street there; in the yard there it would be an intolerable nuisance.

Q. Is it not a fact that where you cross on the triangular space down there you actually destroy track-room enough for two cars to

stand on?

A. Yes, sir.
Q. They assented to that, and so no question arose as to that?

A. Yes, sir.

Recross by Mr. DICKINSON:

Q. You had no difficulty in the last session in getting an almost unanimous vote authorizing the city of Detroit to close two streets for the union depot company?

A. I had a good deal of it.

Q. It passed by a unanimous vote?

A. No, sir.

Q. Have you had any difficulty in getting any legislation you

wanted for the union depot company?

A. Considerable. There was one bill passed by a unanimous vote, and I will tell you what it was: We had so much obstruction put in the way of this depot company by the Michigan Central Company, a long controversy with them, so much so that the time was likely to expire within which we were limited to complete this work; we were required to finish this work within two years.

Mr. BAKER: To have it done the first of August of this year?

A. I think it was some time in August. It had got to such a pass, by the delays, that I was afraid we would not get through by that time. I got some member of the legislature to introduce a bill to have the time within which this work should be done extended one year. That passed unanimously. The other did not, because a great deal of opposition comes from private parties who are injured, who want to be paid before it is done.

Q. That would have passed unanimously if it had not been for a

man on Baker street, who had a pull on one of the senators?

A. That would have passed undoubtedly.

Mr. Dickinson: Do you know how many square feet the Michigan Central recently acquired on this 160-feet front running through to the river; how large a territory?

A. I don't understand that.

Q. You don't know that the Michigan Central have within six months purchased of the Detroit, Lansing & Northern, one of the concerns that are going in your depot company, 160 feet front on River street, running through to the river?

A. Yes, sir.

Q. Do you know how many square feet there are in that lot?

A. The lot I think is 50 feet wide on River street, running through the same width to the river, and also ten feet more, but the ten feet is subject to the city, to have a sewer cross it; there are 60 feet therefore, but ten feet subject to the right of the city to build a sewer in it.

Q. Where did they get the 100 feet? There is 160 feet altogether. They did get 160 feet wide there; can you tell me how far they are

from River street to the river?

A. Somewheres about 300 feet I think. There is another piece of property there which was acquired by the Lansing Company, and it was acquired when I was president of the Michigan Central road; the Michigan Central road, as I construed the charter at that time, had acquired all the property by condemnation which it had the right to acquire, because it is limited by its charter to a certain width on each side of its road; but the Lansing road was there. running there, and I got an act of the legislature passed and I guess it is merged in these general laws, which authorized any one of two companies who were occupying the same ground to acquire by condemnation any land which might be for the interest of both to acquire, and I condemned that under the Lansing charter, and the Lansing acquired it by condemnation. That property also was sold to the Michigan Central when it was compelled to leave the

Michigan Central, because they cannot do business there.

Q. But it has not left there yet? 1082

A. But they have been notified time and time again that they must go.

Adjourned to Tuesday, July 7, 1891, 2 p. m.

Tuesday, July 7, 1891-2 p. m.

GEORGE V. N. LOTHROP, sworn for respondents.

Examined by Mr. BAKER:

Q. How long has the city of Detroit been your home?
A. Very nearly fifty years.

Q. How long have you practiced your profession, or at what time did you commence the practice of law?

A. In the spring of 1844.

Q. In this city? A. In this city.

Q. And you remained in active practice until what year?

A. Until 1885.

- Q. Were you at any time the counsel of the Detroit, Lansing & Northern railroad?
 - A. I was.

Q. Were you the counsel of other railroad corporations?

A. I was the general counsel for the Michigan Central for a good many years, from 1854 or 1855, and I think I resigned about 1880. but I do not remember the year exactly.

Q. Were you the counsel of the Detroit, Lansing & Northern

when Mr. Mulliken was the general manager?

A. I was. I should say that I was the general counsel of the Lansing road for a considerable number while I was also counsel of the Michigan Central, and I remained counsel for the Detroit, Lansing & Northern after I resigned as counsel for the Michigan Central.

Q. Do you remember, at one time, while you were counsel of the Detroit, Lansing & Northern, that the Michigan Central gave that

company notice to vacate the Michigan Central grounds?

A. I remember it very distinctly.

Q. Do you remember the grounds on which the Michigan Central claimed that the Detroit, Lansing & Northern should vacate those grounds?

A. Yes, sir.

Q. What was the reason given?

A. The reason given was that their own business had increased so largely that they required all of the room for depot uses at Detroit, and could no longer accommodate the Detroit, Lansing & Northern. The contract was about to expire. There was a written contract by which the Detroit, Lansing & Northern had depot privileges at the Michigan Central that was about to expire, and this notice was given some time before it was to expire, that they could no longer continue.

Q. Where did the Detroit, Lansing & Northern road terminate

at that time its own tracks?

A. Its own road terminated at what is now called West Detroit. It used to be called the junction of Springwells. They came in just west of the passenger station there.

Q. And ran in over the tracks of the Michigan Central?

A. Yes, they came in over the tracks of the Michigan Central.
Q. In connection with that notice that was given by the Michi-

gan Central, were you consulted by Mr. Mulliken or the other officers of the Detroit, Lansing & Northern as to what could be done in the direction of condemning a right of way over the Michigan Central tracks into the Michigan Central grounds?

A. I never had any such consultation with anybody.

Q. Do you remember of giving Mr. Mulliken any advice as to

what the law was upon that subject?

A. I have no distinct recollection of any conversation with him upon the law upon that subject. I would state in that connection, if it shall not be objectionable: under the condition in which the Detroit, Lansing & Northern was placed by that notice, it became necessary to consider what should be done about it, and what condition it would leave the Detroit, Lansing & Northern in, if the Central road should succeed in excluding them from their depot. Conversations upon that subject I remember to have often had with Mr. Mulliken, and with no other officer of the road.

Q. Will you state what advice you gave at that time as to the

3481

power of the Detroit, Lansing & Northern, under then existing statutes, to condemn a portion of the Michigan Central property?

A. As I have no recollection of the question ever having arisen, of course I have no recollection of ever having given any advice to anybody on the subject.

Q. Did you investigate the question at that time?

A. I did not, specially.

Q. Were you familiar with the law upon the subject at that time?

A. In a general way I had to know something of the railroad

law.

Q. You have been familiar with the railroad statutes of this State for a good many years?

A. It had been my business to be, and I was somewhat so.

1085 Q. Will you state whether or not, under the statutes as they existed at that time, the Detroit, Lausing & Northern road, which was a road organized under the general railroad law, had any power to condemn the tracks or depot grounds of the Michigan Central?

Mr. Dickinson: To this we object as incompetent, and desire to note an exception.

A. The Detroit, Lansing & Northern was organized under the general railroad law, and I never supposed that they had any legal authority to condemn the depot grounds of any other railroad company whatever.

O. If there had been any such statute in Michigan, you would

undoubtedly - been familiar with it?

A. I could hardly answer that. That would go to the extent of my diligence and knowledge, and I would not wish to affirm that I did know it. I ought to have known it.

Q. Did you ever learn of the existence of any such statute or any

such authority in the law?

A. I knew that under special circumstances public franchises for one use might be condemned, under the authority of the legislature, for another use that was paramount. I knew that, and I have no doubt about it, but I did not know or believe that any authority had been given by the legislature to condemn the Michigan Central Railroad property, the depot grounds here.

Q. That was your understanding of the law?

A. Yes, sir; I supposed it did not exist.

Cross-examination by Mr. Dickinson:

Q. You were general counsel of the Detroit, Lausing & Northern while Mr. Mulliken was general manager?

A. Yes, sir.

1086 Q. Do you remember whether the question of the entrance of the Detroit, Lansing & Northern came up before or after the old depot company was projected?

A. I don't know that I know when the old depot company-

Q. I don't ask for the date; do you remember generally when the old depot company was projected?

Mr. BAKER: He was the counsel for it.

Q. Were you the counsel?

A. If you refer to the union depot company which came in in connection with the Wabash road, I was counsel for that company to this extent, that I assisted in the condemnation of a considerable portion of the land lying west of the depot grounds proper, for depot purposes, commencing with Mr. Backus' property and extending from that down to the old bay. The last piece of property, I think, was Sibley's, and beyond that one piece of property owned by Mr. Morton, I think.

Q. There was nothing in that depot company's affairs which

brought their interests above Twelfth street?

A. Not that I know of, and I had nothing to do with the portion of the property lying between Mr. Backus' premises and Twelfth street, which had been purchased by Mr. Joy by private negotiations, and some portions below Mr. Backus, had also been purchased. There remained, however, several pieces of property that had to be condemned, and in that I acted as counsel.

Q. Can you fix the event of the circumstance, not by dates, but whether the talk about the termination of the Detroit, Lansing & Northern contract with the Michigan Central was before or after

the depot affair?

A. Answering from impression, without being positive, my

impression is that the conversation was before that.

Q. You were counsel also, were you not, in connection with the union depot company, with reference to the bill that was introduced to form union depot companies?

A. Only to this extent, that I now remember on one occasion at Lansing, at Mr. Joy's request, I appeared before a committee, upon

some of the provisions of that bill, I think.

Q. Will you please state whether your present recollection is that your talk with Mr. Mulliken, and your familiarity with the laws which were then called to your attention in connection with this notice of the Michigan Central, was prior to or after the passage of that act?

A. My recollection is, as I said before, that my conversation was

prior to that.

Q. Your impressions of the law, which you have stated they were and must have been, prior to the passage of the union depot act, was that the franchise of one corporation could not be taken without statutory authority by another?

A. Yes, sir.

Q. There is no doubt about that at all; but you have no doubt that by express statutory authority the property of one corporation

may be taken by another?

A. I think I stated before that I always understood that all property was subject to the power of eminent domain, but that there must be, for the particular purpose of taking one piece that had

already been appropriated for that use, taking it for another use, there must be express statutory authority.

Q. In this State all legislation of this character must be general

in its nature under the constitution of 1851?

A. There are some provisions upon that subject.

Q. I am asking you as to your opinion of the constitutionality of this act, an act to enable the Detroit, Lansing & Northern to take depot grounds, or a portion of the depot grounds of the Grand Trunk road, you don't think such an act would be constitutional, do you?

A. I should think I should formerly have been of the impression that it would not have been. I would not dare to answer now.

Q. Suppose an act is passed authorizing one railroad company under certain conditions and limitations named in the statute to take the property of another railroad corporation, or its depot grounds, its right of way, do you think that statute would be constitutional?

A. I should hardly desire to answer the question; but I will ask another question, do you mean authorizing a particularly specified

corporation, and nobody else?

1088

Q. No, sir; authorizing railroad companies generally, under circumstances to be detailed in the general act, special circumstances which are to be passed upon by a tribunal, authorizing any railroad company, under such circumstances named in the act, to take a portion of the depot grounds, or a portion of the right of way of another railroad company?

A. I am not quite sure that I understand you, but if I do understand you, I should answer that I do not now see any objection, so that it will operate within the rule that would govern the taking of

private property for public purposes.

Q. You have answered the time when you had the conversation with Mr. Mulliken, and your familiarity with the statutory law, the union depot act, I should state to you, in order to refresh your memory, was passed in 1881, where you were advised,

and went before a committee as to some portions of it; it is now in the new compiled laws and was passed in 1881, in June; at the same session of the legislature, in 1881, there was passed this act:

"Section 3357. When any part of the land of any railroad company in this State, in or adjacent to its depot grounds, is not in actual use for depot or other purpose pertaining to the operation of a railroad, and such land is not needed by said railroad company for the purpose of a depot or other terminal facilities, it shall be lawful for any other railroad company organized as aforesaid, needing such land for the purpose of a depot or terminal facilities, to acquire the same in the same manner as may now be done for such purpose from individuals. The question of actual use and of necessity for the aforesaid purpose by said railroad company owning and not using such land, shall be determined, in addition to other questions, as provided by law in cases of condemnation of lands for the purpose aforesaid, and the same proceedings in all respects, as near as may

be, shall be had for the aforesaid purpose as now provided by law where land is acquired for such purpose from individuals."

At the time to which your attention has been directed, prior to the passage of the union depot act, do you recall that there was any such statute on the books?

A. I don't know of any such before that time.

Q. This is in the general railroad act, and is added to the general railroad act as section 3357. Under this section, to what tribunal do you understand the statute would refer the question of the actual use and the necessity for the aforesaid purpose by the railroad company owning such land, when it was sought to take it.

To what tribunal would the question go, under the provisions of that statute, to pass upon the question of the actual use of the land and the necessity for its use by the company

who owned it?

A. Before I should dare to answer a question of that kind I should give the matter of jurisdiction of the tribunal a very quite careful examination, which I never did.

Q. I will ask you the question, whether in the acquirement of land under the general railroad law the tribunal provided was commissioners to be appointed by the court, and at the election of

the private individual a jury?

A. Yes, sir, there was originally a provision in the constitution of 1851, which in certain cases was afterward modified, but so far as railways are concerned, I remember that commissioners were authorized, with the right, however, of private parties to demand a jury. The proceedings were to be conducted in some court of record in the State of Michigan.

Q. And at the election of the private individual, under the general railroad law, there should be a jury pass upon the question of necessity and the value of the property?

A. I don't remember any exception to that right.

Redirect examination by Mr. BAKER:

Q. This statute that Mr. Dickinson refers to authorizes the depot grounds, the property of another company, to be condemned, if it is not in use by that company and is not needed?

A. Yes, sir.

Q. Suppose it appeared, in a condemnation case that was instituted under this statute, that the property was in use and was needed, and there was no contradictory testimony, could a verdict in favor of the necessity and assessing the damages be sustained in

this State?

A. All these questions of law I shall have to answer with modesty, because I have been long out of practice, but so far as I remember, I never supposed that property that was in actual use and was needed for the use of one railroad corporation, could be condemned and taken by another. I should make perhaps one exception, and that is the crossing of railroads, for which special provision was made. Under that statute I never supposed it was

possible to take land already owned by a railroad company as its depot, and used for that purpose-

Mr. Dickinson: Was your attention ever called to that statute

before?

A. No, beyond this, that my attention was called at every session of the legislature to all this railroad legislation; beyond that I know of no special calling of my attention to it.

By Mr. BAKER:

Q. This statute was passed in 1881. For a number of years afterwards, until 1885, you were in active practice, and you conducted the condemnation proceedings for the old union depot company after that, did you not?

A. Yes, sir.

Q. And you were as familiar with the general railroad law and

the union depot laws of this State as any man in it?

A. I dare not say that I was acquainted. It was my business to know, and in a modest way I tried to know the railroad laws of this State.

Recross-examination:

Q. In your practice, under the union depot act, for condemnation of depot grounds for purposes of the old union depot, you had no question to come up as to the need of taking any property of another corporation?

1092 A. None whatever.

Q. So you had no occasion to examine the question, had

you?

- A. I have answered that the question of this particular statute and its construction never arose except so far as it would naturally arise to a lawyer reading the statute as passed by the legislature.
- Q. Of course the question of the actual use and need, under the question asked you by Mr. Baker, if there was evidence of the use and need by the railroad company whose property was sought to be acquired, that would be a use and need in good faith, would it not? There would not be any pretense about it?

A. Certainly not.

Q. And that would be a question of fact for the jury?

A. The same tribunal that passed upon the other.

Mr. Baker: Suppose the testimony was undisputed that it was in use, and there was no contradictory testimony, would it be possible under our laws for our courts to sustain a verdict in favor of the condemnation?

A. I should suppose not.

By Mr. CHAREST:

Q. By the fact that the Detroit, Lausing & Northern and the Flint & Pere Marquette are leaving the grounds of the Michigan

Central depot, without being sent away by the company, does not that show by that fact that they do not need all that ground?

A. I should not suppose that that inference could be drawn by

that fact alone.

Q. Would not that have to go to the jury as a point of law that in case they needed all the room, if they did need it in reality, they would tell the Detroit & Lansing and the Flint & Pere

Marquette to vacate the premises if they wanted, the fact that they do not do that, would not that convey the idea to the jury that there is ample room?

A. That might be a question for the jury to consider with the

rest of it.

By Mr. DICKINSON:

Q. The contract which was given to the Detroit, Lansing & Northern provided, did it not, that the Detroit, Lansing & Northern might have the use of these terminal facilities so long as it did not compete with the Michigan Central?

A. There was a provision in the contract by which competition with the Michigan Central at certain points was prohibited, and whether there were terms of forfeiture it would be impossible for me

to state certainly.

Q. The Detroit, Lausing & Northern was extended to Grand Rapids, and it did compete with the Michigan Central's Grand River Valley branch?

A. That whole work was done afterwards, and I know nothing

about that. I know nothing about that portion of the road.

ABSALOM BACKUS, recalled.

Cross-examination continued; examined by Mr. BAKER:

Q. Do you remember the meeting of the State railroad crossing board at the Russell house?

A. Yes, sir.

Q. Were you there?
A. Yes, sir.
Q. Was Luther Beecher there?

A. I think he was.

Q. You and Luther Beecher were both heard in opposition to the approval of the map and survey of the Fort Street Union Depot Company, were you not?

A. I think I spoke a few minutes.

Q. And so did Mr. Beecher?

A. Yes, sir.

Q. In the remarks that you made to the State railroad crossing board on that occasion, did you not insist that the proper route for the depot company to take was to go through the private property that is situated between River street and Fort street west, and did you not point out a route?

A. Yes, sir; in preference to going up the street,

Q. That went through the Backus property, between your mill and Fort street?

A. Yes, sir.

Q. Condemning a right of way through your lumber yard down there, the old union depot company, and the Detroit Western Transit and Junction Railroad Company condemned a right of way for the passage of trains only, did they not?

A. Yes, sir. Q. They had 50 feet right through your yard?

A. Yes, sir.

Q. Your yard was substantially as it now is? A. Yes, sir.

Q. It goes through there on a surface, substantially on the grade of the yard?

A. Yes, sir.

Q. In that proceeding you were awarded in the first place damages to the amount of \$35,000, were you not?

A. About that, I think.

1095 Q. And subsequently, after the road was built, the switches were so placed in the union depot yard and close to your property that they violated the limitation in the condemnation and switched across you for a number of years, did they not?

A. Trespassed on me.

Q. They did switching in violation of your rights?

A. Yes, sir.

Q. And you brought an action against the Wabash and the old depot company, and the Detroit & Western Transit, and finally recovered the sum of \$27,000?

A. Yes, sir. Q. You got a verdict of \$20,000 that was sustained by the supreme court, which covered a part of the time, and in settling the whole thing you received \$27,000?

A. Yes, sir.

Q. In that old condemnation case, where you received \$35,000, the only testimony as to the insurance rates was that furnished by Mr. Rothermal, was it not?

A. I cannot remember.

Q. But you remember he was called as a witness in your behalf?

A. You ought to remember.

Q. I am trying to see if you remember. Do you remember that he was at the head of the insurance bureau or the board of underwriters at that time?

A. I think he was.

Q. And fixed the rates for all the companies that were members, which included most all the companies?

A. Yes, sir.

- Q. And he testified, did he not, on that trial, that if the road was built through this lumber yard that it would necessitate an increase of the rates?
- 1096 A. I do not remember.

Q. Is not that in accordance with your recollection?

A. I cannot remember. I know the rate went up on us sate ward.

Q. Was not that in accordance with the testimony that had pr viously been given?

A. I don't remember, really.

Q. Don't you recollect that that was the fact, that he testified th the rates would be increased, and after the road was put throug he did increase them?

A. I know that it was divided up instead of being a blank policy.

Q. Don't you know that the rates were increased?

A. It made the rates more than double what we were paying for it before. I don't remember what testimony was on the subject.

Q. The second case involved the damage that was done to you lumber by soot and cinders?

A. Yes, sir.

Q. Commencing in the fall of 1882 down to 1887 or 1888?

Q. It covered a period of four or five years?

A. Yes, sir.

Q. You had, on an average, on that yard, during those year about 20,000,000 feet of lumber?

A. No. sir.

Q. How much? A. I can't tell you.

Q. Did you have 15,000,000 feet?

A. We had more than 15,000,000 a year, taking the whole year around.

1097 Q. How much would be in stock there as an average?

A. Ten or eleven million.

Q. When the jury went down to look at those premises a few days ago, perhaps I might say a week or so ago, didn't you employ a number of men and put on an extra force so as to have the whole mill in operation when the jury were there?

A. No, sir.

Q. Do you mean to say that nothing was done to show the opera tion of the mill that you took no precautions whatever to put that mill in shape for the jury when they would come there?

A. That is all foreign to my ideas. It is all new to me. I knew nothing of the kind. I knew we were in shape to run any part of

the mill if we wanted to.

Q. You had it all in operation when they were there?

A. Not all of it. Q. Nearly all?

A. Pretty nearly.

Q. Was it all in operation the day before? A. We are capable of doing it at any time.

Q. Was it in operation the day before the same as it was the day we were there, the same machines and the same men?

A. They might have started up a machine that would have been

standing idle if these people had not been there. We can show off any day just as we did that day.

Q. You did show off that day?

A. I guess we did, the jury will know about that.

- Q. On the former trial of this case, the jury went down there to look at the property?

 A. Yes, sir.
- 1098 Q. You took some of the jurymen down there alone afterwards, didn't you?

A. No, sir.

Q. Were not some of them there?

A. Some were there, and I was told by one of them, "When we want any of your assistance, we will call upon you."

Q. Did not Francis H. Carr, one of the jurymen, go down there

and go through that mill alone?

A. Not to my knowledge. Q. Did you see him there?

A. No, sir.

Q. Did you see any of the jurymen there?

A. No, sir.

Q. Do you know anything about any of the jurymen being there

after the whole jury had been there?

- A. No, I should know better than to do that. That would not be equitable. It would not be in accord with the propriety of the thing. My common sense would tell me not to interfere with any man.
 - Q. Do you know whether any of them were down there alone?
 A. I do not. I never saw them. I never heard of their being

there.
Q. Mr. Carr is an old friend of yours, is he not?

Mr. DICKINSON: I submit to the jury whether you will permit us to drag in the names of the jurors on the former trial. I insist upon this objection and I ask the jury to take a vote on it.

Mr. CHAREST: We want to do with this trial and not with the other, for my part, providing none of this jury has been to visit Mr.

Backus' mill.

1099 The FOREMAN: The jury seem to agree that the former trial should have nothing to do with this.

Redirect examination:

Q. Will you please state whether, when this jury took a view of your property, you gave any directions to prepare the works to make a good show to the jury?

A. Never, neither this jury nor the other.

Q. I am not going into the other jury at all. Did you direct a thing to be done that would not be done ordinarily as it goes?

A. Nothing whatever.

Q. Will you please state whether the jury saw your works in your ordinary operation on that day, and if there was any exception name what it was?

A. I thought it was as we were doing it all the time, whenever we had business. Sometimes business was slack and we let this machine stand idle, but it was managed so that we could start that machine up. We could always do that.

Q. Was that machine going the next day after the jury were there?

A. Yes, sir.

Q. But you did not give any directions to start up that machine particularly?

A. We did not have any extra men. They were the same men

that work it all the time.

Q. How many men do you have on your pay-roll?

A. I think about 130.

Mr. LESHER: I would like to know whether you had any more men on your pay-roll that day than you had the previous day?

1100 A. No, we made no change. The men that were there, if we wanted to take a man and put him over on that machine, it was done. Of course the men always had pride in showing off. I presume likely they might have been running two machines when they could have got along with but one. We showed it off just as we could do it every day.

Q. You were asked by Mr. Baker to bring some letters that you had received in regard to the dust-room and this apparatus?

A. Yes, sir.

Q. Will you produce the letters or some that you have?

A. I can if necessary. Q. Are they all here?

A. No.

Q. Here are some that you could gather up?

A. Yes, sir.

Mr. Dickinson offered and read in evidence certain letters marked Exhibits 1 X to 9 X, inclusive; also printed pamphlet containing testimonials.

Q. Has the Cyclone and other dust-arresters an opening at the top to the outer air?

A. As a rule, I think that is the way they are arranged, so as to let the air out from the top while the fuel goes to the bottom.

Q. There are none that do not have an opening at the top through which dust may sift?

A. I think not; I never saw them.

Q. On this matter of dust-arresters, you think you have the best; will you tell the jury, in your judgment, whether you think you

have the best for your business?

A. Where I draw the line is the absolute perfection of the thing. There is no back pressure in mine; that puts it within the reach of any man. I mean when you are blowing this fan we are carrying the wind through a pipe. If you take a board and hold over the end of the pipe, your machine would go out, would not do any work, so it is found that it requires about 15 horse-

power to run a centrifugal or Cyclone machine. We have a great many instances. I have been told a great many times, in one particular case where a man said he used 60 horse-power more than he did before. The Croghan Street people have two, and they say they use 30 horse-power. Mr. Ferry's people told me it required 15 horse-power for each machine.

Q. Does yours do your work to your entire satisfaction?

A. Yes, sir.

Q. With the other machines it takes 15 horse-power to each fan?

A. Yes, sir. Q. How many fans do you have?

A. Three.

Q. So that as a matter of economy this is the best?

A. Yes, sir. My fans are unusually large; larger than most fans You noticed one of them is 22 inches across. It would probably take 20 horse-power.

Q. I have not the slightest idea that the union depot company has any right to change your judgment on the dust-arrester?

A. Take that sawdust-room—there is a room 60 feet long, 30 feet wide and 26 feet high; a pipe comes in at one place; it will fill that place full of sawdust, and yet when it comes out at the top, this Cyclone would drop it down in the shape of a cone at the sides,

and around it would be empty, so that the shavings would The result would be that I would not get over 1102 bank up.

half the capacity in my storage-room that I now have. That is a very important matter, the matter of room. I have a room probably 65 or 70 feet long for my shavings, and one fan takes it in at one side and they take it out the other, and I fill that place full, and when it gets full I draw out a slide, but with the Cyclone we would have to take it up to the top and drop it down, and that is the end of it; there is no power to carry it in.

Q. You would not put in another dust-arrester than your own?

A. I would not if I were building 40.

Q. You think your judgment is just as good as that of the union

depot company, as to what you want in your own business?

A. Yes, sir; mine does the work perfectly, and does it without any expense, and I can use all of my room for shavings or for sawdust, and I have got my power for something else, and I have got it all built and I do not propose to rebuild it. It would not be policy for me to go on and build another mill.

Q. Do you at times use your full power in your mill?

A. Most always.

Q. And you have accommodated all your works to the buildingyou have cut your garment to suit your cloth?

A. Yes, sir.

Q. Does all the lumber that comes to your mill-is it all dressed on the first floor?

A. All that comes into the lower floor is dressed.

Q. Everything comes into the first floor except that which is used for boxes, your local trade?

 Not all the lumber that comes into the lower floor is made into boxes.

1103 Q. All the lumber that comes into the upper floor is lumber that goes into boxes?

A. Yes, sir.

Q. And that lumber that goes into making box shooks that are shipped away comes into the first floor?

A. A good deal of it, that is resawed.

Q. How much of the lumber that comes in is used on the upper floor, the second story or the third?

A. The second floor, that is for box-work exclusively. I have been looking over and I find that about one-third of our entire busi-

ness is the box-work and the shook-work.

Q. For the rest of it, the arrangements of your mill and your machine arrangements are such that all other lumber comes in the first floor from the yard, and is dressed before it goes upstairs?

A. Yes, sir.

Q. Don't you think you could bring all that lumber in there on an elevated railroad and get it down to the lower floor, and send it upstairs; does it stand on your trucks as you work it up in the

lower floor?

A. No, it is dumped. We bring a particular kind of lumber, and it is put upon this machine that is doing a particular thing, and the other machine something else, and another machine something else, and we bring it usually in lots of about 2,500 or 3,000 feet, sometimes 5,000 feet, and dump it there, each grade and width. This is a peculiar business, and you will see before we get through that my business is not like other people's business, a peculiar business. A man wants a box and he wants it seven and one-fourth high, and we go to a pile of lumber that has been stored previously,

of ten inches, or eight inches, or seven and one-fourth inches, and bring a load of that length to this machine. It would be impossible to take it on a car and mix it in there. You could not do it for 50 cents a thousand. It would not be business.

It would make confusion.

Q. Did you hear Mr. Joy's testimony that there was no lumber or coal to go on the elevated road?

A. Yes, sir.

Q. Do you think it possible with these three tracks running by there on the elevated road, that they will give you switching accom-odations, using their track for half a mile?

A. I would not want it if they did.

Q. Did you ever hear of such a thing, doing this to accommodate you, permitting the road to be obstructed with your lumber?

A. No.

Q. What part of the lumber has to be weighed?

A. All of the stock that goes into shooks. We do not weigh the long lumber, because we can always estimate that. A thousand feet of lumber weighs 2,000 pounds; that is near enough for all practical purposes. All the shooks have to be weighed, so that

when we are putting 26,000 pounds in a car, we know just what

it is.

Q. Is it necessary to use the yard in front there, where these windows show through in the fence, when you are carrying on your business?

A. I don't know how we could work without it.

Q. Suppose you ever did need a switch from the elevated road—I cannot for the life of me see how you do, having all the accommodations you need from the Michigan Central—suppose they did put a switch in there, it would have to go on your front yard; it would have to stand on stanchions and posts?

1105 A. It would not be a practical thing.

Q. It would cut off some of your light, and keep your room so that you could not use it for any of the purposes for which you are now using it?

A. No, sir.

Q. You said last night your net returns were \$27,500; is that net over the \$5,000 a year rent?

A. I think it is.

Q. That is, it is not including the rent, \$5,000 a year?

A. Yes, sir.

Q. How long have you been receiving this \$5,000 a year rent from this business, from the company?

A. I can't tell you.
Q. Five or six years?

A. Yes, sir.

Q. Got it always?

A. Ever since we built that mill.

Q. You built up this business; you carried it through the panic of 1873, and the depreciation following it; you gathered together this large lumber yard, and this mill, and the property on Fort street?

A. Yes, sir.

Q. And after getting the property in shape, so that it would run, you formed the corporation, by which it should pay you \$5,000 a year rent, and then put your boys in the corporation with you?

A. Yes, sir.

Q. Did you bring up the boys to this business?

A. Yes, sir.

Q. Educated to this business and no other?

A. Yes, sir.

Q. Always been in it and worked by your side?

1106 A. Yes, sir.

Q. You receive the \$5,000 a year rent and your share as a corporator beside?

A. Yes, sir.

Q. Mr. Baker made you say, and I notice he has great success in getting you to say things, when he asks you the questions so loud as he does—Mr. Baker made you say you did not make any money from 1882 down; how much was your loss on the fire in 1882?

A. If I remember, it was about \$145,000.

Q. Your total insurance that you carried was how much?

A. \$38,000.

Q. So that your total loss by the fire was \$105,000?

A. Yes, sir.

Q. During the years following 1882, you told Mr. Baker you had made no money; do you mean by that that you did not divide dividends?

A. That is what I mean.

Q. But you went on and paid this debt right along?

- A. Yes, sir; I paid the \$105,000 in those years, and a good deal more.
- Q. When you told Mr. Baker you made no money for those years after that building was built, you meant you did not declare a dividend, because you were paying the losses?

A. Paying up these debts.

Q. You rebuilt your mill at a cost of how much?

A. \$116,000.

Q. You say it cost you to rebuild it \$116,000; were your dry kilns burned?

A. No.

Q. What were they worth?

A. \$10,000.

1107 Q. Was your office burned?

A. No.

Q. What did that cost?

A. \$15,000, office and furniture.

Q. Anything else that you did not have to rebuild?

A. The water pipe to the river.
Q. What did it cost to put that in?

A. \$3,000, and I think the boilers were not damaged much.

Q. How about the stone walls?

A. We made no account of that,

Q. You used the old building to build the sewers?

A. No, I used the old building to build the walls.

Q. You used all that was not destroyed, and it cost you \$116,000 new money?

A. Yes, sir.

Q. And you used all the old material and brick that you could?

A. Yes, sir, and I worked for nothing.

Q. You haven't charged anything for yourself and boys?

A. No, sir, and it cannot be duplicated for a dollar less than we did it.

Q. Mr. Baker, with marked impropriety, if he will permit me to say so, has asked you about the other suits, the condemnation of the right of way through your lumber yard, for which you got \$35,000, and then the suit that you brought for damages for switching around on your yard?

A. Yes, sir.

Q. That looks like a pretty good lot of money. Mr. Baker was your counsel in both of those cases against these people?

A. Yes, sir.

Q. How much did you have left of your \$35,000 of the 1108 amount realized out of that suit after payment of your extra rates of insurance?

A. I could not tell you.

Q. What is your idea about that?

A. We had to pay equivalent to about three per cent.; it was brought out the other day.

Q. How much did you carry on your lumber yard?

A. If I remember right, we had \$250,000.

Q. What was your old rate?

A. One and one-half.

Q. It was increased to three?

A. It was made three.

Q. So that that rate was increased 11 per cent. per annum?

Q. On an insurance of \$250,000?

A. We did not carry so much all the time.

Q. What was the average amount you carried?

- A. I could not tell you. It cost us more than double the insurance we paid before. This \$27,000 Mr. Baker has referred to that was collected-that did not go into this account at all. That never had any part or parcel with our business. After we got through paying our counsel, Mr. Baker, what there was left went to the credit of profit and loss. It did not go into the calculation of our business.
- Q. You say the money received from the railroads is not included in the statement of the profit of your business?

A. No.

Q. Did not go into the books?

A. It was all kept separate.

Q. You have been asked about your verdict in these cases; 1109 did you get full compensation for the damage to that business?

A. They paid us \$27,000. If they had paid us \$100,000, they could not have made us whole for what we lost. Our business was driven away from us, destroyed. Under our protest, our remonstrance, time after time. I endured it for four years and then I commenced that suit.

Q. You mean by these switches and so forth by your place.

A. Yes, sir, it drove my trade away and destroyed it as a lumber institution.

Q. The business at the lumber yard?

A. Yes, sir.

Q. It detained your teams when they were switching there?

A. To say nothing about that.

Q. In addition to your increased insurance, did the insurance companies or the underwriters require you to keep a watchman in addition?

A. Yes, sir.

Q. Which you did not do before?

A. We have always kept a watchman since the time the road went through.

Q. How much area do your lumber piles occupy on the seven

acres?

A. Something over seven acres.

Q. You receive the most of your lumber by boat?

A. Yes, sir.

Q. You do not, like Dwight out here, receive it by rail? A. No.

Q. You do not need any tramways to run it down to take it off in the piles?

A. No, sir. 1110

Q. He keeps a local lumber yard as well as selling to lumber dealers?

A. He wholesales also. Mr. Dwight I don't think makes a suc-

cess the way he handles it; I don't think it will be possible.

Q. When he wants to send a load of lumber in the city does he send it out on a tram and ship it onto a railroad, and run it on the railroad in the city?

A. He has to put it on the tram car and shove it out where he

can get his team.

Q. What is the object of that?

A. To save him teaming work, I suppose.

Q. He he not load it onto a car?

A. No, sir, he loads it on a small car and shoves it out where he can load it on a wagon. There are two tracks that run along where he can load lumber on the car if the car he wants to load it on stands right there, otherwise he would have to move it.

Q. He receives all his lumber by rail?

A. Yes, sir.

Q. What is the difference in the cost, per thousand, receiving by

boat and by rail?

A. I could not tell you. I have been advised that he pays two dollars a car to haul the lumber up from the dock to his place.

Recross-examination by Mr. BAKER:

Q. You have two switches that connect with the Michigan Central?

A. Three.

- Q. Do you have any difficulty in getting them to do your switching?
- 1111 A. Not much; they are pretty generally ready and willing to help us; they always cater to us when they can.

Q. And they take it out on their main line?

A. Not on their main line.

Q. On the tracks that go out to West Detroit?

A. Yes, sir.

- Q. They take it right out to West Detroit whenever you want it done?
 - A. They handle them on certain tracks.

Q. They take them out in some way to West Detroit whenever you want it?

A. I think they take our cars whenever we want them to go.

Q. What do they charge you to take it to West Detroit?

A. I can't tell you.

Q. You don't mean to testify in your judgment that the union depot company, if they had a switch connecting your yard with your mill, would not do your switching promptly and efficiently, the same as the Michigan Central does?

A. I want it understood distinctly that it is an utter impossibil-

ity.

Q. I am not asking you that question; that is the ground you put it on, and your counsel had you testify that you did not think the union depot company would do your switching even if you had a side track; you do not mean that?

A. No, I think they would do it.

Q. As far as the Wabash is concerned, they do it just as promptly?

A. Undoubtedly.

Q. And if it was put in, as far as they are concerned, they would serve you undoubtedly?

1112 A. I suppose they would.

Q. If it was put in so that it could be operated, you would not have any question about having the service performed?

A. I would not have it up there. Q. That is another question.

A. If I wanted a car switched by the Wabash, I have no doubt they would do it as promptly as the Michigan Central.

Q. You do not mean to change your testimony, that you did not do a successful business from 1884 to 1888?

A. I did not wish you to take my testimony in that way.

- Q. You testified that you did not make any money in those years?
- A. I testified in that way, but I wish to correct it so that it will read that we made no dividends.

Q. You did not have anything to divide?

A. No, I kept applying it to pay our debts, paying up the building of the mill that was burned.

Q. Did you get your debts all paid?

A. Yes, sir.

Mr. TRAUB: Was there a decline in lumber in those years?

A. Lumber has held about the same price all along.

- Q. Is it not true that lumber is going up a little all the time?
- A. We used to sell lumber at \$60 that we are now selling at \$50.

Q. Certain kinds?

- A. The better grades of lumber are lower today than ten years
- 1113 Q. I suppose there is more of it; when you got \$60 it was inflation prices, in 1872 and '73, before the panic?
 - A. I suppose it was, when everything was booming. Q. As a matter of fact, lumber is becoming scarcer?
 - A. We can buy it today cheaper than we could two years ago.

Q. You say that office down there and furniture in it co \$15,000?

A. That is what we expended in putting it in shape.

Q. Where did you put that money in that office; is it in the furniture, or in the walls, or where is it?

A. It is in the decoration. Q. And sideboard there?

A. No, there are marble mantels.

Q. Could you not duplicate that office for a good deal less that \$15,000 today?

A. No.

Q. How much did the walls cost? A. It was all done on contract. Q. Who was the contractor?

A. Moross, I think.

Q. Did you let it on advertised bids?

A. I think we did.

Q. What was the contract price?

A. I could not tell you. Q. Was it \$15,000? A. No.

Q. Who did the decorating?

A. Penfield.

Q. In what year did you build that office? A. It must have been in 1879 or 1880.

Q. In the period of high prices?

1114 A. I don't know, not so high as they are now.

Q. Is it not your judgment that that office building coul be duplicated today for less than half of \$15,000?

A. You convey the idea that that office cost \$15,000; \$15,00 covers the whole thing pertaining to the office, decoration, marbl mantel-pieces and so forth.

Q. How big is that office?

A. 40 by 32.

Q. Where is the principal expense, where is this \$15,000 put, th bulk of it?

A. In the furniture and fixtures.

By Mr. FREUD:

Q. Don't you buy cheaper lumber of mills that are operated entirely by railroads, the logging done by rail, and also the ship ping done by rail, don't you buy cheaper lumber of those mills?"

A. No, they could not handle it in that way. Q. There is a mill that Stevens operates?

A. We could not buy lumber of Mr. Stevens; he retails his lum ber, he sells it the same as we sell it; he is a retailer, and we are retailers; we could not trade with him.

By Mr. BAKER:

Q. You could not do business with those people that manufacture lumber on the railroad?

A. Not so well.

Q. Won't the time come when you will have to use that entirely, when the lumber that can be brought by navigable water will be all used up?

A. It will not be in your day or in mine.

Q. Don't you know that the Alpena people have to go across to Canada now?

A. Certainly.

1115 Q. Don't you know that the money that has been made in pine lands has been made in lands that are in the interior

and have been made accessible by railroads?

- A. Yes, sir; railroads have developed the country; there is no question about that, but we can buy our lumber better where we can get it from parties that are large manufacturers; we buy a good deal of lumber in Lake Superior and Cheboygan and Alpena and Tawas and Oscoda and Saginaw and Bay City and Marquette; we could not buy it at the country mills because they do not make it in quantities sufficiently large; we want to get a million feet of one kind at a time.
 - Q. What proportion of your product goes away by water?

A. Not any of it.

Redirect examination by Mr. Dickinson:

Q. In speaking of the distance you gave yesterday, the nearest distance of the main line of the Michigan Central to your mill, you referred to the nearest distance from your corner of the mill; as the road runs toward the city, it continually runs away from your mill?

A. Yes, sir.

Q. Do you know the distance it is from your mill at this point; how many feet (pointing to map)?

A. No, sir; it must be two or three hundred feet.

Q. And the nearest point it comes is this main track here to the corner of your mill?

A. Yes, sir; the corner here to the main track is about 80 feet; I looked at it last night.

Q. To the main track?

A. Yes, sir.

Q. You are certain that the nearest point, even up on the corner, is 80 feet away; I want to get at the nearest point by

your own map; give us the scale and the distance?

A. That is off on a scoop, getting further over to the main track, 80 feet, right at that point. Then there is a track right around here, there is a branch track that comes off here for holding their cars; that is within about 20 feet.

Q. They run their cars in on that and stand them there?

A. Yes, sir.

Q. But I mean the main track, where the locomotives go up and down?

A. That is 80 feet.

Q. That is your nearest corner?

- A. Yes, sir; I looked at that particularly last night, so as to know.
 - Q. And, of course, it runs away further and further?

A. Yes, sir.

Q. The nearest point of the main track of the Michigan Central is as far away from your corner as the elevated road would be from your premises, if put over here on the Michigan Central?

A. Just about.

Q. I desire to ask you one other question. Do you think that you can maintain and carry on your planing-mill business there; on your judgment and on your oath, as a witness, and on your judgment as a business man, given under your oath, from your knowledge and experience of railroads, and the proximity of railroads and the way they are conducted, and you have seen them go to and fro there for a good many years, do you think you can carry on that planing-mill business, as you conduct it, successfully, with this elevated road there?

A. I don't think it would be possible for me or anybody 1117 else to do it, for the reason that my expenses will be very

much larger. The exposure there is what scares me away, the exposure to fire; then the annoyance of that smoke and cinders and smut on my lumber, and the obstruction to my light, makes so large a mountain to be lifted, that I have not the courage.

Q. I suppose competition is pretty sharp in your business in all

your trade throughout the Northwest and East?

A. Yes, sir; always.

Q. And your margin is so narrow that you have to do a large amount of business?

A. Yes, sir.

Q. You have to do things right?

A. Yes, sir.

Q. You have to have fine machinery and the work has to be done in a cleanly way, without any embarrassments, to keep you up with competing houses?

A. I cannot make any false motions.

Q. The competition is so great?

A. Yes, sir.

Q. Do you know whether you have in your business—and I suppose you are the one to know—any special machines of your own manufacture that you don't ordinarily show—special machines?

A. I know that we do our work in a superior manner to any of our competitors the land through. I know that people are very anxious to obtain evidence by which they could reach that; we have to keep people away.

Q. You have some special machines by which you think you do

your work better than anybody else?

A. We have a great many of them.
 Q. You have not done much else for about 30 years than build-

ing up this business?

A. We have always devoted ourselves to it.

Q. You have devoted yourself body and soul to that busi-

ness?

A. Yes, sir.

Q. I don't know whe her you go to church on Sundays, but I think I have seen you around your mill on Sunday; and your boys have been brought up to go in with you and to make this business a perfect success?

A. Yes, sir.

Q. You make some money out of it?

A. Yes, sir; it is a success.

Q. You have gathered this property that you have out of your business?

A. Yes, sir.

Q. What do you think all that machinery would be worth, if you were compelled to take down the mill and take it somewheres else?

A. I know you could not say it is half of its value; it wouldn't be possible.

Q. Could you use the brick over again in a building?

A. It would cost as much as new brick would.

Q. Cou'd you get such another location, with switch accommodations there, convenient to the rest of your plant?

A. It would be difficult; we are now located and we are now cen-

tral; it is a very desirable location.

Q. You do have a large local business that comes down there?
A. Local business all the time; we have a team delivering

usually 6 and 7 loads a day in the city.

Q. And do people come down there, drive down and give you

orders?

1119 A. Some of our customers come there, on Woodbridge street, to get their lumber.

Q. Do they come anywhere else in your mill than on Woodbridge

street to get their lumber?

A. Very seldom; our lumber is on Woodbridge street; they would not come on the Fort Street side because our lumber is not there.

NEWTON D. BACKUS, sworn in behalf of respondents.

Examined by Mr. Dickinson:

Q. What is your age?

A. Thirty-eight years next Friday. Q. What has been your business?

A. Lumber business.

Q. You have been with your father all your life?

A. Yes, sir.

Q. Worked up with him?
A. Yes, sir, since I was a boy.
Q. What are your duties?

A. Secretary and treasurer.

Q. Will you tell the jury, in gross, what was the increase of insurance per year which you were required to pay by the running of the road through the lumber yard?

A. The increase the first year after this road went through would

be at least \$2,500 for that year; the increase for the next year would be \$1,500, and the next year would be \$1,000, and since then it has not been less than \$1,000 since that road went through there.

Q. Over what it was before?

A. Yes, sir.

Q. Have you also carried an increased amount of insurance; do you include that? 1120

A. That would make the increased rate, I mean. Q. You are talking about the increased rate?

A. Yes, sir.

Mr. BAKER: He has given the total premiums.

Mr. Dickinson: At the same amount of insurance carried before?

A. Yes, sir.
Q. You have given it on the same amount as carried before?

A. Yes, sir; it varies different years.

Q. Are you also required to take an increased insurance?

A. Yes, sir, under the general average clause.

Q. I want to know the difference between the amount of insurance before the railroad went through there and what you were

required to carry after the railroad went through?

A. Where, for instance, a dollar-we will put it on the basis of a dollar-where we could carry a dollar on the yard before the railroad went through, it is divided into four sections now, and we are obliged to carry \$4 now.

Q. So that you carry four times as much?

A. Yes. sir.

Q. And the increased rates were double what they were on the old rate per thousand, or per dollar?

A. Yes, sir.

Q. Now, after this railroad went through in 1882-we will take it from 1882 -did it go through in 1882?

A. Yes, sir, the fall. Q. We will take it from 1882 to 1890, eight years. In round numbers, what has the increased rate been, and including in the total amount that you give the added insurance, the cost of the added insurance that you carried for eight years?

Mr. BAKER: He has given that.

Mr. Dickinson: No, he has not given that yet.

A. I would have to figure that up.

Mr. BAKER: Give us what it was before and what it is now, what

he paid in 1882 and what he paid in 1883, 1884 and 1885.

Mr. Dickinson: The total cost of your insurance; and I understand your previous testimony when you said the increase was 2,500 and 1,100-I got it from you more in conversation perhaps than in testimony-that that was merely the doubling of the rates at the old amount of insurance.

A. Yes, sir. Q. Now, add to that the increase of the actual insurance besides, and the cost of the added insurance that you are required to take

under the general-average clause by reason of the railroad going

through there?

A. Where \$25,000 would do us on the corner, if the railroad had not gone through there, now we are obliged to carry \$75,000 on the same insurance.

Q. What is the difference per year you pay?

A. It is three times as great.

Judge Chipman: It would be four times as large?

A. We carry three times the amount of insurance, and the pre-

mium is twice as large.

Q. Can you give us, by the railroad going through there, the amount in dollars and cents per year that that railroad going through there increased the cost of your insurance, and include in that, not only the increased rate, but include the cost of the added insurance that the general-average clause requires you to take?

1122 A. Divided into sections, and increasing the rate, it would

increase the rate nearly six per cent.

Q. More?

A. Yes, sir.

Q. That is six per cent. per thousand?

A. Six per cent. instead of one per cent.—where we used to pay one per cent., it costs now six per cent.; that is the difference.

Q. And the average amount of insurance carried per year, how

much is it now?

A. The last few years we have not had as much stock as we had ten years before. We have had during that time probably close on a million dollars of insurance on the place, during the whole period; that is, the yard alone, each year added together.

Q. Since 1882? A. Yes, sir.

Q. You have had, as a total, that insurance?

A. Nearly that; maybe I am a little high on it, perhaps it would be between \$800,000 and \$1,000,000. I could tell exactly by the books.

Q. Could you tell in round numbers the cost of the insurance?

A. I presume that insurance has cost us between \$20,000 and \$30,000; I cannot tell exactly, because I do not know exactly what I have paid. There has been a little variation in it, according to the variation of some of the companies, some of the companies charging more than others.

Foreman Lesher: How long for this amount?

A. Since the railroad went through there.

By Mr. Dickinson:

Q. Have you kept a watchman that was not required before?

A. We have kept a watchman in addition to that.

Q. As required by the underwriters?

A. Yes, sir.

1123

Q. What does he cost?

A. \$1.50 a night; that would be \$450 a year.

83 - 55

By JUROR:

Q. You always had a watchman before that, hadn't you?

A. No, sir; not previous to the railroad coming through there, because we didn't consider it at all necessary. The underwriters require a watchman there now.

By Mr. Dickinson:

Q. And about eight times \$400 would be the cost of the watchman?

A. The watchman would cost about \$4,000 in that time; it is nine years this fall since the road went through; eight and a half years now. Our insurance is a very large expense, so much so that father does not always know just what we have on.

Q. You attend to that yourself, in your part of the business?

A. Yes, sir.

Q. You have been the treasurer and secretary; will you please state what the cost of the new mill was, with the machinery, that is, of rebuilding?

A. The new mill cost \$115,937.69. Q. Exclusive of the old dry kilns?

A. Exclusive of the old dry kilns; I kept an accurate account of it, to know specially the amount of insurance to carry when it was rebuilt.

Q. What were the dry kilns valued at?
A. They cost us from \$10,000 to \$12,000.

Q. What else?

A. The office and the sheds and the water pipe and the stone walls that did not burn at the time of the fire?

Q. How much was all that that was saved and used and still remained as part of the plant; what was the cost of them in addition?

A. Probably between \$30,000 and \$40,000; when we rebuilt I kept the invoices of everything, brick and mason work and machinery and everything, divided into three columns; here was one for building, another column for machinery, and another column for engine and boiler; as we got bit by fire one time, we didn't want to get bit again; I wanted to know how much insurance to carry on the building, and how much for machinery, and how much for engine and boiler, and for that reason I divided it into three columns, and the total was \$115,937.69, and it has cost us more than that, because there was our own time.

Cross-examination by Mr. BAKER:

Q. How much did the firm pay out for insurance in the year 1881, on the lumber yard; what was the aggregate of the amount of premiums paid on the lumber yard?

A. In that year it was between \$2,500 and \$3,000; I don't know

exactly what it was.

Q. Have you not looked at your books to know just what the items are?

A. I have not looked at the books; I know what we carried and know what the rate was.

Q. But cannot you give us accurate information as to what you paid for insurance?

A. In the year 1881 it was probably \$2,500.

Q. But cannot you give us it exactly, to a cent, what you paid out for insurance that year?

Mr. Dickinson: He can in the morning, before we finish 1125 the case.

A. \$2,500 would be low.

By Mr. BAKER:

Q. But your cash account would show? A. The insurance account would show.

Q. You have an account there? A. Yes, sir.

Q. How many thousand dollars of insurance did you have that year?

A. We had \$250,000 that year.

Q. How much did you have in 1882?

A. We had \$150,000. Q. Not as much?

A. No, sir.

Q. What was the total premium?

A. The total premium in 1882, I cannot give you exactly, but probably \$3,000.

Q. What was the total premium you paid in 1883?

A. I presume \$2,000, on the dock for insurance, in 1883. Q. How much did you pay in 1884?

A. About the same amount.

Q. In 1885?

A. A little less.

O. 1886?

A. About the same amount as 1885.

Q. There were several years that ran along the same amount?

A. Yes, sir.

Q. Can you, from your books, give us the aggregate amounts of the policies and the total premiums paid from 1882?

1126 A. I cannot give you the aggregate of policies, but I can give you the premiums paid; I kept no record of the policies.

Q. Can you give us the total amount of premiums you paid from 1871 to 1891?

A. Yes, sir.

Q. Will you bring that up? A. Yes, sir; I can do it.

Q. Have you got that in a ledger account? A. I have got it in the insurance account.

Q. I would like a copy of your insurance account.

A. All right.

The examination of this witness is discontinued for the present, until he brings in the insurance accounts.

Documentary Proof.

Mr. Dickinson: I offer in evidence the report of the fire commission of the city of Detroit, the last report issued for the fiscal year ending June 30, 1890; the other is not yet printed. I also offer in evidence the official report of the fire department of New York for the three mouths and year ending December 31, 1888, at pages 50 and 51. I also offer in evidence the report of the fire commissioners of the city of Jackson for the years 1890 and 1891.

I will read from the report of the fire department of the city of

New York, at pages 50 and 51 of the report :

"March 1. Nos. 375 to 393 Lexington avenue, a six-story brick building, 200 by 195 feet, occupied as a furniture manufactory and for other manufacturing purposes, extending from Forty-

first to Forty-second street. The fire originated on the first floor, and extended to all parts of the building, entirely destroying it, and also to the buildings Nos. 148, 150 and 152 East Fortysecond street, each four-story brick, 25 x 50 feet, occupied as dwellings, which were all destroyed by falling walls. It also extended to the buildings Nos. 154, 156 and 158 East Forty-second street, each four-story brick, 25 x 50 feet, occupied as dwellings, slightly damaging them; also to Nos. 395 and 397 Lexington avenue, northeast corner of Forty-second street, a five-story brick, brownstone front building, 40 x 75 feet, occupied as a hotel, which was slightly damaged; also to the window frames and cornices of Nos. 139, 141 and 143 East Forty-second street, north side, each five-story brick, brownstone front buildings, 25 x 70 feet, occupied as dwellings, slightly damaging them; also to the window frames and cornices of Nos. 128, 130 and 132 East Forty-first street, south side, each fourstory brick buildings, 18 x 50 feet, occupied as dwellings, slightly damaging them. Large cinders from the fire fell on the roof of St. Agnes' Roman Catholic church, a two-story brick structure, 50 x 100 feet, situated on the north side of Forty-third street, near Lexington avenue, and were extinguished by a detail of firemen with slight damage. The intense heat also set fire to the sleepers and ties of that portion of the structure of the elevated railroad running on the south side of Forty-second street, from Third avenue to the Grand Central depot, and a section about 100 feet in length of the structure was destroyed by the falling walls. The first alarm was received at 12.261 p. m., from the special building signal box located in the building Nos. 375 to 393 Lexington avenue, and, on the arrival of

the first companies, the fire was burning so fiercely, that at 12.30 p. m. a second alarm was sent out. On the arrival of the first chief officer, at 12.31½ p. m., he immediately ordered

a third alarm, and at 12.42 p. m. the simultaneous call, 6-6-6-12-341-483, was sent, the exceedingly combustible nature of the contents of the building generating an intense heat and endangering the buildings opposite, on both Forty-first and Forty-second streets.

The services of 23 engines and seven hook-and-ladder companies were required to extinguish the fire, which was under control in two hours. The water supply was entirely inadequate. The fire was caused by sparks from a locomotive on the elevated railroad, and the estimated loss was \$361,000."

I read also from the 23d annual report of the city of Detroit, the

last one printed, at page 45:

"Causes of fires and alarms." I offer in evidence the whole page, but the largest number of fires were caused, outside cf locomotives, by "burning chimneys, 29; children playing with matches, 17; defective chimneys, 19; incendiary fires, 22; lamp upset, 13; lamp explosion, 13; overheating, 14; overflowing gasoline stove, 11; smoke from chimney and stove, 13; sparks from stove, 16; sparks from cigar or pipe, 31; sparks from chimney, 22; sparks from locomotive, 63; total fires and alarms, 517." Sixty-three from sparks from locomotives, you will find, is just 12 per cent. of all the fires in the city, and also the alarms, and how could there be an alarm without there was a fire from sparks?

Mr. Baker: The testimony was that those were mostly from

bridges.

Mr. Dickinson: Here is a memorandum obtained from John Kendall, from the fire office, from July 1st, 1890, to July 1st, 1891, as to fires caused by sparks from locomotives. I suppose it cannot be admitted without Mr. Baker consents.

Mr. BAKER: Bring Mr. Kendall here. Who is he?

Judge Chipman: Mr. John Kendall is one of the assistant chief engineers. I have known him for a great many years.

Mr. BAKER: I have no objection to your reading it.

Mr. Dickinson: I will read it. "Fires caused by sparks from locomotives from July 1, 1890, to July 1, 1891, 43. John Kendall."

The city of Jackson fire commissioners' report is not given in detail, as ours is. August 3d, Withington & Cooley, lumber yard, at 3.15 p. m., cause of fire, sparks from locomotive; miles traveled to reachit, 2 miles. There are some other details—estimated loss, \$1,500. These here don't state the cause of fires, only that lumber yards were on fire—oh, yes: July 31, alarm caused by lumber yards being on fire, owned by C. H. Plummer and J. C. Williamson, corner of Railroad street and Page avenue; put out with water; cause of fire, sparks from engine; \$75,000. Also, November 5th, wooden dwelling being on fire on corner of Detroit and Cooper streets; put out with chemicals; fire caused by sparks from engine; \$2,000. Also, December 9th, fire caught on roof of wooden building; cause, sparks from engine.

Mr. Baker: In this connection, I desire to read to the jury from these same books. Mr. Dickinson has introduced page 45 of the report of the fire commissioners of the city of Detroit for the year ending June 30,1890, and in the total number of fires, 517; total fires and alarms,

63 are given as from sparks from locomotives, and I desire to 1130 read the detailed statement showing what those fires caused by locomotives were. In January there were no fires by sparks from locomotives. This is for the year ending June 30, 1890.

In February there were none. In March there were none. In April, on April 24th, on the Fort Street railroad bridge, sparks from a locomotive : April 27th, there is a fire at Crystal and Trom. bley street, by sparks from a locomotive, that is presumably a building of some kind : April 29th, the Michigan Central Railroad junction, fire from locomotive; it does not state that it is sparks. That is all there was in April, and one of them was a railroad bridge, and the other was a fire from a locomotive, and it does not say it was sparks-probably emptying the ash-pan or something of that kind. Then in May: May 8th, Lafayette Avenue railroad bridge, loss, none; sparks from locomotive. The next is a very extraordinary cause for a fire, at 927 Twenty-fourth street, down there in that vicinity; cause of fire, sausages falling in the fire. Then May 11th, Twelfth Street railroad bridge, sparks from locomotive; then May 12th, Fifteenth Street railroad bridge, sparks from locomotive; 12th, D. & M. junction, loss \$60, insurance \$250, sparks from locomotive; that is the second one that appears to be some sort of building or something. In June there are none. In July: July 10, Lafayette Avenue railroad bridge, loss none, sparks from locomotive. July 30, Twelfth Street railroad bridge, loss none. sparks from locomotive. August: August 2, Twelfth Street railroad bridge, loss none, sparks from locomotive; same day, Baker Street railroad bridge, loss none, sparks from locomotive; same day, Lafavette Avenue railroad bridge, loss none, sparks from locomotive; August 3d, Lafavette Avenue railroad bridge, sparks from locomo-

tive : August 5th, Howard Street railroad bridge; sparks from locomotive; August 6th, Twelfth Street railroad bridge, sparks from locomotive; August 7th, Baker Street railroad bridge, sparks from locomotive; August 9th, Twelfth Street railroad bridge, sparks from locomotive; August 10th, Baker Street railroad bridge, sparks from locomotive; August 13th, Lafayette Avenue railroad bridge, sparks from locomotive; August 14th, Fifteenth Street railroad bridge, sparks from locomotive; 17th, Lafayette Avenue railroad bridge, sparks from locomotive; 18th, Lafavette Avenue railroad bridge, sparks from locomotive; 20th, Lafayette Avenue railroad bridge, sparks from locomotive: 20th, Howard Street railroad bridge, sparks from locomotive; 21st, Twelfth Street railroad bridge, sparks from locomotive; 21st, Baker Street railroad bridge, sparks from locomotive; 22d, Lafayette Avenue railroad bridge, sparks from locomotive; 23d, Lafayette Avenue railroad bridge, sparks from locomotive; 25th, Lafayette Avenue railroad bridge, sparks from locomotive: 26th, Lafayette Avenue railroad bridge, sparks from locomotive. In all these cases I have given you, the loss is stated as none. Also the following: August 28th, Lafayette Avenue bridge, sparks from locomotive; 28th, Twelfth Street railroad bridge, sparks from locomotive; August 29th, Fifteenth Street railroad bridge, sparks from locomotive; August 29th, Fifteenth Street railroad bridge, sparks fron locomotive; 30th, Lafay. ette Avenue railroad bridge, sparks from locomotive; 31st, Lafayette Avenue railroad bridge, sparks from locomotive; 31st, Fifteenth

Street railroad bridge, sparks from locomotive; 31st, Baker Street railroad bridge, sparks from locomotive.

September: September 2, Howard Street railroad bridge, sparks from locomotive; 3d, Lafayette Avenue railroad bridge, sparks

from locomotive; 3d, Howard Street railroad bridge, sparks from locomotive; 4th, Lafayette Avenue railroad bridge, sparks from locomotive; 4th, Lafayette Avenue railroad bridge, sparks from locomotive; 6th, Fifteenth Street railroad bridge, sparks from locomotive; 9th, Baker Street railroad bridge, sparks from locomotive; 12th, Lafayette Avenue railroad bridge, sparks from locomotive; 12th, Fifteenth Street railroad bridge, sparks from locomotive; 18th, Lafayette Avenue railroad bridge, sparks from locomotive; 19th, Baker Street bridge, sparks from locomotive; 21st, Baker Street bridge, sparks from locomotive; 24th, Lafayette Avenue railroad bridge, sparks from locomotive; 26th, Howard Street railroad bridge, sparks from locomotive; 27th, Fifteenth Street railroad bridge, sparks from locomotive; 27th, Fifteenth Street railroad bridge, sparks from locomotive; 27th, Lafayette Avenue railroad bridge, sparks from locomotive; 27th, Lafayette Avenue

October: October 3, Fifteenth Street railroad bridge, sparks from locomotive; 3d, Baker Street railroad bridge, sparks from locomotive; 3d, Fifteenth Street railroad crossing, they have got it—I guess that is the planking—3d, Lafayette Avenue railroad bridge, sparks from locomotive; 4th, Lafayette Avenue railroad bridge, sparks from locomotive; 9th, Lafayette Avenue railroad bridge, sparks from locomotive; 9th, Lafayette Avenue railroad bridge, sparks from

locomotive.

There is none in November, and there is none in December. Juror Traus: Were these bridges built by the city?

Mr. BAKER: They were built in part by the city and in part by

Mr. TRAUB: Are they insured?

Mr. Baker: In all these reports there is no statement that there was any loss in any case.

Another Juron: In case they are destroyed by a locomotive, are they replaced by the railroad company?

Mr. Baker: I do not know how that is. There was some arrangement between the Michigan Central and the city, by which those bridges are built.

Mr. Dickinson: The city does all the repairing. That is the

truth about it.

Mr. Baker: As I recollect it, there are only three instances in this entire list where there was a fire outside of a railroad bridge or a crossing that was occasioned by a locomotive, and those were at the junction and at out-of-the-way places.

A JUROR: Was there ever a fire that destroyed a bridge?

Mr. Baker: In this entire list it does not appear that there was a cent of loss.

Judge CHIPMAN: The Fort Street bridge has been so that the

engine had to go and put it out.

Mr. Baker: They ignite and burn, and they ring the alarm, and probably they go out before the engine gets there. It may be so

as to the Fort Street bridge, that the engine had to put it out, but it appears that these wooden structures are not above a foot or two feet above the smokestack, so that the sparks are sent with great force against the bridge.

Mr. Dickinson: Do you think that within two feet an engine

passing rapidly under would set it afire?

Mr. Baker: In a very dry time it would undoubtedly do so. Of course there is no disputing the facts. Now, as to this case in New York, there appears to have been a large fire on Lexington street, in a six-story building and adjacent property, and the fire

was caused by sparks from a locomotive on the elevated road, and the estimated loss was \$361,000. We do not know what the condition of the property was adjoining and what

occasioned it.

Mr. Dickinson: The fire started in a furniture factory, and that was what was destroyed. The other property was saved by the

fire department.

Mr. Baker: That is the only report you give here out of all the fires that occurred in the city of New York. As to the fire in Jackson, at 3.15 p. m., August 3d, Withington & Cooley's lumber yard, by locomotive sparks, that risk was \$3,000. It was in Withington & Cooley's lumber yard. There was \$3,000 risk, and the estimated loss was \$1,500; estimated insurance, \$2,000, insurance paid \$1,500; estimated number of feet of hose laid, 3,500 feet. That must have been away out, where they lay over half a mile of hose, nearly three-fifths of a mile of hose, and the distance the fire department traveled was two miles; a small lumber yard away out in the country somewheres. At any rate this evidence shows that the fire department traveled two miles, and that they laid 3,500 feet of hose.

Is that all your case, Mr. Dickinson?

Mr. Dickinson: I would like to know what testimony you will put in. There will be a few questions to Mr. Backus in the morning. What testimony will you put in?

Mr. BAKER: I am going to put in dust-arrester testimony, and I am going to put in testimony from New York, some additional

testimony; I cannot tell exactly what I will do.

Juror Charest: Suppose the jury deemed it necessary to go and look the ground over, can that be done after we are sent to our room?

Mr. Baker: Not after you are sent to your room, but before. If the jury want to take another view of the premises,
they can do so before they go to their room. All I object to
is men going down there alone. At any time after we get the testimony in or after the argument, before you go to your room, you
can go down there, but when you retire to your room there will be
no further opportunity for anything of that kind.

Mr. Dickinson: I give my friend notice now that I shall object to any testimony that was part of his main case. He put in his main case, and we have answered it with our proof, and we do not want a lot more of the same kind of testimony. If we do not have

any order, he would put in more; I could follow with a lot of other

testimony, and we never would get through.

Mr. Baker: I propose to contradict your witness Martine from New York, as to Pearl street and all that property down there, and the change of that rental and that whole subject.

Mr. DICKINSON: That is for the jury to say.

Mr. BAKER: It would be a pretty note if you could put in testi-

mony and we should not be allowed to contradict it.

Mr. Dickinson: You put in your testimony; there was the testimony of Mackintosh; and then we replied to that testimony; now if after looking the ground all over you put in a little more testimony, if after we put in the testimony of Martine, Mr. Baker seeks to back up Mackintosh's testimony as to the New York elevated system, and he is permitted to put in more testimony, I do not see any end to this.

Mr. Baker: Gentlemen of the jury, I think I know what rebuttal testimony is, and I propose to put in testimony that is strictly rebuttal. I do not care to open my case in chief. The things

that I will inquire about will be things that go to contradict the testimony on the part of respondents, and if at any time when I am putting that testimony in there is any possible question about it, I have no objection to a circuit judge being brought in here to make a ruling upon it. The question is not up

at the present time, at any rate.

Mr. Dickinson: The trouble is, gentlemen of the jury, about your summoning the judge. The supreme court has said that in ordinary cases a judge of probate may preside, who is not a lawyer, and you are the judges of the law under the constitution, and if you do submit to the direction of a judge, we have no remedy, whereas, if you commit error, we have a remedy; if you submit to the direction of a circuit judge, the supreme court has held that the erroneous direction by the judge, that would affect the verdict, we have no remedy against.

Mr. Baker: It is right the other way exactly. I have read the case. The statutes of this State provide that a judge can attend this jury for the purpose of instructing them. It has been decided by the supreme court that it is competent to do it. There are disputed questions of law before this jury, and I shall ask Judge Gartner, at the proper time, when we get the testimony in here, to come before

this jury and instruct them.

Mr. Dickinson: Why Judge Gartner?

Mr. BAKER: Simply because he is the judge that has charge of

the case by direction of the court.

Mr. Dickinson: By direction of the court the cases of railroad were referred to Judge Reilly, and I do not know why you should call in Judge Gartner. But, gentlemen of the jury, I shall read the

decision of the supreme court to you, that a lawyer or judge is not required to preside over you, that you are the judges of the law and of the fact, and that erroneous direction by a judge is not error because the jury are not obliged to take it.

A JUROR: I think, at the proper time it would be proper for you

84 - 55

to read it, and have your own argument as to the understanding of it, and I think then we shall be able to judge whether we want a

judge or not.

Mr. Dickinson: Mr. Baker is right when he says that the union depot statute provides that the jury may have a judge or circuit court commissioner, or some one to preside over their deliberations and advise as to questions of law, but the constitution provides, and that is higher than any statute, that you are to be the judges of the law and the fact, and the supreme court say distinctly that, notwithstanding such a statute, the jury are the judges of the law and the fact, and if there was an erroneous direction of a judge, we

would have no remedy.

Mr. Baker: Mr. Dickinson has made that statement repeatedly. I undertake to contradict him. I undertake to say to you, gentlemen of the jury, that when the constitution of this State provides that a jury may be had in these cases, it means no different than a jury in any other case; a jury in deciding a criminal case or a libel case, in deciding many cases, are the ultimate judges of the law and the fact, because they are to dispose of the whole case; but there is no decision yet that excludes from your deliberation the aid and assistance of a judge elected and appointed for that purpose. The statutes of this State provide for it. At the proper time we shall ask the circuit judge to instruct you as to the question of law that has been raised upon the other side, and I call your attention to it,

and the attention of my brethren on the other side, at this time, because we shall ask that it shall be done. We will

ask the learned judge to instruct you upon it, simply because we have no doubt that when these statutes are explained to him he will instruct you that we have no right to condemn any right of way along the margin of the Michigan Central Railroad property. My brother seems to realize the fact that if a judge comes in here and instructs you, that that will be the result, and for that reason he tries to keep from you the aid and assistance that a judge can Now, as far as any error is concerned, it has been settled that if a justice of the peace or any judge instructs a jury in a case where they are the ultimate judges of the law and of the fact, -if he instructs them correctly it is not error; if he instructs them erroneously it is error. We are endeavoring here to condemn this property for the Fort Street Union Depot Company; we desire to acquire title to the right of way to build that road in front of the property of Mr. Backus. If Judge Gartner or any other circuit judge should erroneously instruct you as to the law of this case, it would undoubtedly defeat our title, and it would be necessary to have another trial of this case; but knowing, as I think I do, what the law is, I desire to have Judge Gartner instruct you, and to have it go to the supreme court of this State to say whether his instructions are wrong or not. I am willing to put it in shape so that the circuit judge, subject to the review of the supreme court, may instruct you upon the question of law that my distinguished friends see fit to raise in this case. I have already presented to you the best possible evidence, the gentleman who was the leader of the

Michigan bar for at least 25 years, and he sustains every proposition that I have made in regard to the law of this case; there is no doubt about it. They have rested their case. Where is there a member of the bar in this city that has come here to 1139 testify that we have any such power? I have proven it by James F. Joy, a man who was in the active practice of law in this city for years, before he went to railroading, who was the legal adviser and the president of the Michigan Central railroad for years. He tells you he never heard of any such power or any such statute, for it does not exist. We do not want anything wrong or unjust here. We do not want to obtain anything of you by any trick. We do not desire to mislead you in any way, shape or manner. We simply say that the depot company could not go upon the property of the Michigan Central. We have proven it upon the stand by the best testimony that is obtainable in this city; it is uncontradicted and beyond question. We have four circuit judges that are here at your beck and call; I am willing to submit it to them; I am willing to submit it to any one learned in the law; and I do not propose to be hoodwinked out of it by any such arguments as are made here, that you should take the law entirely unto yourselves, and not consider any of this testimony or any of this proof. That is the position of this case. At the proper time we will present this whole subject, and hope to be able to present it to the learned judge who impaneled this jury; he can tell you the whys and the wherefores of it; and I have no doubt you will have confidence in his judgment and respect for it. If he makes a mistake, remember that it is an error, and not as Mr. Dickinson says,

this question of necessity, how could we review it and cor-1140 rect the wrong? That is the position he would like to have the case put in, and, if for no other reason, this jury ought to decide in favor of the necessity, so that we can take the judgment of the court and of the high tribunals of this State on this alleged question of law, because when you come right down to it, there is no foundation for his position; there is nothing to support it; it would be utterly impossible for him, or any other lawyer, to obtain a verdict that could be sustained in this or in any other court upon any such theory, and I am willing to submit this to the constituted authorities, to the judge that impaneled this jury; and I have no doubt as to the results, because I know that our position

that he is without remedy. Suppose, gentlemen of the jury, that you make a mistake against us and go out, and, upon this fallacious and erroneous view of the law, render a decision against us upon

is absolutely impregnable and beyond question.

Mr. Dickinson: Gentlemen of the jury, for the first time in a somewhat long professional career, although a young man, counsel have seen fit to call upon the witness-stand lawyers to testify what the law is. Nothing was ever heard of it the time before, and for the first time in a long professional career we have been charged, or I have been charged, with not doing my duty, because I would not do such an unprofessional thing as to call a lawyer to testify as to the law. Now, gentlemen of the jury, will sound make you believe or disbelieve the evidence of your own ars and the testimony of Mr. Lothrop? Did Mr. Lothrop tell you, or would he tell you, or could he be brought to tell you—counsel of the Detroit, Lansing & Northern, formerly counsel for the Michigan Central, a railroad lawyer from the crown of his head to the sole of his feet, could he be brought to tell you that you could not condemn that margin of the Michigan Central under that statute? Are you to be driven, not only to consider, but to take the statements of Mr. Baker

George V. N. Lothrop, who took that witness-stand, would never, I think, have stated, railroad lawyer as he is and counsel of railroad companies' interests as he is, he never would have stated to you that that strip of land could not be condemned for depot purposes and for these terminal facilities, and he did not so state to you, but he did state that that question under that statute that I read to him, and which was called to his attention for the first time, would go to the jury, and you are to be driven and bulldozed by a powerful pair of lungs to disbelieve what Mr. Lothrop told you upon that witness-stand not one hour ago.

Mr. Baker: Do you claim, Mr. Dickinson-

Mr. Dickinson: Oh, I know how much you earn; I know all about the treaty between the Michigan Central; I know why the hostility of the Michigan Central is withdrawn; I know you are compelled to go on and condemn the Michigan Central property; I know that hostility has ceased when the Michigan Central wanted Woodbridge street closed.

Mr. BAKER: Have you not been the counsel of the Michigan

Central?

Mr. Dickinson: Never in my life; I never took a railroad attorney fee but once; I never saw the color of the Michigan Central's money in my life, or any other corporation.

Mr. Baker: At one time before the State railroad crossing board, the attorneys of the Michigan Central asked for an adjournment on

account of your absence.

Mr. Dickinson: They may have wanted me; Mr. Pond told me he wanted me, and I told him I would not take a fee from a rail-road corporation.

1142 Mr. Baker: That is politics, I suppose.

Mr. Dickinson: That is not politics; that is good American citizenship; because the corporations put their hands upon the people's rights, and when any educated man, any man with knowledge of law, stands in their way, they retain him. You see the learned counsel here, for whose ability and knowledge of the law I entertain the most profound respect—no man shall go before me in respect for the hard-headed intellect of my learned friend here, or for his learning; he it was that fought the battle for Backus, won the battle for Backus when his property was liable to be destroyed, and when they found his mettle and ability they retained him, and Backus had to get somebody else. Now, gentlemen of the jury, I simply ask you, and here is the delicate point, it is the touch of the statute that Joy drew himself for this purpose, unless the Michigan

Central would yield something, it is the sensitive point, and every means has been strained to get you to evade the duty which under your oaths you are to perform; you are to be the judges of that question; I shall read to you the decision of the supreme court of the State, that in these proceedings a lawyer is not required to preside over your deliberations, for the reason that you are the judges of this question as American citizens; I shall read the decision that the direction of a judge, although it should be erroneous in an ordinary civil case, is not error, and they say it is not error, because the jury are the judges of the law and the fact, and the jury are not bound to take the direction of the judge; that is the reason I cannot complain of it or benefit myself from it. I do not dispute the proposition that you may invite in the circuit judge and take his opinion, and do as you like, but I won't ask you; you have had Mr. Joy,

a railroad man from a to izzard, a railroad man who thinks 1143 and sleeps on railroads-you have had his oath upon the stand that the law does not permit touching the Michigan Central property. For some reason Mr. Baker is very anxious to get Judge Gartner, to whom the case was not referred at the beginning of the term, but it was referred with miscellaneous business to Judge Reilly; I do not care what judge it is, but I put against the opinion of Mr. Joy, an interested witness, counsel here endeavoring to get this property, endeavoring to get this entrance cheaply, for no more roads than now enter Detroit, to wit, for the Detroit, Lansing & Northern, the Flint & Pere Marquette and the Wabash, the Canadian Pacific being the only new road here-I put against him the sober and mature judgment of that distinguished lawyer who sat in the chair with me as my associate, who gives you as his judgment that there is no question about their right to take that margin of the Michigan Central under the statute. Would you rather have the word of Judge Chipman, disinterested, except for his retainer in the case, with what you know of him, with his record as an upright and pure-minded judge, with his reputation for honesty in this community, with his reputation with wide learning in the law, with such a reputation that his fellow-citizens in Washington have in all great constitutional questions put him in the front as a foremost constitutional lawyer in the counsels of the nation? are the judges of the law and of the fact; you can take Judge Chipman's opinion, you can take your own, you can take mine, you can read the English language and you can take the statute; take Mr. Lothrop's testimony, that the actual use and need, claiming to want

the land when you seek to acquire it; take Mr. Lothrop's oath, or his statement of honor without oath, that the need and the use must be a need and a use in good faith, and that if the Michigan Central cannot make a showing to the satisfaction of a jury that they need that property and need it in good faith, and not merely to get all they can, a jury will say that they must give us this margin along that River street; save the property along the line of that road; let Backus go free without paying him a dollar, and go over

there and take this margin, just as they have taken property for the railroad crossing. Now I tell you, gentlemen of the jury, you a the keepers of the conscience in this matter, and you are the kee ers of your own consciences; no judge has power over you; and will be for you to decide, and I caution you that by no power bias, by no desperate effort to carry you away by mere force of wi power or by the efforts of a subsidized intelligence, you be drive from the performance of your duty, from assuming your respons bility as the judges of the law as you are. Take the advice of judge; remember, however, that you are not bound by it, that cannot be imposed upon you unless you want it; you can call i any judge you please of the circuit court, if you want it, but yo are not bound by his advice; if you consider yourselves bound by his advice and take his advice as the reason of your judgment, yo do an injury to your fellow-citizen who is entitled to your hone judgment on the question, because it is not error for the judge give you an erroneous direction, for the reason that the constit tion reposes in you the responsibility, with all it implies, to pa upon this question of law yourselves.

A JUROR: My view is that we ask the judge to decide th question, whether it would be his duty to give us a bindin

Mr. Dickinson: I will read you the decision of the suprem court hereafter.

Mr. Baker: At the proper time we will have the judge come i here and argue the whole thing over again.

Adjourned to Wednesday, July 8, 2 p. m.

WEDNESDAY, July 8, 1891-2 p. m.

NEWTON D. BACKUS, recalled.

Cross-examination by Mr. BAKER:

Q. Have you a copy of your insurance account?

Q. Does that copy show the ledger account just as it is?

A. Yes, sir; that is the total insurance for these years on ever

Q. The first paper you show me contains the aggregate amount

of the policies?

A. No, the aggregate amount of the premiums, \$53,699.67, for

Q. Does it show the amount of premiums paid each year? A. Yes, sir.

Q. Commencing with \$6,915 in 1883?

Q. Can you separate that and tell us how much was on the lun ber yard?

A. Yes, sir; I have it right here on this other paper; there is the

amount.

Q. That shows that in 1882 and 1883 you paid \$4,510?

1146

A. Yes, sir.Q. From 1883 to 1884 you paid \$3,300?

A. Yes, sir.

Q. From 1885 to 1886, \$2,840?

A. Yes, sir.

Q. From 1866 to 1887, \$910?

A. Yes, sir.

Q. From 1887 to 1888, \$900?

A. Yes, sir.

Q. From 1888 to 1889, \$500?

A. Yes, sir.

Q. From 1889 to 1890, \$900?

A. Yes, sir.

Q. Have you the amounts that you have paid prior to 1882?

A. I have the total insurance. Q. Haven't you got it by years?

A. Yes, sir.

Q. Is that shown on any other memorandum?

A. Yes, sir; that is from 1874 to 1881. I have not picked out the lumber.

Q. This is the total insurance?

A. Yes, sir.

Q. Can you pick out the lumber?

A. No, that is the total insurance that I took from the ledger for the eight years previous to 1881.

Q. 1874, 1875 and 1876, \$2,761 for the three years?

A. Yes, sir.

Q. 1877, \$3,399?

A. Yes, sir.

Q. 1878, \$1,200? A. Yes, sir.

Q. 1879, \$927? 1147

A. Yes, sir.

Q. 1880, \$1,245? A. Yes, sir.

Q. 1881, \$3,320?

A. Yes, sir.

Q. That was on everything?

A. Yes, sir; on the lumber at the dock and factory, and it also included cargo insurance.

Q. The first exhibit you showed me also shows the same kind of

insurance on everything?

A. Yes, sir; of course the warehouse does not amount to much.

Q. You can't tell us what you paid each year, prior to 1882, on the lumber yard?

A. It was very little, because we did not carry a great deal of insurance.

Q. There has been a good deal of difference in the amount carried since then?

A. It varies each year.

Q. Some years you have had but little, and other years a larg amount?

A. Yes, sir.

Q. That would depend on the amount of lumber you had in th

A. Yes, sir.

Q. If you had a large supply you insured it, if you hadn't yo

A. Yes, sir; although we always have to carry some ourselve anyway. Q. You always had some insurance and always had some lum

ber there? 1148 A. Yes, sir.

By Mr. DICKINSON:

Q. That is not the blanket policy; that is divided into four sec tions?

A. Yes, sir.

Q. Give us the four sections.

A. A, B, C, and D, divided up on the back of the form. On the face of it it reads, "It is understood that, in case of loss or damag by fire, this policy shall be liable only in proportion that tha amount, hereby insured, bears to the whole value of the entire property covered by this policy."

Q. The mill is insured, at present, for \$88,000?

A. Yes, sir; we always have a little more than father known about, but he does not ask us.

Q. The mill and the stock in the yard?A. Yes, sir.

Q. The moment the stock leaves the yard it ceases to be insured at the yard?
A. Yes, sir.

Q. And you use, per year, about 20 or 30 million feet?

A. Yes, sir.

By Mr. CHARKST:

- Q. When you insured your mill for \$88,000, did that represent the full value, or what surplus would you claim above the \$88,000 as the value of the mill?
- A. I can tell you. The \$88,000 is not on the mill, a certain amount is on the stock. It is divided up as follows: on the machines \$29,056; on the building, \$33,555.60; on the stock, \$18,821.20; on the engines and boilers, \$5,250.

Q. How much do you carry yourself on the mill and stock, and so forth, and on the boilers, how much do you expect to carry?

1149 A. We always expect to carry pretty nearly half of it our selves.

By Mr. DICKINSON:

Q. How much would you carry if the elevated road ran by it?

A. We would put on every dollar that the inventory showed.

Q. You would not want to take any chances?

A. No; we would not feel like it; we took those chances once and got left.

PHILLIP C. MILLER, sworn for petitioner.

Examined by Mr. BAKER:

Q. Where do you live?

A. Chicago.

Q. What is your business?

A. Putting in fanning and blowing pipes and dust-arresters in wood-work factories throughout thecountry.

Q. What firm or company do you work for? A. The United States Blowpipe Company.

Q. What does their business consist of?
A. Putting in dust-collectors and blowpipe faus, and so forth, for taking care of shavings and dust for furniture factories and all other wood-working establishments where any refuse is made.

Q. How long have you worked for that company?

A. A little over a year.

Q. What company did you work for before that, if any? A. For the Chicago Exhaust and Blowpipe Company.

Q. In the same business?

A. In the same business.

1150 Q. With the same plant or with another plant?

A. A different company, and they had a little different dust-arrester.

Q. How long did you work for that company?

A. About a year.

Q. What firm did you work for before that?

A. Part of that year I worked for the William & Curtis Manufacturing Company of Saginaw, which this Chicago company was finally consolidated with. Prior to that I worked for W. E. Kuche, of Chicago, formerly of Grand Rapids, in the blowpipe business, now retired.

Q. Did Kuche manufacture dust-arresters?

A. Yes, sir.

Q. What was your business before you worked for him?

A. I worked at my trade. Q. What was your trade? A. Tin and sheet-iron work.

Q. How long did you work for Kuche?

A. About three years. Q. What doing?

A. Putting in blowpiping, and the latter part of the three years canvassed for him, took orders and contracts and planned the work.

Q. What year was that that you were working at that business taking orders, if you can remember?

A. '87 and '88.

Q. Will you state what kind of a dust-arrester Kuche had?

Mr. Dickinson: To that question we object as immaterial.

85 - 55

Mr. Baker: This question is simply asked for the purpose of showing his experience and his knowledge of dust-arresters.

1151 Mr. Dickinson: So far as that is concerned, it is imma-

terial.

Mr. Baker: We desire to show that Mr. Backus has not a proper dust-arrester, and we can put in another kind that is fireproof, a great deal better, and do away with his alleged fire risk entirely.

Mr. Dickinson: To this testimony we object, and I desire to be

Mr. Baker: They have put in a great deal of testimony that might be objected to, but I have not objected to anything that they have put in on the other side.

Mr. Dickinson: We have not put in anything that went wide of

the case.

Mr. BAKER: You have put in a large amount of testimony that went wide of the case.

Mr. Dickinson: I suppose, notwithstanding your position in the matter, I apprehend the jury will hear me.

Mr. BAKER: Undoubtedly they will listen to you.

Mr. Dickinson: The question of what is a better dust-arrester is immaterial in this case, for the following reasons: We submit it to your candid judgment, and I make the objection here, because, whether you have observed it or not, during the putting in of the testimony of the other side, and during the cross-examination, they are going into matters that are taking the time of the jury and the counsel uselessly, and have no bearing whatever on the issue presented. We desire to raise the question upon this kind of testimony, and consider, if it is competent at all, they have not introduced it in their testimony-in-chief, and if it is competent at all, coming in now we shall be entitled to reply, and you will see where we shall

end, some time next Christmas, if we keep on doing that sort 1152 of thing. That is the reason why we present to you now the grounds which we, as counsel and as lawyers, deem it our duty to present to you in opposing the introduction of the testimony,

upon legal grounds.

The case is brought here, first, to determine the necessity of taking the street in front of Backus' property.

Mr. CHAREST: The right of way.

Mr. Dickinson: Covering the whole street from curb to curb, which is the property of Backus to the center of the street, subject to public easement. Secondly, if you pass that question that they may come up the center of the street, then to determine the value of the injury to Backus; that is all there is of it. No railroad company can come to your house or over your property and arrange for you a new set of dust-arresters or stove or furniture, or change your conditions. In other words, the constitution of your State, which is the fundamental law, provides that when a railroad company approaches a man's property, whatever it may be, approaches it in the interest of a private corporation, as a railroad company is, but vested, however, with certain rights for the public good, to get a right of way, when the man refuses permission and there is no

other way to go, under the constitution, the railroad company, if it touches you at all, must touch you as it finds you, and if it take your property and injures it must put you in the position of your neighbor in any remote part of the town, uninjured any more than your neighbor in a remote part of the town from the railroad company; in other words, if the railroad company puts the slightest detriment upon you by coming, it must make you whole. Now, the railroad company cannot come and fix up your premises. The premises satisfy you well enough. It cannot come and fix up

your premises with a new kind of safety stove, according to 1153 its own claims of what may be safer, or a new kind of safety. blind or a new kind of window, or a new kind of roof, and then ask the jury to assess damages as they would be if you were fixed up according to that style. It must take you as it finds you. Therefore, on that ground, we submit that this testimony is immaterial for you to consider, even if it were not absurd to introduce it. It is immaterial for you to consider, because Backus is to say what suits himself. His premises are to be taken as they are found, in accordance with the arrangements he has made for them, and you cannot take it on any scheme which the railroad company may attempt to have him adopt. He is not bound to do it. He is not bound to change his arrangements. He has, as he has told you, a dust-arrester that is perfectly satisfactory to him. He cannot be scared out as a citizen, even if you disagree with him, if it is satisfactory to him; and it satisfies him for one reason, that it is cheaper than any other one that can be put in.

Now, you are not required to go into the question, are you, as to whether some other arrangement might be fixed by which his appliance would be less dangerous if a railroad ran by him, provided he has not conducted his business so that it constitutes a public nuisance, or so that, by the ordinary uses to which the property is subjected, it would actually be in danger of fire, in the ordinary condition of things. You are to take the condition that he is in, and then taking the condition as it will be if the elevated structure be superadded. Look at the absurdity of it, on no other ground, and I state this briefly, I do not propose to take as much time to

argue this as it would take to put in the proof. You have 1154 heard one absurdity, in presenting to this jury immaterial testimony by our friend on the other side, in the matter of a new smoke-consumer, and the position of the counsel to convince you what would be out of 10,000 the best, and the witness swore there were 10,000, what was the best thing to prevent the rolling of cinders and smoke from a locomotive, and you will see what would be the result if you had to listen to testimony as to which was the best. If you take up the question now of what may be the best dustarrester of all the dust-arresters there are in the country, and when you have decided which is the best dust-arrester, you who are trying the question of the necessity of this route and the damage suffered by Backus, when you have decided to order Backus to put it in and assess his damages on the verdict that this is the best dust-

arrester-are you going to have all the dust-arresters of the country

before you? Are you going to give damages by what you think it will be if he will adopt this one, and then decide for him what is the best one, on the testimony of every patentee of dust-arresters on the earth, because you have got to go into that if you are going to pick out a dust-arrester for Backus, if this testimony is admitted. I suppose the witness is the representative of some dust-arrester, and he will testify that it is the best on earth, and we will bring on, if you want to go into the question, we will bring on 24 other patents for dust-arresters—

The FOREMAN: The jury seem to be desirous of deciding this

matter without any further argument.

Mr. Baker: I would like to make a few remarks to the jury upon this question. You have heard an argument from Mr. Dickinson which may sound very plausible to some of you, but if you will recur to what has taken place on this trial, you will

see that we are entirely right in the position that we take in regard to this matter. In the first place, this jury, when they went down to look at these premises, were very carefully shown a dust-arrester made of burlap. Mr. Backus was very careful to testify that that was a dangerous construction, that it was made of burlap, upon which the dust collected on the inside of it, and it was necessary to have openings in the building, through the lattice-work, through which the air could escape. He was very careful to point out to you that the wind, as it came diagonally across these premises, might blow sparks from the engine through this lattice-work, so that they might possibly catch upon the burlap, this inflammable stuff that we saw there. He tried to make out to you, gentlemen of the jury, that this was of such a dangerous character that the presence of an elevated railroad upon that street would cause his property to burn up in a very short time, and it would make it necessary, according to his judgment, for you in this case, in order to do justice to him, to give him the entire value of it before it did burn up, that you award to him \$150,000 of \$200,000 here because he is going to be burned up with this dust-arrester by the railroad that will be operated in the street. It further appeared, from the testimony of Mr. Backus, that this dust-arrester that he first put up in 1882 and 1883, and that it was put up on a patent of his own. He was very careful to testify to you that that was the best dust-arrester of which he knew anything, that it did the work satisfactorily, and was perfeetly safe, and all right as far as his own plant was concerned. But upon cross-examination, it did appear substantially, and he had to admit it, that this dust-arrester, while it did do a successful business for a few years after it was first adopted, was eventually supplanted

by something else, which has taken the trade, which has
1156 done the business since then. Would it be right for this
jury to consider this case, and finally dispose of it upon his
uncontradicted testimony that he has got the best dust-arrester?
Will it be right to have this case submitted to the jury upon the
theory that he had got a perfect construction, and that it was absolutely necessary to leave that burlap in the exposed condition that
it did, with the wind subject to blow through that lattice-work and

blow through between the openings, where a man can step through, to leave it upon his theory of the case, if it is not true, if we can show to you, as we can show to you by this witness, who is an expert in the business, a witness who formerly canvassed for a dust-arrester that is similar to the Backus dust-arrester, the only difference being that the one uses a burlap and the other uses cheese-cloth, but on the same principle, substantially the same construction. We will the same principle, substantially the same construction. show you that these two men, Backus and Kouche, were in litigation as to who owned this patent, as to who had a right to the in-While this litigation was going on and while both of them were doing more or less business, and Mr. Backus said he put in more than 80, other machines were invented, other dust-arresters were patented, and those patents were all of the same general nature, they are all based upon the same principle, the only difference being the mechanical construction of them. What we mean to show to you is that there is an absolute fireproof dust-arrester. We can show to you that there is a metallic dust-arrester, so constructed, that so far as the burlap and the opening on the roof is concerned, it is absolutely fireproof. We will show it to you by this witness that that property down there, without changing his pipes, his flues,

his fans or anything of that kind, that you can put this dust-1157 arrester in there at an expense of about \$1,300. We will show that if Mr. Backus insists upon having this obsolete and worthless and played-out dust-arrester, that a device can be put

upon that so that it will be absolutely fireproof.

All we want to do is to show the state of the art. We do not desire to have you decide between a large number of dust-arresters, but we would like to submit to you testimony as to the state of the art, to show how easy it is to put a dust-arrester in there that will avoid all this alleged fire risk, show to you that at an expense of \$1,300 we can avoid a risk for which they desire to tax us \$150,000, which they say that plant is worth down there, and they want us to pay the whole price of it, because it is going to burn up the minute the road is in operation; and, if we are permitted we can show that a metallic dust-arrester can be put upon the same plant. We won't distrurb anything except this construction that he has on top there, and instead of having all that burlap and stuff, they can put a contrivance there that is absolutely fireproof, and will do the same work with the same power; and it would be a little remarkable, if we want to show that, considering the testimony that they have introduced here, that you would not like to know what the state of the art is, what has been done. You have heard the testimony of Mr. Backus that he was in this business a while and then Would you not like to know what has taken the place? Perhaps some of you have had some little experience with this, and you know that there are dust-arresters in use in this city that are fireproof. I examined two of them this morning myself. They are in general use. We will show that this man has taken out a number of the Backus dust-arresters; that every large institution in the country has taken out the dust-arrester and put in metallic ones.

1158 Mr. CHAREST: I move that we go to our room and decide this question.

Mr. CHIPMAN: If the jury wish to hear a reply, I am ready to

Mr. CHAREST: My motion is to adjourn to the jury-room at once. Mr. CHIPMAN: If what Mr. Baker has said has any effect upon you, and you propose to give it any consideration, the jury should do just as the court does.

The Foreman: I know how the jury feel in regard to it.

The jury retire for consultation, and, after a few minutes, return into court.

The FOREMAN: The jury are unanimous in regard to this evidence as to the dust-arresters, that they do not want any more evidence of that kind; they have all agreed upon that point.

Mr. BAKER: What do you mean by that; that you want no other

testimony as to other dust-arresters?

The FOREMAN: We consider that we have heard enough evidence in that regard. It is the opinion of the jury that the testimony in regard to the dust-arresters is entirely immaterial.

Mr. Baker: Do you regard their testimony as immaterial? The Foreman: Altogether.

Mr. Baker: What we desire to show was that the alleged danger could be avoided at a very trifling expense.

The FOREMAN: The jury have decided. Mr. Baker: I desire to note an exception.

Q. Do you know of any instances where the Backus dust-collector has been put in and has been taken out and something else substituted?

1159 Mr. Dickinson: To that we object as immaterial.

Mr. Charest: We don't want any more.

Mr. Baker: I am going to ask some questions here for the purpose of getting them on the record.

Q. Will you state whether the Backus dust-arrester is in general use at the present time?

Mr. Dickinson: To that we object.

Q. I suppose you are an expert in this business?

A. Yes, sir.

Q. State whether or not it would be practicable to close up the lattice-work that is on the Backus dust-arrester on the roof and put in other openings so as to avoid the danger from sparks?

Mr. Dickinson: That we object to as immaterial.

The objection is sustained.

Mr. Baker: I desire to note an exception. I desire to show how that can be done. It seems to me you ought to listen to that.

Mr. Chipman: It is the same thing.

Mr. Baker: It is not by the use of screens, but by another device which is very simple, and it will take just a moment to put it in. The FOREMAN: The jury have decided not to admit this testimony.

Mr. Baker: I desire to show how easily that can be done.
Mr. Julien: Have we any power to make them change it?

Mr. Baker: There is no doubt about it. It would be ridiculous to say that you could award him very large damages when you could save the damage by a slight expense. I want you to hear

the testimony and see whether you think it is reasonable that he can claim very large damages when, by a few dollars

expense, he can save it all, and I want to show by an expert who can fix that with a very few dollars' expense, so that there is no danger from sparks, leave the dust-arrester right there as it is, and put an attachment on there to avoid the sparks.

The FOREMAN: Suppose you introduce the evidence, would not

the other side claim the same right?

Mr. BAKER: Certainly, they can put in surrebuttal.

The FOREMAN: Then we extend this case.

Mr. Baker: No more than any lawsuit is extended. It is the simplest kind of a device that can be put on, if I can be permitted to show it.

Mr. CHAREST: I call upon the foreman to enforce the ruling.

Mr. Baker: I understood the testimony was ruled out as to other dust-arresters. What I want to show now is with reference to this dust-arrester.

The FOREMAN: It was all dust-arresters, as the jury decided.

Mr. CHAREST: We want that ruling enforced.

Mr. Baker: If such is the decision of the foreman, and you are

The Foreman: It is not the decision of the foreman, it is the

decision of the whole jury.

Mr. Baker: I desire to note an exception. I can assure you this is very valuable evidence that would render you great assistance.

Mr. McIntosh, recalled for petitioner.

Examined by Mr. BAKER:

Q. Do you know a man by the name of Martine?

A. I don't know him personally, I have heard of him.

Q. He has given some evidence in regard to a street, as

Q. He has given some evidence in regard to a street, as damaged by the elevated railroad in New York, called Pearl street; are you familiar with that street?

A. I have been through there.

Q. He has also given some testimony in regard to Greenwich street, and also some testimony in regard to the American Bank Note building, that I desire to ask you about; do you know what the award was for damages to the fee of the American Bank Note building?

Mr. Dickinson: I desire to object.

Mr. Baker: You proved that it was \$135,000.

Mr. Dickinson: I will state my objection without argument.

They have insisted before you that they open their proofs first, and they did. They have contended before you that they had a right to open their proofs, and they have. They have gone into the question of the elevated road, have they not, and exhibited the map, have they not, and given you all the testimony they chose to introduce, without objection by us, as to the effect of the elevated road in New York. This witness testified as to the line on Pearl street; he testified as to the line on Greenwich street, where the bank note company is; he testified as to the line on 6th avenue; he testified as to the damage these roads occasioned; he left the stand after cross-examination. He was called all the way from New York. Opportunity was given this union depot company to call any number of witnesses they pleased upon the same point. They chose to rest their case, merely upon the testimony of Mr. McIntosh. then thought it important enough, inasmuch as the testimony was here as to the elevated-railroad structures and the results, to send to New York, at a large expense, to get the best testimony we

could reach. We are obliged to pay for such testimony, because we cannot subpœna witnesses from New York. best testimony we could get we produced. We could have produced more, but that testimony we set against the testimony they produced; thought it was sufficient for us to produce this testimony against the testimony of Mr. McIntosh, upon which they chose to rest their New York testimony. We chose to rest our testimony with the testimony of Mr. Martine and the testimony read from the other trial. Now they seek to go into the elevated-road matter again, on the bank note case and on the Pearl Street matter, and go into that part of the case again. If they do it we may do it in They may reply again, they may do it again, if they have any more important testimony than they have when McIntosh was produced, if there is going to be material testimony upon this question, if you permit it to be produced we insist upon our right to supplement our New York testimony with other witnesses.

Mr. Baker: As far as that is concerned, they have introduced certain testimony that we desire to directly contradict. We desire to contradict the testimony of their New York witness; it is strictly in rebuttal, and this whole argument that we cannot put in any rebuttal testimony, because they would have a chance to come again is ridiculous. It is done in every court. The side that opens has the right to put in its case, they put in the defense and then we put in a rebuttal of their testimony, and if there is anything for them to contradict they can bring in testimony in sur-rebuttal.

The Foreman: Did not this witness give evidence in regard to

the bank note company case?

Mr. Baker: No, sir, Mr. Martine gave testimony in regard to that, and he testified that the award was \$137,000. I desire to show how that award was made up.

1163 Mr. Charest: He has learned that since he was here.

Mr. Baker: He knew it while he was here. We did not go into it at that time, because there was no testimony to contradict. The Foreman: This is entirely in rebuttal.

681

Mr. BAKER: Certainly. All the testimony I have offered is entirely rebuttal, but this is peculiarly so.

The FOREMAN: Won't the other side bring in rebuttal evidence?

Mr. BAKER: They have a right to bring it in.

Mr. CHIPMAN: I say to the jury now, we certainly will. We will demand the right to do it. It is our duty to do so. If you go into it with one you must go into it with the other.

Mr. BAKER: The rule in court is that you can introduce testimony as long as it is proper on that side of the case; there is no rule that

cuts it off at any proper time.

Mr. Dickinson: I suppose some of the jurors know that there is

an orderly proceeding in court to stop a case at some time.

The FOREMAN: I do not think the jury want to hear any new evidence, but if it is only in rebuttal, we will hear it.

Q. Will you state what the award was in that case, in the two cases, in favor of the American Bank Note Company?

A. \$90,000.

Q. What was the value of the property?

A. I do not know myself; but it was testified to in the neighborhood of \$900,000.

The FOREMAN: What have we to do with that?

Mr. Baker: It is merely to assist you.

that particular question. We consider this testimony, without taking up a minute of your time, as utterly illegal. The jurors have stated reasons which I think a court would listen to and give weight to, as showing its illegality, but there are other reasons, and we wish a ruling upon this class of testimony. Of course every time a question is asked, if we get up to object, it is going to take up so much time. We object on this ground that what damages are given in New York, or are given anywhere else, is no guide for you, and can be no guide in law, and we say such testimony should not be received.

The FOREMAN: It does really look immaterial.

Mr. CHAREST: And besides that, what this man has been told he

cannot come and swear to.

Mr. Chipman: We would like the jury to pass once for all upon it, because, if this is going on, we have got to take other testimony, and bring witnesses on from New York to meet this young gentleman.

Mr. Baker: This testimony is already admitted.

Mr. CHIPMAN: We move to strike it out.

Mr. Charest: The witness was going to come here and swear to what he knew personally; he cannot come here and swear to what other people told him, and as a juror, I object to it.

Mr. Baker: I believe Mr. Lesher is foreman of this jury, and when you want to make any argument you ought to go out into

the jury-room and discuss it.

The FOREMAN: The jury seem to think that that is entirely immaterial.

Mr. Baker: If it is stricken out, I take an exception.

Q. Do you know whether it was the elevated road that caused the rents to depreciate on Pearl street, or other causes?

Mr. DICKINSON: To that we object.

A. I don't know.

Q. Do you know a piece of property that Martine testified about as having been owned by his father?

A. Yes, sir; I have seen the property every day.

Q. He testifies that they bought it for some \$60,000; do you know what was paid in settlement with the elevated road?

A. The fee damages were never settled with Martine. Q. Do you know what was paid and what it was paid for?

A. The Martine estate settled the back damages prior to 1883, together with the damages to two adjacent pieces, one above and one below, on the street, for some \$7,000 or \$8,000, but the fee damages were settled with the Shasta estate subsequently, and five years' rental damages.

Q. What was settled with the Martine estate?

A. The damages prior to 1883, and the damages to two adjacent pieces of property, one above and one below.

Q. For how much?

A. I think about \$7,500; I don't remember the exact amount.
Q. Were the fee damages for this particular property subsequently

settled; what was paid?

Mr. CHIPMAN: We object.

The Foreman: That is excluded. Mr. Baker: Note an exception.

Q. You know what this was settled for?

A. I know what it was settled for. The Foreman: How do you know it?

A. I know it because I have seen the original documents that passed, and the books, and made up the list.

1166 Q. Had you anything to do with the settlement?
A. I did not pay the money.

The Foreman: I do not think it is rebuttal evidence. Mr. Baker: I will have to take an exception.

JEREMIAH PANGBORN, sworn for petitioner.

Examined by Mr. BAKER:

Q. Where do you live?

A. In the 9th ward of the city of New York, 76 Perry street.

Q. How long have you lived in New York?

A. During my natural life. Q. What is your business?

A. Real-estate broker and appraiser.

Q. How long have you been in that business?

A. Over 35 years.

2200

Q. Do you own any property on the elevated road?

A. I do.

Q. Do you know what the general height of the elevated road is?

Mr. CHIPMAN: We object.

Mr. BAKER: You tried to make out by Martine that it is some 20 feet; I desire to show that it is less.

A. About 17 feet to the top of the tie that holds the rail; it varies considerable; about 17 feet is the average height; it is 14 in some places.

Q. What effect did the elevated railroad have upon the abutting

property?

Mr. Dickinson: To that we object as not proper rebutting testimony and as immaterial.

1167 Mr. BAKER: We desire to contradict the testimony of Mr.

Martine on that subject.

The FOREMAN: The jury object to any more evidence.

Mr. BAKER: Then I except.

Q. Do you know how wide Pearl street is?

A. Yes, sir.

Q. How wide is it?

Mr. Dickinson: To that we object. McIntosh testified to the width and the line of the road, and pointed it out on the map, and had the figures here, and papers were handed to him by Mr. Baker to testify from.

Mr. Baker: I take an exception to that statement of counsel.

We can prove by this witness the exact width of Pearl street.

Mr. Charkst: I don't think McIntosh swore to the width of Pearl street. He swore that the railway was passing on Pearl street.

Q. How wide is Pearl street?

A. South of Wall street, it is 40 feet wide from house to house, with sidewalks about ten feet wide; north of Wall street, it is 44 feet wide, with sidewalks ten feet six.

The Foreman: Have you measured it?

A. No, sir, I have the measurement directly from the engineer, who did measure it.

The Foreman: It is merely hearsay.

A. No, sir, I have it direct from the engineer who measured the street.

Q. Is that what it looks to be?

A. That is what it is, what I measured. I have measured it as nearly as I can by pacing it myself. It is 40 feet south of Hanover square, north of Wall street; it is 44 feet wide, the whole

square, note to be positive, and I did not take my measurement by pacing; I went to the engineer and asked him if he had measured it, and he told me he had, and he gave me his measurement.

Q. Did it agree with your pacing?

A. It did, sir.

Q. Mr. Martine gave considerable testimony here, largely heasay, as to what the rentals were upon Pearl street, both before an after the elevated road was built, in which he stated that the rentaupon that street were largely reduced, and in his judgment it we occasioned by the elevated road; did you live in New York during the years before the road was built on Pearl street?

A. I did.

Q. Were you familiar with the property upon that street?

A. Yes, sir.

Q. Were you familiar with the property after the road was built A. Yes, sir.

Q. And the business that was done on the street?

A. Yes. sir

Q. Will you tell us what affected values, if anything, on Pear street?

Mr. CHIPMAN: We object.

Mr. BAKER: I desire to show it was from other causes, the move

ment of population, and not the elevated road.

Mr. Chipman: We object on this ground, that they have gon on and given their testimony, Mr. Joy, Mr. McIntosh and other to the effect that the elevated roads did not interfere with or affect the value of property at all. That was the judgment of those witnesses. We brought a witness here who gave his judgment, and now they have another witness here to give his judgment, and you

will never get done at that rate.

Mr. Baker: We have only had one witness in this case who has testified to what caused the depreciation on Pear street, and that was Mr. Martine, and I claim the right to contradic him. McIntosh did not testify as to the rentals upon Pearl street at all.

The Foreman: I think you may answer that.

Exception for respondents.

Q. Will you tell us what caused the depreciation of rentals upon Pearl street?

A. It was caused by the removal of the business from that portion of the city to another portion.

Q. What business was done upon the street before the elevated

road was built?

A. About 40 years ago Pearl street used to be a very large dry goods district, which ran from Wall street down to Hanover square A very large dry-goods trade was done there, and after awhile the wholesale business commenced to go north and west. Years ago 55 years, it used to be a retail trade up to Maiden Lane. The wholesale business was in Hanover square, a very large dry-goods business. It moved from Hanover square into Broad street long before the elevated road came. From Broad street it went into Broad way, from Broadway to Reed street; it kept moving northward and westward from Hanover square. That left the street in what we

call a transition state. The dry-goods trade had gone. From 1870 to about 1877 it was in a transition state. It was so in Front street and also in Water street. That wholesale business went northward and westward, and left the street in that transition state; and after that it got into the cotton business, and the cotton business stayed there until the cilmen got there. The cotton business —

to occupy the whole building, used to store all the cotton 1170 in the building, and after that was got through with they sold

by samples, and it left all the building upstairs useless, and they had to utilize it in some way. They rented it out for offices. The oilmen got in there then, and after the oilmen commenced to go, the rents began to go down, from the fact that they built a large building on Broadway, more commodious and with better accommodations for their business.

Mr. CHAREST: When did the oilmen go into Pearl street?

A. After 1880.

Q. When did the railroad go into Pearl street?

A. In 1878; business has been continually going northward from the lower part of the city.

Q. Was any of this business driven off that street by the elevated

road?

A. All this was done before the elevated road came there; after the elevated road came there, the oilmen got in.

Q. Were they driven away by the elevated road, or for other

reasons?

A. For other reasons; the elevated road benefited it; the property, the fee is worth more than it was in 1872, before the transition state; other business came in, and it has been occupied for different purposes.

Q. How is it on the Bowery; that is another street that Mr. Mar-

tine referred to?

A. Bowery was the same way; it changed its character. Property on the Bowery today is higher than it ever was, take it from one end to the other, the fee.

Q. Are the rents any higher today on Pearl street since the ele-

vated road was built, than they were previous?

1171 A. Yes, sir; they are higher than they were before the railroad came there; from 1873 to 1877 you could not get any reasonable rent; the panic occurred in 1873, and it lowered the prices.

Q. I mean previous to that time.

A. Previous to 1873 property was pretty high; they occupied it for the dry-goods trade and they paid pretty good prices, because

they occupied the whole of the building.

Q. Is it not true that the panic of 1873 caused a very great reduction in real-estate values and rentals in the city of New York, and especially in the streets that were in a transition from 1873 to 1878?

A. It did; the falling off of the fee value of the property was from 30 to 50 per cent. throughout the city, as a general rule.

Mr. JULIEN: You say the dry goods moved from Pearl street to Broad street, and from Broad street to Broadway?

A. Yes, sir.

Q. After it left Broad street, did the property depreciate in rental

value as Pearl street did?

A. Not so much, because Broad street was more of a brokers' street; the stock exchange was there, has been there ever since; Broad street did not feel the effect as Pearl, and Front and Water, but it did feel the effect.

Q. Has Front street an elevated road?

- A. No, sir; Front street and Water street have no elevated railway.
- Q. Are there a number of streets in the same vicinity where there are no elevated roads that the same causes operate?

A. Water street and Front street are the same way.

Q. The same depression? A. Yes, sir. 1172

Q. Mr. Martine gave some testimony in regard to Greenwich street; are there any other streets near that that are the same kind of streets?

A. There is Washington street, the street next west of it.

Q. Will you state how that street compares with Greenwich street

as to depreciation?

A. Greenwich street has not depreciated any more than Washington street. Greenwich property today is worth more than Washington Street property, and is sold for more; the last large sale particularly the property has sold for more than similar property on Washington street; Greenwich street today is worth more money as a rule than Washington street.

Q. Greenwich street has an elevated road and Washington street

has none?

A. Yes, sir.

Q. They run parallel to each other?

A. Yes, sir.

The FOREMAN: Has not Greenwich street always been more valuable than Washington street?

A. Generally it bore a somewhat higher price.

Q. Are there any streets in New York where the elevated road has increased the value of property?

A. O, yes.

Q. What streets?

A. You can take any of our wide avenues from above Twentythird street or Thirty-fourth street; take First avenue and Second avenue, Second avenue is worth one-third more in fee value than

First avenue; Third avenue is worth double what it is on Lexington avenue; Ninth avenue has increased 100 per cent.

where Tenth avenue has only increased 40 per cent.; that is because of the elevated road. You can compare Ninth avenue with Eighth avenue, where there is no road; Eighth avenue has not increased more than 30 per cent. while Ninth avenue has improved 100 per cent.; Tenth avenue had improved 40 to 60 per cent. I have property today that sold in 1868 for \$9,000, bought in 1877 for \$7,300; that property used to rent for \$500, and it now rents for \$1,260.

Mr. TRAUB: Is the rise in the rental due to wear and tear; where property remains unimproved, does it rise in value in the same

proportion?

A. Yes, more so; the buildings do not increase in value; it is the land that increases.

Q. If property was left unimproved it would still gain in value?

A. You get the same ratio of improvement; the buildings on the property do not improve it; it makes it better for rental purposes. but it is the land that increases.

Cross-examination by Mr. Dickinson:

Q. Where is your office?

A. 71 Broadway.

Q. Where are the offices of the elevated road?

A. I think they occupy a portion of that building; I have no connection with them.

Q. Next door to them?

A. No, sir, not on the same floor.

Q. How many cases have you testified in for Jay Gould and the elevated roads, condemnation cases?

A. I don't know that I have testified in any cases for Jay Gould; I have testified for the elevated road company.

1174 Q. How many cases?

A. In probably 50 or 75. Q. What are you paid for so testifying?

A. That is owing to what property it is; from \$50 to \$75 a case.

Q. You get a commission on the value of the property, is that what you mean? Do you apportion your fees for testifying in New York by the value of the property?

A. No, sir, the size of the property.

Q. You have testified in 50 or 75 cases for the elevated road?

A. I have testified in a number of cases.

Q. How near is your office to the office of the manager of the elevated road?

A. I am in the fifth story and I think the manager is in the second story. The first, second and third stories are occupied by the elevated road company. I never spoke to the president of the elevated road, to my knowledge; I know Mr. Haines, the manager.

Q. How near is his office to yours?

A. He is downstairs, in the first or second story.

Q. You have testified in 50 or 75 cases? A. Yes, sir.

Q. Have you not testified in 165 cases?

A. Not to my knowledge.

Q. Will you swear you have not testified in more than 50 or 75 cases?

A. I would not swear that I have not testified in more than 200; I do not keep an account.

Q. How much do you get in each case?

A. From \$50 to \$75; sometimes \$30.

Q. No more than \$75.

A. If you will allow me to explain, I will do so.

Q. Did you ever get any more than \$75? A. Yes, sir; you take a piece of property like the bank note company, I would get more money.

Q. You testified in the bank-note case?
A. I did not.

Q. Did you testify in the Irving Bank case?

A. I did.

Q. For whom?

A. For the elevated railroad.

Q. Do you remember Hawes testified for the property-owners?

A. Yes, sir.

Q. Hawes is one of your colleagues in testifying for the elevated road?

A. He is a gentleman and a very fine expert, and he has testified

Q. Did you testify in the bank-note case?

A. I did not, I say.

Q. Did you testify in the bank-note case that the bank-note building was benefited \$10,000?

A. No, sir; not to my knowledge.

Q. You would know whether you testified in that case; do you know Joseph H. Choate, of New York?

A. Yes, sir.

Q. Did he ever cross-examine you?

A. I don't remember ever being before Mr. Choate; I don't remember testifying in the bank-note case.

Q. Do you swear that you did not? A. I won't swear positively.

Q. Didn't you testify in the bank-note case that the bank-note property was benefited \$10,000 by the elevated road? 1176

A. I don't remember testifying.

Q. Would you not remember such a thing?

A. I tell you I don't remember.

Q. I want you to go on this record positively whether you testified in the bank-note case?

A. I don't remember testifying.

Q. Will you swear that you did not?

A. I would not like to do so. Q. Was it so long ago?

A. I have no recollection in testifying in the bank-note case; I suppose he has reference to the Seventh Ward bank.

Q. You say you did not testify in the bank-note case?

A. I did not.

Q. I am talking about the proceedings of the American Bank Note Company on Greenwich street against the elevated road?

A. I never testified in that case, to my knowledge.

Q. I will put to you this question, whether you did not testify in

that case that the American Bank Note building, the real estate, was worth \$860,000, and that it was benefited by the elevated road \$10,000?

A. I don't remember ever testifying in that case, sir; I don't

think I ever testified; if I did my evidence is there.

Q. Is there any other man of your name in the city that testified in that case, that you know of?

A. No, sir.

Q. Jeremiah Pangborn?

A. I don't think there is any other man by that name.

Q. Did you hear the testimony in the case; did you attend the trial?

A. I did not; Mr. Blackwell was one of the witnesses and 1177 Mr. Hawes was the other; I was not.

Q. You do not remember to have been cross-examined by Joseph H. Choate?

A. No, sir.

Q. Were you ever cross-examined by Andrew Foster? A. Yes, sir.

Q. And by W. G. Peckbam? A. Yes, sir; I know him well.

Q. Do you remember testifying in the Irving Bank case?

A. I do.

Q. Did you testify in the Irving Bank case as to what the benefit to the property by the elevated road would be?

A. I may have done so.

Mr. JULIEN: I don't think this will help us any.

- Mr. Dickinson: Don't you want to know whom you have before you?
- Q. Did you testify that it was an actual benefit to the Irving bank?

A. I may have done so; I think it was a benefit.

Q. How many tracks are there in Greenwich street, in front of the Irving bank?

A. There are two tracks, and, I think, a turnout.

Q. How many in front of the bank note company, on Greenwich street?

A. There are three or four, with turnout switches.

Q. In front of the Irving bank there are only two tracks?

A. To my knowledge, there may be turnout switches.

- Q. You testified in the Irving Bank case that the elevated railroad was a positive benefit to the property?
- 1178 A. I have always testified that I testified in the Irving Bank case.

Q. Did you so testify, that it was a benefit to the property?

A. I may have, and I say so today, and I will take the corner opposite to the bank.

Q. Did you hear Hawes' testimony on that trial?

Q. Did he testify it was an injury of 50 per cent. to the Irving

Bank property?

A. I cannot state what Hawes testified; I am not responsible for his testimony; there is not a better expert in the city of New York

Q. Did he come out with you?

A. No, sir.

Q. You have testified as to Greenwich street; I will ask you another question before I leave Greenwich street, whether you did not testify in the Irving Bank case, on cross-examination, that the property on Washington street had largely increased in value?

A. I don't remember; I might have testified to that.

Q. Did you not testify that the property on all the side streets had largely increased in value?

A. That may be so.

- Q. And did you not testify, on cross-examination, that the property on Greenwich street had decreased in value?
 - A. It had in some places, and others it had not. Q. Did you qualify it, and say in some places?

A. I think I did.

Q. On cross-examination, did you not say that the property on Washington street over which the elevated road did not run had nearly doubled in value, while Greenwich Street property had not increased?

A. In certain locations.

Q. Did you say certain locations?

A. I don't remember saying anything you speak of; I may have said just exactly what you say.

Mr. BAKER: We object to what he testified to in that case.

Mr. CHIPMAN: If this man has sworn to one thing in one place, and comes here and swears to another, it is proper to be shown.

The WITNESS: I have not.

Mr. CHIPMAN: I say if it should turn out that he did, I would accuse him of it, and we have a right to show it. If we have the testimony here that he gave in the cases down there, stenographically taken, we have a right to use it and call his attention to it, and any bluster and any assumption of dignity on the part of this man cannot prevent us from our plain right to contradict him and show what he said elsewhere. This is all fustian.

Mr. BAKER: My objection to this is that they cannot ask him any question of that kind where the testimony itself is not material. It is wholly immaterial what he testified in any case down in New York. It is not a question of whether it is cross-examination or not; it is a question of whether it is material in the case. It does

not make any difference what he said down there.

By Mr. Dickinson:

Q. You say you may have sworn to what I have asked you, and you want to make an explanation to the jury; I have no objection.

1180 A. Will you state what I testified to, and then let me explain?

Q. No; make your explanation now.

A. You asked me if I hadn't testified to so and so; I do not know whether I did or not. Read my testimony, and I will then explain to the jury whether I did so testify; I don't know what I testified; state what I testified and then I will explain.

Q. Would you have testified what was not true at that time?

A. Not at all; anything I testified to I will stand by as being true.

Q. Is that the explanation you desire to make to the jury?

A. State what I stated then, and I will then explain. You went on to say, "Didn't you testify that Washington Street property was so and so, and Greenwich Street property was so and so," and I said that if I did, it was true, and I then went on to explain that certain parts of Washington street were worth more than it was on Greenwich street, because there is a certain kind of business down on a certain block, whereas, on the other side, Greenwich street, it is a poorer class of business; but take one end of Washington, you will find that Greenwich street is worth more than Washington street; there is certain locations on Washington street and certain locations on Greenwich street, where it is worth more than on the other street.

Foreman LESHER: In your previous testimony did you qualify

it in that way?

Mr. Dickinson: Do you swear that you made the same explana-

tion in that case?

A. I don't say I did; I explain it to you that I might have done so; if I did testify as the gentleman says, which I have no doubt I did, if that was so, I don't remember it; but if I did testify so, it was true.

Q. The juror has asked you, and I will repeat the question so that there will be no misunderstanding of it: Did you make that qualification that you have just made to the jury in explanation?

A. I don't remember of doing it; I may have done so: I don't

remember.

Q. Did you testify as to the rental value of 93 and 95 Greenwich street in 1877?

A. I testified on a number of cases.

Q. In the Irving Bank case?

A. The Irving Bank case, I testified in.

Q. Did you testify as to the rental value of 93 and 95 Greenwich street?

A. I may have done so; I am not positive.

Q. Did you testify that the rent in 1877 was \$4,900?

A. I don't remember.

Q. And in 1889 it was \$4,000—on cross-examination?

A. That may be.

Q. In all property in that portion of the city, on Greenwich street, there was a general advance from 1877, was there not?

A. No, sir; not general advance.

Q. From 1877 down to date?

A. From 1877 down to date there has not been a general advance.

Q. In property in that part of New York, will you tell this jury whether you didn't testify in the Irving Bank case that there had been a general advance in all real estate values in the lower part of New York on Greenwich testate values.

lower part of New York, on Greenwich street, and Washington street, and adjacent streets, since 1877?

A. There was a general advance.

Q. Did you so testify?

A. I don't remember. There was a general advance, not entirely from 1877. The panic did not spend itself until about 1880, but there was a general rise from 1878 or 1879, after 1879. The lowest

point of the panic was between 1876 and 1877.

Q. Never mind the panic; we know all about the panic here. Now, after having testified that there was a general advance throughout the lower part of New York, including Greenwich Street and Washington Street property, did you not testify on cross-examination, that that advance had not been felt on Greenwich street?

A. Not to the extent of some other streets it hadn't, and has not

today.

Q. Did you put that word "extent" in your testimony?

A. I don't know what I put in. If you read my evidence, I will tell you.

Q. Did you put in the qualification of "extent"—not to the extent?

A. I don't remember.

Q. Did you qualify it in any way?

A. I don't remember; it is a long while ago since I testified.

Q. How long?

A. I don't remember; the case will tell you there; I cannot carry in my head every case I testified in.

Q. Did you testify as to the rental value of Nos. 93 and 95 Greenwich street, No. 88 Greenwich street,
No. 40 Greenwich street, No. 25 Greenwich street, No. 523 Greenwich street, No. 501 Greenwich street, No. 458 Greenwich street, No. 458 Greenwich street,

wich street, did you testify as to those?

A. I don't remember about testifying as to No. 458 Greenwich street.

Q. You are right as to that, but as to the others you did testify to them?

A. I don't remember all the numbers.

Q. Did you, after testifying that there had been a general advance in New York, on cross-examination testify that 93 and 95 Greenwich street, which is a five-story brick, double tenement, rented in 1877 for \$4,900, and in 1889 for \$4,000?

A. I don't remember.

Q. Did you or did you not?

A. I don't remember whether I did or not. I cannot remember my testimony in every case.

Q. Did you testify as to 44 Greenwich street, that the brick store

and tenement No. 44 Greenwich street rented for \$3,200 in 1877 and for \$2,200 in 1889?

A. I don't remember testifying to it. It may be so. If I testified

to it it is so.

Q. Did you testify as to No. 88 Greenwich street, that the fivestory brick tenemant-house, 88 Greenwich street, rented in 1875 and 1877, for \$4,200, and in 1889 for \$2,650?

A. I don't remember.

Q. Did you testify as to 40 Greenwich street, that it rented in 1875 and 1877 for \$2.750, and in 1890 for \$2,200?

A. I may have done so; I don't remember what I testified.

Whatever was testified was true.

Q. Did you testify as to 525 Greenwich street, that the total value on sale—this was a sale of 525 Greenwich street—was, in 1877, \$18,000, and that it sold on August 30, 1890, for \$15,000?

A. I guess you are wrong.

Q. \$18,000 in 1877, No. 525 Greenwich street? A. I don't remember testifying in that case.

Q. Do you say you didn't?

A. I don't remember.

Q. Do you own any property on Pearl street?

A. No, sir, not now. Q. Did you ever?

- A. I think I did some 25 or 30 years ago; I am not positive, but I think I owned some then.
 - Q. You do own some property, I think, on West End avenue?

A. No.

Q. Don't you own some property on West End avenue; didn't you testify in the Charles Buck case that you did?

A. Where is that property?

Q. In New York.

A. What street is it on?

- Q. Do you know of any streets on West End avenue that you owned?
 - A. I don't remember; I might have done so. Q. Do you know where West End avenue is?

A. Yes, sir.

- Q. Where is it? A. It is in Harlem.
- Q. You asked me where it was; you know where it is.

A. Yes, sir.

Q. Did you own some lots there?

A. I don't remember; I may have owned some there. I 1185 buy and sell a great deal of property today, and then sell tomorrow; I don't remember where I owned it. I buy at auction and sometimes sell before I leave the exchange.

Q. You cannot remember whether you owned lots there?

A. I may have done so.

Q. You don't know whether you owned lots on West End avenue?

A. I think I did; I don't remember whether I did or not. I own property today on Greenwich street and on Third avenue.

Q. Do you remember that you sold lots for \$18,000 on West End avenue, your own lots?

A. That may be so.

Q. But you could not remember the little matter of \$18,000?

A. No, sir; I don't remember. I sell a great deal of property; I cannot tell where it is or how it is. I buy at auction and sell it right over.

Mr. Baker: Gentlemen of the jury—under the rulings you have made, the important testimony that I desired to introduce is probably excluded; but I offer to prove, by Col. Frank J. Hecker, that at the Peninsular car works, in this city, they took out the Backus dust-arrester and put in the Cyclone dust-arrester, which is fire-proof, and operates at the car works better than the Backus dust-arrester. I desire, also, to show, by Mr. William F. Dwight, that they use a metallic dust-arrester in their planing mill, at the junction of the Michigan Central and the Bay City roads, out towards West Detroit. I would also desire to show by him that he handles his lumber from the cars and in his yard without teams, but with tramways, two and a half feet tramways, and without horses, with

small hand trucks, and does it economically. And that is about all the testimony I desire to introduce, but, under the rulings that have been made here, as I understand it, you

have excluded that testimony.

Judge CHIPMAN: Yes; the rulings cover every bit of that testi-

mony.

Mr. Baker: I can show by a large number of people in this town that are using these metallic dust-arresters, that they are better and safer.

Foreman Lesher: The jury seem to think that they do not care about reconsidering their action about what they have said already.

Mr. Baker: I don't know but what, in cases at home here, they

might go and look at it.

A JUROR: My impression is, that if the dust-arrester is so much better—I don't know whether it is or not, and I don't want to look into it—I don't think we have any business to look into it; my way of looking at it is, that we could not make Mr. Backus change

his, even if we thought he had a poor one.

Mr. Baker: That is right enough in one sense. You cannot make him change it, but you certainly can do this: If he persists in using an imperfect and dangerous dust-arrester, when there is a good one that is fireproof and is without danger, you certainly can refuse to give him damages, because he insists upon using an imperfect one. Of course, I do not claim you can make him change that, but if there is a good one that is fireproof, and he can avoid the damages that he asks for here, for \$1,300, why, that is all we ought to pay.

JUROR: I think we all see into that pretty well.

Mr. BAKER: Of course, under those circumstances, I do not desire to delay the jury any further.

Foreman LESHER: I think the jury understand it.

Juror TRAUB: That does not cover this entire condemnation case.

Mr. BAKER: I do not claim it does, but I can show that that dustarrester is absolutely worthless; but I am not permitted to do it. and under such circumstances, I will simply rest this case and take an exception to the rulings that are made, and I will now proceed with the argument.

Mr. Baker then commenced his argument by saying:

Gentlemen of the jury, but was interrupted by Mr. Dickinson.

Mr. Dickinson: Now, gentlemen of the jury, there is a question still remaining, as to how you will arrange for his argument, and I have nothing more to say than what I have said heretofore. I will not take time in arguing upon who shall commence the argu-The situation is that without our desire at all, we are brought into court to show cause, and here we are; we are not here by our own volition. Whether you will let us reply finally to the argument made by the railroad company, under the circumstances. is within your disposition beyond any question.

Mr. BAKER: I have the opening and closing of this case beyond

any possible question.

1187

Juror CHAREST: What about viewing the premises there?

Mr. BAKER: You can after the argument go and look at the premises if you want to, at any time before you go out, after you

have listened to the argument.

Mr. Dickinson: I ask the jury to make an order; we will be satisfied with your decision, but I ask you to decide upon the order in the argument. I shall be satisfied with whatever you do, but I want you to decide.

Mr. BAKER: I think you understand very plainly that we 1188 have the burden of proof and have the right to the opening

and to the closing.

Mr. Dickinson: Upon the question of necessity that is possible, but not on the question of damages.

Mr. BAKER: We have on both.

Mr. Dickinson: On the question of damages we are in the position of plaintiff. They are not asking money from us.

Mr. BAKER: We are asking to condemn it and to have the damages fixed, and we are entitled to the opening and closing.

The jury then retire to their room to consider the question, and remain out twenty minutes and then return.

Foreman LESHER: We have decided to go according to the rules that Judge Gartner laid down to the jury.

Mr. Dickinson: Did he give you any rule as to the question of damages?

Foreman LESHER: No, but merely as to the opening and closing.

Mr. Dickinson: But on that question of damages. Mr. BAKER: You could not have two arguments.

A JUROR: The jury did not understand whether it could be mad into two cases.

Mr. Dickinson (to Judge Gartner): Judge Gartner, in your lette to the jury, which I did not read fully, I would like to ask whethe you told the jury that Mr. Baker had the affirmative of the issue of the question of damages.

Judge Gartner: The way I look at it is this that you cannot be a superior of the state of the state of the superior of the s

Judge Gartner: The way I look at it is this, that you canno subdivide the question. The petitioner has got the affirmative, it view of the fact that the question of necessity is contested; that be

ing so, and having the affirmative, it strikes me that then can be no possible question but what under the law, the

petitioner would have the opening and closing.

Mr. Dickinson: How about the question of damages; who have affirmation of that?

the affirmative of that?

Judge Gartner: The question of damages is an incidental question. If it only resolved itself into the question of damages, thrule might be at variance.

Foreman LESHER: That is what the jury thought. They were

not satisfied exactly in regard to the rule as to damages.

Judge Gartner: I have stated the rule, as far as my opinion is concerned, and in view of the fact that the question of necessity is contested, and the petitioner is obliged to satisfy the jury in the first place, on the question of necessity, and the question of damage being merely an incidental question, that the petitioner has the opening and closing.

Mr. Dickinson: But if the question of damages were the principal question, who would have the affirmative of the issue?

Judge Gartner: I do not understand that that is the case.

Mr. Dickinson: May I ask you who would have the affirmative.

upon the question of damages?

Judge Garner: If the question of damages was the only question involved in this case, if the affirmative of the showing of damages would be upon the respondents, why, I suppose in that case they would have the opening and closing.

Mr. BAKER: But that is not the case.

Judge Chipman: Yes; the question of damages is involved here.

1190 Mr. Baker: But you cannot separate them; do you hold that they can be separated?

Judge Gartner: I say that I do not think, in any case, you can

subdivide those questions.

Mr. Dickinson: Which would your honor consider the important question, if we have the affirmative of the issue on the question of damages, and they have the affirmative on the question of necessity?

Judge Gartner: The question of public necessity is the first question involved, and the first question that the jury will have to

pass upon

Mr. Dickinson: We submit that the jury have the right to de

cide which is the important question.

Mr. BAKER: Does the jury decide that the petitioner has the opening and closing?

Foreman LESHER: Unless you can make two cases of it.

Mr. Baker: Is it proper to make two cases of it, Judge Gartner? Judge Gartner: I should say it is not proper.

Mr. Dickinson: Then I will say to the jury that they are not

bound to take the direction of the judge.

Judge GARTNER: My opinion was asked by counsel in this case,

and the jury are supposed to follow what the law is.

Mr. Dickinson: We take an exception to the direction of the judge. If you desire to consider any statement of the judge upon this question, gentlemen of the jury, you may retire and consider the matter.

Mr. Baker: The circuit judge has made a ruling here and has told you what the law is and what your ruling should be, and they

have appealed from the circuit judge.

Mr. Dickinson: Gentlemen of the jury, you have 20 minutes yet before it is 5 o'clock; will you listen to the ruling of the supreme court.

1191 Foreman LESHER: Yes, sir.

Mr. DICKINSON: I will read it to you.

Mr. Baker: If your honor please (to Judge Gartner), I desire the court to listen to an argument in this case as to the power and jurisdiction of the court and the jury in the case. The court has decided it for you, gentlemen of the jury, and Mr. Dickinson desires to appeal to you from his decision.

Mr. Dickinson procures a volume of reports, and then says:

Mr. Dickinson: Gentlemen of the jury, there is also a case in the 83d Michigan, which is not in the judge's library, but which I will call your attention to tomorrow, but here is a decision in the case of The Toledo, Ann Arbor & Grand Trunk Railway vs. Dunlap, in 47 Mich., 456, a decision by Chief Justice Campbell. I will read

from it to you:

"This is an appeal from proceedings to condemn lands"—precisely like this case in every particular. "It appears that immediately after the confirmation of the proceedings which were afterwards set aside by this court, the company took possession of Dunlap's land and built its road across the part sought to be condemned. This was done in December, 1880, and led to a series of controversies not yet determined. The present proceedings were begun on the 18th day of June, 1881, by the presentation of a petition to the circuit court for the county of Oakland, where a jury was drawn and subsequently rendered the verdict complained of. During the pendency of the proceedings, and subsequently, certain orders were made by the circuit court, to which reference will be made hereafter.

"Some important questions arose which require a brief 1192 preliminary reference to the nature of these proceedings.

The statute is evidently framed in accordance with the laws of some other States where the judicial power is not parceled out as it is here, and some complications have been caused by this practice, which introduce difficulties. We had occasion in the case Michigan Air Line Railway vs. Barnes, 44 Mich., 222, to point of some of these difficulties. It is greatly to be regretted that the species of legislation has been so carelessly framed.

"In the present case some steps appear which could only have been taken by a court-in the regular exercise of judicial power while others belong to a different class of functions entirely, an

are governed by different consideration.

"Under our constitution such powers as are strictly judicial is their character can only be vested in certain courts which are name in the constitution itself. The circuit courts, as courts, have such powers. The judges, as judges, out of court, do not possess them

and cannot be vested with them.

"The proceedings to condemn lands, although made under the railroad laws, subject to judicial review and supervision for certain purposes, are not in themselves, and never have been, regarded a judicial proceedings. Our constitution allows them to be conducted by highway commissioners in some cases, and by specially appointed commissioners or juries of freeholders. The inquiry in this State, as elsewhere, is an appraisal or estimate of values, and not a contest on litigious rights, and includes what is not elsewher included, an inquiry into the necessity of the proposed taking for public purposes, which was never made by courts, but always here

tofore by the legislature or some unjudicial body of its creation. Had it not been for the specific provisions in our constitution, the State could have provided for these inquiries

stitution, the State could have provided for these inquiries to be made by any medium it might select. Our present system is better calculated than the old one, if fairly applied, to secure the rights of land-owners. But the nature of the proceeding remains as before, a special proceeding by a temporary tribunal, selected for the occasion, and not a judicial proceeding in the ordinary sense.

"As provided for under the railroad laws, there are certain proceedings in court to select a jury, and subsequent proceedings to determine whether the action of the jury should be sustained. Be you'd this, the courts have no part in the matter, and, with the exception of some special matters to be referred to hereafter, no difficulties should have arisen to confound these functions. But it is manifest they have been confounded to some extent here, and the question may arise how far such confusion may have caused mischief which we can redress."

I said to you yesterday, gentlemen of the jury, that if the judge came here and made an error, we had no remedy, because we had

to take your judgment of the law.

The court continues: "It may be said in brief that if a jury has been summoned under proper circumstances, has conducted its inquiries legally, and with due regard to private rights, and has reached a legitimate conclusion as to the necessity of the condemnation and the compensation, the appropriation of the land, upon payment of that compensation, will be lawful, and will not be affected by collateral action by the judge or court, which may be

unlawful. The distinction between the different tribunals is essential. The objections taken may be divided into classes, the one relating to the sufficiency of the condemnation, and the second

1194 to the action of the court or judge, independent of the inquest. Reference will first be made to the latter. These are, first, action taken by the circuit court to restrain legal proceedings, second, action concerning certain moneys, and third, action

requiring the land-owner to pay costs."

Now, upon the question of legal proceedings and the influence of the judge. Here in this case it was complained by the appellants that the judge had made an error in his ruling. The supreme court hold that it was no cause for setting aside the proceedings that the judge made the ruling, for the simple reason that the judge had no business there; it is not for the jury to abdicate its duty for any man. I read from the decision:

The remaining errors assigned refer to various rulings and testimony bearing upon the question of public necessity. Some of them have been raised on what is a mistaken notion of the character of these proceedings. The circuit judge attended the sittings of the jury and admitted or excluded testimony and charged the jury

precisely as on a trial.

"The judge formed no part of this special tribunal. The statute indeed allows the judge to attend said jury, to decide questions of law and administer oaths to witnesses. But the same statute which allows this allows him to designate a circuit court commissioner for the same purpose, and also allows the jury to proceed without either. Whatever the language of this statute literally construed may mean, it is very clear that any such functions must at most be advisory," the distinction between advisory and directory I think any intelligent man can understand. You can ask the opinion of any judge, but you can determine whether you follow it or not. Mr. Baker has asserted that you have got to take the direction of the judge; I say you have not.

"The jury will undoubtedly be regarded as accepting and doing what they permit to be done. But in all such cases the constitution as well as the principles of the common law

make them judges of law and fact."

We cannot assign error, because the supreme court holds that whatever is done, whether you do it by the advice of the circuit judge or by your own consciences, it is your own act, and we are concluded and barred by your act. So you must beware about putting any other judgment in this case upon any question except

your own.

"Their conclusions are not based entirely on testimony. They are expected to use their own judgment and knowledge from a view of the premises, and their experience as freeholders, quite as much as the testimony of witnesses to matters of opinion. And while an appellate court is bound in such cases to set aside proceedings which appear to be based on false principles, it cannot properly deal with rulings as if they were expected to on a common-law trial or dispose of the controversy on merely technical notions.

"In the case before us the jury have in proper form decided the improvement to be one of public necessity. They had a considerable amount of testimony before them bearing on that question, and it was strongly contested. While the language of the charge of the judge is certainly ambiguous and open to criticism, yet it appears distinctly that the jury regarded not merely the necessity of the land if the road should be laid out, but also the importance of the road itself. We cannot say from an inspection of the record that there is any prevailing reason for holding that the jury were misled in their conclusions."

Gentlemen of the jury, I will read from the 83d Mich., when I can put my hand on it and bring it before you, from the opinion of Judge Campbell. And I will put a mark in this book, from which I have just read, so that any of the jury may read

the decision of the court of last resort in this State upon such

question.

Mr. Baker: Mr. Foreman and gentlemen of the jury: Having been one of the counsel in the case that my brother cites, I am entirely familiar with this decision, and I desire briefly to call your attention to exactly what was decided. The statute under which you are acting in this case contains this provision: "Said judge or a circuit court commissioner to be designated by him, may attend said jury to decide questions of law and administer oaths to witnesses, and he may appoint the sheriff, or other proper officer, to attend and take charge of said jury, while engaged in said proceed-

ings."

Now, that is what the legislature of this State has enacted, and while it is undoubtedly true that it is not a judicial proceeding in the sense that it is a trial between parties in ordinary litigation, at the same time it partakes largely of a judicial character in its nature, inasmuch as it is an inquiry to be determined partly upon testimony and partly upon a view of the premises by Of course the constitution contemplates that the question of necessity and of damages shall be ultimately decided by the jury, and what Judge Campbell says in this opinion is that it is competent for the jury to take the advice of the circuit judge. Now in this Dunlap case, we tried it at South Lyons in this State; the jury was impaneled at Pontiac; we went to South Lyons, where the property was situated, and where it was sought to acquire a right of way through Mr. Dunlap's farm. Judge Turner, one of the oldest circuit judges of this State, for years he was circuit judge in the Genesee, Shiawasee and Tuscola

1197 circuit, now a very old man—he attended that jury; it involved him in some expense, and the parties, between them, paid his traveling expenses; he went and conducted that trial, ruled upon the questions of evidence as they arose, and as a matter of course we had an orderly proceeding. He made his rulings, and in the end he charged the jury, gave them certain instructions. We

complained of those instructions as being too favorable to the railroad company, and we assigned error. We took the case to the supreme court and alleged that the judge was wrong in his instructions, and the court held that he was not; among other things, that they were sufficiently fair, and that it appeared that the jury had decided the question of necessity correctly, namely, in favor of the

company.

In this case, you are assembled, as that jury were. We did not have a judge in this case, because we could not get one; we have not had a judge in any of these cases, because we could not have one; they were engaged in other cases. During the progress of this case a question arose as to the burden of proof, and the foreman, under your direction, asked the circuit judge his opinion and advice in regard to it, and he has given it. It seems to me that ordinary courtesy, ordinary respect for a judicial officer, would lead this jury to follow that advice. I have not asserted that you cannot go out and disregard that ruling, if you see fit. You can do anything you have a mind to; you can shut out any testimony, and you can shut me out entirely so that I cannot be heard. But you have asked the advice of a judge; he has given it; he has told you that the affirmative is upon the petitioner; he has told you that it is not proper to subdivide the case and make two arguments;

and still Mr. Dickinson turns round and consumes half an hour here, and asks you to disregard the advice that you have

solicited, the advice that has been given disinterestedly, and the advice that seems to accord with your own judgment as to what should be done, and it is a struggle on the part of my learned friends here to see whether they should have the last say in this case. We are the petitioners in the case; we desire to have a decision upon the right of way, and to have a right of way upon the question of necessity, and to have an award in this case; but that Mr. Backus and his sons shall not be paid any more money than they are justly and fairly entitled to. The orderly way to conduct this case is for me to open the argument, then for my learned friends to make their argument, and for me to reply, and then it will be in your hands I do not think I could change your opinion by havfor decision. ing the closing argument. My brothers seem to think that they can carry you off your feet and get anything they ask. I merely insist upon it because my client is entitled to it, because my client has the affirmative of the case, and I desire to satisfy you, if I can, from the evidence in the case and your own knowledge of the case, that the necessity should be decided in our favor, and that the damages in this case should not be any considerable sum of money; and, if you will permit us, at 2 o'clock tomorrow afternoon we will go on with the argument.

Mr. Dickinson: Gentlemen of the jury, you can take this case in

the 47th Mich., and look at it if you wish.

Mr. BAKER: I am perfectly willing that they should refer to this

case, and read it and study it.

Mr. Dickinson: The matter of closing the argument has nothing to do with the question of courtesy to the judge. We do not want any rights that our clients have given away on the ground

of courtesy. All I want to show is what your duty is, gentlemen of the jury. Your are the keepers of your own con-

sciences. I am not the keeper of your consciences. My opinion is that we ought to raply, and I think you have seen that there may be a necessity to raply.

Mr. BAKER: There must be something about your argument that is weak if you think it is necessary for you to have the closing.

Mr. Dickinson: I have borne those insinuations all through the case, and I can bear them now. Gentlemen of the jury, I said that whatever you did I would be satisfied; but, after all, you are the keepers of your own consciences and are to decide the matter. I shall be satisfied with what you do, only exercise your own judgment, and that is all I require. The ruling of the supreme court is doubtless based on section 2 of article 18 of the constitution of this State, which I will read to you:

"When private property is taken for the use or benefit of the public, the necessity for using such property, and the just compensation to be made therefor, except when to be made by the State, shall be ascertained by a jury of twelve freeholders, residing in the vicinity of such property, or by not less than three commissioners, appointed by a court of record, as shall be prescribed by a court of

law."

You see that the question of necessity, by the constitution itself, and the question of the value of the property, if you decide upon the necessity, is left to no court, but to a jury of twelve freeholders.

Mr. BAKER: There is no doubt about that.

Mr. Dickinson: And there is no court and no judge, and no question of courtesy. You can get all the help you like of the circuit judges, but remember that you are masters of the situation.

Adjourned to Thursday, July 9, 2 p. m.

1200

Thursday, July 9, 1891—2 p. m.

Opening Argument of Mr. Baker.

Mr. Foreman and Gentlemen of the Jury: We have spent a large amount of time in this cause in the introduction of testimony, and I have no doubt that the matter has become somewhat wearisome to you. As far as the testimony is concerned, it is evident that a great deal of the cross-examination of the witnesses for the respondents was made necessary by the very extravagant and extraordinary claim made in this case by them for damages, and while we would have liked very much to have spent a day or a day and a half more in the introduction of testimony bearing upon some of the aspects of the case, it is perhaps well enough that the jury saw fit to bring the testimony to a close and to render a verdict in this case upon the testimony that is already in, with the assistance that the view you have already had of the premises can give you, and with the further assistance of another view of the premises, if it is desired.

I desire briefly this afternoon to discuss the first question that you will be called upon to decide when you retire to consider of your verdict. That question is the question of public necessity, as it is understood, as it is defined by the constitution and the laws of this

State. The only evidence in which the necessity of this enterprise and of this route is attacked is by a claim on the part of the respondents, originally made by them before the State railroad crossing board, that this route should go on their property, along the line of Fort street. But subsequently they changed that to a claim

1201 before this jury that the route should be along the margin of

the property of the Michigan Central.

Upon the general question as to what constitutes a public necessity, there ought not to be any controversy among lawyers, or among jurymen, at the present day. We all know that railroads have been in operation in this State since about 1834. In that year, or about that time, a railroad was built from this city to the city of Pontiac, the old Detroit & Pontiac railway. That was chartered in that year, and for years maintained a railroad running out of this city to Pontiac, using the ordinary wooden rail with an iron strip upon it. I believe that the beginning of railroad enterprises in this country commenced about the same time. A very few years previous to that, railroads to some extent were started in New England and in New York, and in the eastern part of this country, and the entire railroad system of this continent, one of the greatest achievements accomplished by man, has been the growth of the last 60 years, and the largest part of it the last 40 years.

The railroad is a development. It was not all conceived and all brought out at once. As I remember the history of it, it started with the original tramway in some of the coal mines in England or in Scotland. They used wagons or carts with which they hauled the coal out of the hillside down to the water's edge, or to the road-side. They hauled these vehicles loaded with coal along an ordinary road, and it was found that in the constant use of the road it would become defective. If there was a rain, holes would form, ruts would form in the road, and in their desire to get the coal out

it occurred to somebody where there was a hole to lay a board or a strip of lumber to go over the rut that had formed in the 1202 road, and whenever a hole broke out in some other place,

they laid another strip down there, and gradually it dawned upon them that they could lay strips of timber along like that and have a tramway. They did not even think of the tramway in the first instance, in its entirety, but in that way they found out they could draw a bigger load with less power in the use of a vehicle After the discovery of steam, its application as a motive and rails. power was applied, and they built railroads, and it gradually developed into the great system that it now is. It became evident, in the very inception of the business, in the very commencement of railroad construction in England and in this country, it became evident that railroads could not be built unless some power was exercised on the part of the government to compel property-owners to relinquish a right of way for a reasonable price. It was found out that if you laid out a roadway any considerable distance through private property, that while you might buy the first man and the second man, and a third man and a fourth man, and gradually acquire a greater portion of it, in the end you would find some obstinate property-owner, some man who thought he had something that was better than anybody else had on earth, and either from motives of pride or avarice, or something of that kind, would not sell a right of way under any circumstances, so that the enterprise would have to stop right there, unless the government exercised a power of this kind. It has been illustrated time and time again. There is hardly a great street that has been laid out in the city of Detroit but what some property-owner has objected to it, and would have fought it to the bitter end, if there was no power in the city government to compel him to take a reasonable price for the right of way,

where a public highway crosses his property. Some of you 1203 may remember cases of that kind in the eastern end of the city.

My attention has been called by an old resident to a controversy of that kind between this city and Governor Woodbridge, who owned a farm just this side of the Backus property. He had a farm extending from the river back to the line of the private claims, and it was desired to open Fort street west of Lafayette avenue, through his property, and he contested it bitterly, insisting that he had a right to enjoy his farm-house and his orchard, and they should not be taken by the people of this city who desired to make a highway of it. But he was compelled to give way, and upon that farm, at the present time, there are thousands upon thou-This is something that is necessary, from the sands of people. nature of man, from the natural condition of the human mind. A man has a piece of property. He desires to realize as much as possible from it. If a right of way is put through it, and if he has it at his mercy, he will charge just what he sees fit; he will insist upon having an exorbitant and an extravagant price. It occurs every day, so that if it is necessary, in order to build highways, in order to build canals, in order to build railways, in order to build works of public convenience that require continuous strips of land, it is necessary to exercise this right of eminent domain.

Under the laws of this State, railroad corporations, from the very commencement, have been vested with the power to condemn land for the public use, the theory of the law being that a railroad is simply a highway formed by a private corporation, partly at any rate operated in the public interest, and that it is perfectly competent, right and proper to exercise the power of eminent domain.

When the Fort Street Union Depot Company first started 1204 out to acquire its depot grounds, and its right of way, our distinguished friend, Mr. Don M. Dickinson, insisted before Judge Reilly, and before the jury in the Morton case, that it was not a public use, that we could not condemn property at all, that we could not take union depot grounds and we could not take rights of way, that the statute which undertook to confer this power upon union depot companies was unconstitutional and void. But, gentlemen of the jury, Judge Reilly held that he was wrong. The jury before whom we tried that case held that he was wrong. He took an appeal to the supreme court of Michigan, and the supreme court of Michigan, in a very concise and well-considered opinion, held that he was wrong, and that there was no question, as Judge Morse

put it in deciding that case, there was no question but what the Fort Street union depot enterprise was a public work that would be of very great public benefit, and in behalf of which it was competent to exercise the power of eminent domain, and the court said, in so many words, that they approved of the decision of the jury that it

was a public necessity.

In that case this whole plan, this whole scheme, was laid before the jury and the court. Not only was the plan of the depot grounds, where we sought to acquire 5½ acres of land, but the map and the survey by which we were to reach those grounds, was before the court. The case itself was a case that involved land for the depot ground, but of course these depot grounds are of no use unless you can reach them. They are of no earthly use unless they can be reached by connecting tracks. I do not think anybody would

question the good sense of the company in locating those depot grounds where they are. It is certainly self-evident, it

seems to me, that with the construction of the new postoffice, the location of the large and expensive hotel (the Cadillac)
that has recently been built in this city, the court-house, the city
hall, where we now are, and eventually some sort of a county
building, that it is perfectly evident that this depot is advantageously and properly located for the purpose of doing the public
business, for the purpose of accommodating the people who live in
this city, who desire to go out of the city, who desire to send
freight out of the city, and to accommodate people who live in
the country, who live in other States, who live elsewhere in Michigan and Canada, who desire to do business with the city. I do
not think that any argument can be made that would show that
this is an improper location.

But my brethren upon the other side say that we ought to go along River street. That did not occur to Mr. Backus when he and Luther Beecher were up before the State railroad crossing board. He had no idea of that at that time. He insisted that we ought to go through his property, and why? Why did he want us to go through his office, to go through his dry kilns, through between his mill and Fort street, and not on River street? Gentlemen, it is simply because he desired to dispose of that property, and he knew if the railroad went through it he would be in a position, practically, to sell that entire property to the company; that it would have such an effect upon the property that he could claim, at any rate, very much more extravagant damages than he can claim with the present location. He urged that route because he

wanted to sell. He still wants to sell that property.

But what did the State railroad crossing board say about 1206 it? The statute under which that board is created (I think I read it in the opening of this case to this jury) provides, in so many words, that that board shall determine the place where

in so many words, that that board shall determine the place where and the manner in which we should cross the Michigan Central tracks. It is a board that is composed of the State railroad commissioner, the secretary of state and the attorney general of the State. We were required, in the first instance, to make a map and

89 - 55

a survey of the route. We could not take a step until we did that. The statute provides that our map and survey shall be made and approved by the directors, and certified by the directors, and when that is made, if we cross another railroad, it must be submitted to this State railroad crossing board. When we submitted that to them, the whole subject was before them for decision and determination, whether they would approve of it or not, and if it was not satisfactory to that board, they had the power then to refuse to approve of our map and survey. The controversy was pending in the common council of this city, and the board adjourned to meet here the same night that the common council was to consider it. and the common council also having approved of this location, the State railroad crossing board approved of it, so that we had not only the State authority, but the local authority approving of this route, and that is something that we had to do in order to go on with this enterprise. That is something that we could not avoid. There was no way in which we could file a petition, or take a single step, until we filed a map and survey that had been approved by our own board of directors, that had been approved by the State railroad crossing board, and if we went along a street, it was also

approved by the local authorities of this city.

1207 Now, it has been suggested why didn't we stop right there and get an act through the legislature? In the first place. gentlemen, when this company was organized, the legislature was not in session, and they would not meet again for two years, and this whole enterprise would have to be delayed for that leugth of time, if any such legislation was sought. It was utterly impractical. It was utterly beyond the power of the promoters of this company to accomplish any such thing if they desired to go along with it, but there are other reasons that equally answer that proposition. Those reasons are that it would involve a contest before the legislature of this State, in which every railroad corporation in this State would combine against the Fort Street Union Depot Company to prevent any such legislation, and we have found, gentlemen, in this enterprise, that these corporations have some influence, especially the greatest one in the State, the Michigan Central. Suppose we had gone to Lausing. Brother Dickinson has pointed out that we could not get a bill through just for this case. He is undoubtedly correct in that. We could not have a bill passed authorizing the Fort Street Union Depot Company to condemn a portion of the property of the Michigan Central. It would have to be a general law, authorizing the Fort Street Union Depot Company and other railroad corporations to condemn depot grounds over the rights of way of other railroad companies, under certain circumstances, which would have to be defined in the statute, and that statute would have to have general application all over the State. So that you could not pass such a bill if you tried to, in face of the opposition that would spring up against it, not even if we had a Democratic legislature and Mr. Don M. Dickinson was employed to get the bill through, because it

would antagonize all the railroads in the State if we should 1208 undertake to pass a law, by which, under some local excite-

ment in favor of a new enterprise, the rights of one road could be taken away and given to another. We would introduce an element which would be a dangerous piece of legislation and would produce controversies that would not be wholesome, and

would accomplish no good for the people of this State.

But, as I say, the legislature was two years off. Brother Dickinson may say, Have the governor call a special session. A special session would cost from \$50,000 to \$100,000. It would be unheard of. I merely refer to this to show the practical situation of this enterprise, when it was started, when the men who are interested in it conceived the idea of raising the necessary amount of money and going on with this enterprise in this city. They had to take the laws as they were. They filed their articles of association, in which they designated the places which they were to run to, in which they designated the depot grounds on the corner of Fort and Third, and designated the western terminus of the line of the Backus lumber yard, at the west end of the old union depot grounds. They then made their map and survey, and upon the approval of the State railroad crossing board, and the common council, they proceeded to acquire the land that was located upon the depot grounds and also to acquire the right of way.

Of course they did not make it known in the first instance, in buying property down there, what it was to be used for, and they succeeded in buying some property for what it was worth, getting it at a fair price; other property they were compelled to condemn. In some cases, the verdicts were perfectly just and proper; in other cases,

they were somewhat extravagant, but on the whole, were not substantially out of the way. They have proceeded with it

at any rate. The have proceeded with it in cases in which the learned counsel in this case, Don M. Dickinson, appeared for the respondents, and they acquired, in face of his opposition upon this question of necessity, both upon the union depot grounds and upon the right of way upon River street, they obtained favorable verdicts through juries, fellow-citizens of yours, who have heard the same

testimony and passed upon the same controversy.

They have succeeded in acquiring all of this right of way except two or three parcels, that is the right of way in front of two or three pieces of land, on the north side of River street. They have acquired the entire union depot grounds at the corner of Third street and extending down to Sixth street. They have acquired the entire right of way from there to River street. They have acquired the entire right of way upon the south side, where the property is owned by the Michigan Central. They have acquired the property on the north side, with but few exceptions. They have acquired the property that is beyond Mr. Backus, every foot of it, that is the right of way in front of it, from Twelfth street to the Backus line. in which there were four or five different trials where jurors were impaneled to pass upon the question. We have not acquired the Backus right of way. The next piece of property this way is a small brick house that joins the Backus side track. Mr. Conely is the counsel for Mrs. Specht, who owns it, and he has gone to Europe

with the understanding that the work shall be put up and the damages assessed afterwards. The next property this side is the property of the Michigan Central, where the flour shed is. We have acquired the right of way in front of that. We have ac-

acquired the right of way in front of that. We have ac-1210 quired the right of way across the street from that, all of it, The only cases that are undisposed of is the case of the Penin-

The only cases that are undisposed of is the case of the Peninsular Stove Company, where they have consented that the work be put up, that elevated road be built there before the case shall be tried, so that they will have an actual demonstration of the amount of injury that it will produce upon their property.

But that is a practical concession on their part that they make no contest about the necessity, but merely desire, at the proper time, to have their damages determined by a jury under the constitution and the laws. The only other piece of property that is not condemned is the property of the Diamond Match Company, a great corporation that exists in the State of Illinois and owns this property, which was formerly the property of the Richardson Match Company, but is now the property of the great trust, and that is in process of adjustment, and I apprehend in the end it will not be necessary to try the case, although we cannot tell until we finally reach a settlement of it.

That is the situation of this enterprise. That is what we have done. That is what has been accomplished by the company. There have been all sorts of delays. If anybody had told me when we started out with this enterprise two years ago that I would not be through condemning property by July, 1891, I would have laughed at him; that such a thing was possible to delay it that long I would not have believed. But we had a long controversy with the Michigan Central Railroad Company, which delayed us the principal part of last summer, where they insisted upon very extravagant damages for the privilege of going along the street in front of their property, and we consumed a larger part of last summer, and all in trying that case before three commissioners

1211 in this city. But finally an award was made that was satisfactory to the Fort Street Union Depot Company, and the money was paid. All this money has been paid from time to time as it accrued to the parties. I don't know just what it all has cost, but I know that it has cost a large amount of money, and that money is to be raised by the stockholders in this corporation in some way, and I know that it was estimated at the time, and I doubt very much whether, if they had had any idea as to what it was going to cost, they would have gone into the enterprise at all.

But, gentlemen, it is natural that any great public improvement should meet with opposition. It is natural that men who think, and honestly think that they are going to be seriously damaged, should fight such an enterprise as bitterly and as tenaciously as within their power. They are not to blame for that. Most every one is made up in the same way, and they simply desire to get every dollar they can out of it, and of course they take advantage of every opportunity that they can to get an advantage in favor of their posi-

tion, and they would like nothing better than to have a decision of freeholders in this county that the public necessity does not justify the building of a road along River street. And why? Not that they care specially about it; not that it would make very much difference with their property; not that it would not be a great deal better for them to have it there than to have it anywhere else. That is not the reason. The reason is, that if they obtain such a position, they would be in a position to sell that entire plant to the Fort Street Union Depot Company in order that that company

could get by there, at the price that they saw fit to fix upon it, the extravagant one of \$300,000. That is why they are contesting this question of necessity; that is why they appeal to you to render a decision that would conflict with every decision that has already been made in this matter, that would con-Act with the decision of the supreme court upon a similar case. involving the same enterprise and the same improvement, and that would conflict with the judgment of every disinterested citizen in the city of Detroit. And, gentlemen, it is a little remarkable, as I have already stated to you during the trial of this case, it is a little remarkable that my distinguished friends here should make the arguments that they do in regard to this question of necessity. is a little remarkable that men as learned in the law, men of the reputation of our friends, should come before a jury of their fellowcitizens and undertake to make them believe that it is perfectly easy and proper to condemn a right of way along the margin of the Michigan Central railroad, when every particle of testimony, when everything in the case that is entitled to any weight shows that it is an absolute legal impossibility, under existing laws.

My brother Dickinson yesterday said it was an unheard-of thing to have a lawyer testify before a jury as to what the law is. He saw fit to criticise my conduct of this case, because I had called Mr. Lothrop and had him testify upon that subject; but it is not an uncommon thing, in the administration of the law, to put a lawyer upon the stand to prove what the law is. I remember one time being in court when the late Theodore Romeyn, who had practiced law in the city of New York at one time, and it was necessary to prove what the law in New York was upon a given subject, and as

Mr. Romeyn was then a member of this bar, and had pre1213 viously practiced in the city of New York—had practiced
there some ten or twelve years—he was put upon the stand,
and testified as to what the state of the law was in the city o New
York, because it became material to know it in a controversy that
was in this court.

But, gentlemen of the jury, did it occur to you, did it occur to our distinguished friend here, when he was criticising me he was criticising himself? Did he remember, in his zeal, and in his desire to make a point in favor of his client, did he remember that he was the first man in the case that proved the opinion of members of the bar? I think my brother's recollection is a little short. I think the case had progressed so long that he hardly remembered what he had done himself, because you will remember this, that I

called Mr. Mulliken to testify about the right of way down there, as a railroad man, and as the former manager of the Detroit, Lansing & Northern, and upon cross-examination Brother Dickinson asked him what advice G. V. N. Lothrop had given him upon the subject of condemning the property of the Michigan Central Railroad Company, and got Mr. Mulliken to testify that Mr. Lothrop had advised him that there was no legal objection to it. Don M. Dickinson did that in this case, and he holds up his hands in holy horror later on, and says the attorney for the company in this case has done an unheard-of thing in calling Mr. Lothrop for the purpose of showing just what advice he did give.

Now that there may be no misunderstanding about that, I desire to refer to this testimony, because I think perhaps all of us to some extent have forgotten what took place right here in this court-room.

I read from page 497, the cross-examination of Mr. Mulliken: "Q. Mr. Baker has asked you about legal difficulties; do

you know of any legal difficulties in the way? A. I do not; I am not an attorney. Q. Who is the general counsel of the Detroit, Lansing & Northern? A. Charles B. Lothrop. Q. G. V. N. Lothrop before that? A. He was formerly. Q. That being the best route, was there ever any talk about the power of the railroad company wanting terminal facilities to condemn the Michigan Central's grounds? A. Mr. Lothrop told me at one time there was no difficulty in doing that. Q. Which Lothrop? A. G. V. N. Lothrop."

What did he ask that question for? What did he ask that question for unless he wanted to make you believe that G. V. N. Lothrop advised in accordance with his theory of the law, had given advice that this could be legally done, a man who is well known to all of you, a man who is of the highest reputation in this community, a man who, for the last 25 years, was the recognized leader of the Michigan bar, as long as he was in the practice of his profession, recognized by the bar and the people of the State as at the head of his profession.

Upon redirect examination, as I was somewhat astonished at this

testimony, I put some questions:

"Q. You say G. V. N. Lothrop was counsel for the Detroit, Lansing & Northern; did you get his opinion on the right to condemn a line of road across the Michigan Central? A. He gave me his opinion once. Q. In writing? A. No, sir. Q. How long ago is that? A. I think it was the year before he went to Europe."

He went to Europe in 1885, about the time Mr. Dickinson went

to Washington.

"Q. Where did you see him? A. In his office. Q. Did you go there and ask him for a formal opinion? A. No, sir; we were talking over the general situation of our company with the Michigan Central. Q. Did he make any examination of the subject while you were there? A. No, sir. Q. Did he answer you immediately? A. Yes, sir; that he did not think there would be any reason why the Lansing Company could not condemn the line down the Michigan Central if they wished. Q. Down from where? A. From the junction to Detroit; the right of way over

the Michigan Central, over the Michigan Central grounds. Q. He expressed that opinion to you? A. Yes, sir. Q. Was it without any examination? A. It was without any examination. Mr. Dickinson: That you saw? Q. He answered immediately? A. Yes, sir. Q. Was not that opinion right the other way? A. No, sir. O. Have you talked with Mr. Lothron about it recently? No. Q. Never talked about it since? A. No, sir. Q. Don't you think that opinion was right the other way? A. No, sir. Q. Don't you think that opinion was right the other way?"

That is the way Mr. Mulliken left it at that stage.

Upon cross-examination he testified:

"(). You became the manager of the Detroit, Lansing & Northern how many years ago? A. Fifteen. Q. When you became manager, Mr. Lothrop was counsel? A. Yes, sir. Q. And continued so until he went to Europe in 1885? A. Yes, sir. Q. Mr. Baker has asked you whether he gave it without any examination; was Mr. Lothrop accustomed to give you superficial opinions, in your experience? A. I don't think so. Q. You usually could rely upon his opinion? A. I always found his opinions good."

Mr. Dickinson was throwing that out because he supposed 1216

the opinion was in his favor.

"Q. You found him pretty level-headed ordinarily? A. Yes, sir. Q. When you say he gave it in conversation with you without examination, you mean he did not examine it there and then? A. He did not examine it there and then; he did not examine it, he simply said he did not think there would be any reason why we could not go over the Michigan Central grounds."

And now he lets the cat out of the bag :

"We were talking in regard to legislation necessary to get into Detroit. Q. Did he refer to a piece of legislation? A. No; upon getting legislation, he did not think there would be anything to prevent it. Q. Did he say anything about a piece of legislation passed in 1881? A. I don't think so; that was the Saginaw matter, was it? Q. He thought there would be no difficulty in getting an act under which you could condemn a right of way from the junction? A. That was his opinion. Q. You were not talking about getting depot grounds in the city? A. No, only the right of way. BAKER: Mr. Lothrop didn't tell you you could do that without additional legislation? A. No, sir. Q. Did he tell you if you got a bill passed authorizing it it could be done? A. Yes, sir. Q. You would have to get a bill passed first? A. Yes, sir."

That is the testimony of Mr. Mulliken on the cross-examination of Mr. Dickinson and redirect examination by me in your presence, and it shows that the advice that was given was not in the broad sense in which it was stated by Mr. Mulliken in the first instance, that Mr. Lothrop told him in substance that he thought a bill could

be passed, and that it was necessary to get a bill passed in order to do it, and that they were talking about the legisla-

tion that would be necessary in order to condemn the right of way over the Michigan Central tracks and grounds into this city. And that was all brought out because Mr. Dickinson undertook to

prove in this case that Mr. Lothrop, one of the oldest railroad attorneys in the State, had given advice to sustain his theory. As it appeared under such circumstances, inasmuch as Mr. Lothrop was within easy call, it was proper to bring him before this jury and find out whether he gave any such advice, and what the advice was. We called him, and it being some years ago, he did not remember the particular conversation; he did not remember the year in which it took place, but he goes on and testifies that that was not his opinion of the law at that time, and it was competent to prove that to this jury for the purpose of showing that he gave no such advice, that it could be legally done without additional legislation.

Now my brother I do not think is always entirely frank, not that he intends to mislead the jury with malice aforethought, but that in his zeal he will claim things as having appeared in the testimony, as having been testified to, that he cannot substantiate, and if I understood him correctly yesterday, he claimed that Mr. Lothrop had not testified that it was his opinion that we could not condemn a right of way along the margin of the Michigan Central. That there may be no question about that, I desire to call the attention of the jury to just what Mr. Lothrop did testify to. After testifying to his connection with the profession and his long residence here, I put this question to him:

^{**} Q. Will you state whether, under the statutes as they existed at that time, the Detroit, Lansing & Northern, which was a road 1218 organized under the general railroad law, had any power to

condemn the tracks and depot grounds of the Michigan Central? Mr. Dickinson: To this we object as incompetent. I desire an exception. A. The Detroit, Lansing & Northern was organized under the general railroad law, and I never supposed that they had any legal authority to condemn the depot grounds of any other railroad company whatever. Q. If there had been any such statute in Michigan, you would undoubtedly have been familiar with it? A. I could hardly answer that."

It is modesty, but we all know if there had been any such statute, G. V. N. Lothrop would have been just the man who would have known all about it.

"A. I could hardly answer that; that would go to the extent of my diligence and knowledge, and I would not wish to affirm that I did know it. I ought to have known it."

If he ought to have known it, he did know it.

"Q. Did you ever learn of the existence of any such statute or any such authority in the law? A. I knew that under special circumstances public franchises for one use could be condemned under the authority of the legislature, for another use that was paramount. I knew that, and I have no doubt about it, but I did not know or believe that any authority had been given by the legislature to condemn the Michigan Central property, the depot grounds here. Q. That was your understanding of the law? A. Yes, sir; I supposed it did not exist." That is, the power to condemn.

Upon cross-examination he says:

"Q. Your impressions of the law, which you have stated they were and must have been, prior to the passage of the union depot act, was that the franchise of one corporation could not be 1219 taken without statutory authority by another? A. Yes, sir.

Q. There is no doubt about that at all, but you have no doubt that by express statutory authority, property of one corporation may be taken by another? A. I think I stated before that I always understood that all property was subject to the power of eminent domain, but that there must be, for the particular purpose of taking one piece that had already been appropriated for that use, to take it for another use, there must be express statutory authority."

Upon redirect examination I put this question:

"Q. Suppose it appeared in a condemnation case that was instituted under this statute, that the property was in use and was needed, and there was no contradictory testimony, could a verdict in favor of the necessity and assessing damages be sustained this case? A. All these questions of law I shall have to answer with modesty, because I have been long out of practice, but so far as I remember, I never supposed that property that was in actual use and was needed for the use of one railroad corporation could be condemned and taken by another. I should perhaps make one exception, and that is the crossing of railroads, for which special provision was made by statute. I never supposed it was possible to take land already owned by a railroad company as its depot, and used for that purpose."

Upon recross-examination Mr. Dickinson is trying to get at the

question of the tribunal that was to decide it.

"Q. Of course the question of the actual use and the need, under the question asked you by Mr. Baker, that there was evidence of the use and need by the railroad company whose property was sought to be acquired, that would be a need in good faith; there would not be any pretense about it? A. Certainly not. Q. For the jury? A. The same tribunal that passed upon the other.

1220 Mr. Baker: Suppose the testimony was undisputed that it

was in use and that there was no contradictory testimony, would it be possible, under our laws, for our courts to sustain a verdict in favor of the condemnation? Mr. Charest: By the fact that the Detroit, Lansing & Northern and the Flint & Pere Marquette are leaving the grounds of the Michigan Central without being sent away by the company, does not that show that they do not need all that? A. I should not suppose that that inference could be drawn from that fact alone.

Now, gentlemen of the jury, there can be no question as to what the oldest and most respected member of the profession in this State has said upon that subject. As I understand, one of the last questions that Mr. Dickinson put, he referred to the question of good faith, as to the possession and the need of using a certain piece of property for depot purposes. But that is merely stating it in another way. Of course, if the Michigan Central Railroad Company should acquire a large amount of property that was way beyond

90 - 55

anything that was reasonable for them to own, and acquire it simply for the purpose of keeping it away from other companies, you might conceive of a case where a jury could say that it was not occupied and held in good faith. But, gentlemen, if there was any such evidence to be had, if there was any such evidence that could be used, would we not hear testimony of that kind here? Would we not have some testimony going to show that Mr. Sutherland, whom we called, who is connected with the Michigan Central Railroad Company, was entirely mistaken when he testified that the property was in actual daily use for the Michigan Central road, and the yard was simply overflowing.

and all we would have to do to make that apparent to any man, would be to go down and look at the property, to go down and look at the immense business that railroad company According to the testimony of Mr. Joy, years ago they took their engines and machine shops out of that yard to get more room. They have been enlarging their yard from time to time; not only that, but they have encroached upon River street, and have got 13 or 14 tracks that they use for yard purposes in River street, switching backward and forward daily and nightly, with practically a railroad yard from River street to West Detroit, with four or five or six or eight tracks the whole length, and more business done upon those tracks and upon that yard, I should judge under the testimony in this case, than all the railroad business in the city of Detroit. And still we have a lawyer, learned and distinguished counsel, coming in here and arguing to a jury of his fellow-citizens that they would have a right to decide that we could take that property from the Michigan Central and build an elevated road upon it in spite of them, under an existing statute, which is very carefully drawn and is very explicit, that it cannot be done unless the property is not in actual use and is not needed. That statute does not say or is not needed, and you should remember the full significance of that. Perhaps some of you have got an idea that all that it would be necessary to do would be to show that they could get along without it in some way; but the first condition of the statute is, if it is in actual use, there is no power to condemn it. If it is not in actual use, you cannot even then condemn it, if it is vacant property there, with not a rail upon it or a building or anything upon it; if it was not in actual use in any sense what-

ever, you could not even then condemn it unless you could show that it was not needed in the immediate future for the transaction of the business of that company. And it does not make any difference with us in that form whether you would have framed a law, if you had been the legislature, that would have been more liberal. It does not make any difference what you would like to make the law, if you had the power to make; the law is as it stands upon the statute book, and we and you are powerless to remedy it. The law-making power is vested in the legislature. It is not vested in union depot companies: it is not vested in jurors who are trying union-depot or other condemnation cases.

I think the suggestion of good faith is the suggestion of Judge

Chipman. Realizing, I think, a little more fully than Brother Dickinson, the difficulties attending that, he suggests that you might properly raise an issue in the Michigan Central case as to the good faith of their occupying that land. But I have already pointed out to you that in order to go on with this enterprise at all, we had to take the statute as it is. We had to take the opinion of the State railroad crossing board, and we had to go on under the conditions that existed, and we had no reason to believe, this company had no reason to believe that it was possible for them to acquire a right of way along the property of the Michigan Central railroad, because that company was necessarily antagonistic to this enterprise.

Brother Dickinson undertook to assert the other day that there was some sort of a contract or agreement between these companies, by which they were acting in concert, and he disclaimed any connection with the Michigan Central. But, gentlemen, can't you see;

can't anybody see that the Fort Street Union Depot Company, on the corner of Third street, is going to have a 1223 better location for passenger business in this city than the Michigan Central? Can't you see that when you leave the Russell house or the city hall or the Cadillac or the business portion of this city, that this depot is going to be a better location than the Michigan Central; more convenient and more accessible? and do you suppose there has been a time, from the inception of the enterprise down to the present time, that they would not take the enterprise by the throat and throttle it if they could; and were they not. according to Mr. Dickinson's own story, trying to engage him in that work? But instead of working for them, he has taken up the case of Mr. Backus and some other property-owners, and he says that he did that and refused to take a retainer from the railroad because he did not want to be a railroad attorney; and he undertook yesterday, I think, to reflect upon the testimony or impugn the motives of Mr. Lothrop, because he asserted that he was a railroad attorney from the ground up. Now, Mr. Lothrop has lived here a long time; he has always had the confidence of this community; I think he has had the confidence of his clients generally. He probably has no aspirations to be President of the United States. He has simply practiced his profession to earn what he could in the profession, for the benefit of himself and family. If Mr. Dickinson, as a politician, desires not to act for railroad corporations, it is his right, and it is his privilege; but anybody could see that it would be from prudential, political grounds. As far as I am concerned, I am in the practice of the profession for the purpose of getting a liv-I have no other way of getting a living. Mr. Backus at one ing. time saw fit to employ me in litigations with the union depot

1224 company. I was very glad to work for him. I found him to be a good client. We got along first-rate together. We tried two cases for what they were worth. I endeavored to try them upon their merits. We succeeded reasonably well in that litigation, and our relations have always been friendly. He certainly could not expect me, not having a general retainer from him, to

decline employment that would extend over a period of two or three years to defend one of these cases for him. It is a mere matter of business so far as I am concerned, and while I have the utmost respect for Mr. Backus, and would be glad to serve him in a professional capacity at any time, I was under no legal or moral obligation to refuse the retainers I received from the union depot

company because I had been at one time his attorney.

It will be well enough to understand that there is a great deal of cry about railroads, that there is a good deal of claptrap to it, that there is a good deal of humbuggery about it. One of the things that is done more frequently than perhaps anything else in political conventions or in gatherings of politicians, is to pass a resolution condemning land grants that were made to the Union Pacific and the Northern Pacific Railway Company. It is locking the door after the horse has been stolen. It does not cost anything to pass resolutions of that kind at the present time. It does not oppose any enterprise, and it is awfully cheap. It is easy enough to make a declaration of that kind; but in my judgment, and I am somewhat familiar with the country along the line of the Northern Pacific railroad, it is one of the biggest things that the Government of the United States ever did, to open that whole country up to settlement in some way or other, and it is a fact that you

can buy land today of the Northern Pacific Railway Company, on their grant, at a less expense than you can buy it of Uncle Sam. There are two sides to every controversy. There are two sides to all these questions, and it must be apparent to any man who has a head on his shoulders, that the railroad system of the United States has made this country. What would the United States have amounted to if we had not gone forward in enterprises of this kind? How could the Michigan Central have ever been built and successfully operated, after the State had undertaken to build and run that railroad, and had become utterly bankrupt, if the legislature of this State had not seen fit to pass the charter of 1846, and Mr. Brooks and Mr. Joy had not gone East, and upon their knees implored men to raise the necessary amount of money to consummate the purchase and go on with it, and succeeded the last day of the six months that they were given; an improvement, gentlemen, that marked a new era in the history of Michigan, that built our southern tier of counties, and made the State of Michigan the great, growing and beautiful and wealthy Commonwealth

But one railroad does not make a town. It is a mere start. One railroad does not make a great State. We find that Mr. Joy and Mr. Brooks succeeded in organizing the Michigan Central Company, that they built that road, fought through all difficulties, and they conducted it successfully and satisfactorily for a number of years. But having some foresight as to what can be accomplished in the future, he saw fit, in his management of the road, to encourage collateral lines. We find that he aided in the development of the Detroit, Lansing & Northern, that it was under his manage-

1226 ment that the line from here to Bay City was built. We find that he encouraged these enterprises and aided them, and assisted them, until the stockholders of the Michigan Central became disgusted with him because he was spending too much in railroad improvements and railroad development. They wanted more dividends and less improvements, and finally Mr. Vanderbilt bought the road, and Mr. Joy ceased to be connected with it; but he tells you how along in the early 50's he went over to the city of Chicago, and Chicago was then a smaller place than Detroit then was; he shows you how he aided in the construction of the Chicago, Burlington & Quincy, one of the greatest railroads in the whole Northwest, and how he has been familiar with the railroad business, and has aided and assisted in the development of the railroad business in Chicago, and in this State and in this city, and has ever, gentlemen of the jury, has ever been true to the interests of the city of Detroit.

Some years ago it was thought advisable to bring the Wabash road in here. It was apparently a successful road at that time. It had a terminus at Toledo, and it was proposed to buy the Lake Shore of Mr. Vanderbilt and come up to this city upon that line, but Mr. Vanderbilt would not sell it. He owned two lines down there and would not sell to the Wabash, so it was finally decided to build a branch line in from Butler. They located depot grounds at the foot of Twelfth street, and it was thought that other companies, the Detroit, Lansing & Northern, the Flint & Pere Marquette and the Grand Trunk would come in there, but the Grand Trunk made another deal by which they acquired the D. & M. property, and it was thought impossible on the part of these companies to go on with it, until the Canadian Pacific came along and was

all these years, and if we are to continue on the road to prosperity, we ought to be willing to aid somewhat in the establishment of proper railroad facilities within the city limits. When you come down to the exact situation, it would appear to be quite clear that the proposition to build a railroad along River street to connect with these depot grounds is a sensible, intelligent and proper proposition. If it came through one of our principal streets and would destroy a large amount of residence or business property, there might be some objection, but it goes along a half mile of street, one side of which and a part of the other side is devoted to railroad purposes.

Outside of a few large institutions, the property is in a dilapidated and in a transition state; the property is not property that will be seriously affected in its market value, in its real value, by the construction of this road, and the route that has been selected is simply the most practical, the most sensible and the most proper route that can be picked out between the Twelfth Street yard and the union depot grounds. And I desire, in this connection, before I forget it, to call your attention to this matter of a viaduct for teams, because there is a difficulty in connection with that, that my learned friends do not seem to comprehend entirely, and, perhaps, some of the jury-

men do not see fully the significance of it. The statutes of this State provide, that when, in the judgment of the railroad commissioner the public safety or the public interest requires it, he may order any railroad company, whose track crosses a public highway, to put in a gate and maintain a flagman there, or to put in some sort of an overhead or underneath crossing. It is done in the exercise

of what lawyers call the police power, that is, the governmental power, the power of the legislature to compel the company to do something in the interest of the public safety. That power is carefully limited to the street. The railroad commissioner is authorized to compel the company to put in a crossing, which, of course, must be connected at one side of the crossing with some sort of a superstructure to the other side of the crossing. When we apply to the State railroad crossing board, of which the commissioner of railroads is one, he directed that in building this elevated road along this highway a viaduct be put in there for teams. We contested that, we objected to that, because if the viaduct for teams was put in right in the highway, where it ordinarily would be put in, where it is put in on Jefferson avenue and on Fort street, it would occupy the very space where we desired to build the elevated road. If you made an approach as you approach the Michigan Central crossing and then have a bridge and went down on the other side, which is as you do on Fort street, and occupied the width of the pavement, you would have your highway and your bridge right exactly where we want to put the elevated road; so we contested The Michigan Central urged this, because they thought, perhaps, they could drive us out of the street entirely, that they could get the commissioner to approve of it; but finally the commissioner approved of the map, but ordered that such a viaduct should be put in by the two companies, reserving the right to approve of the plan that they should adopt. So that we were compelled, when we came to build that crossing, to submit the plan to the railroad commissioner, and he approved of the plan, by which we are authorized to build the elevated road along that highway, just as we contemplated, but requiring the two com-

panies to build a viaduct on the south side of it for teams, about from 13 to 15 feet being in the highway on the sidewalk part on the south side, and the other 9 or 10 feet that are necessary, being upon the property of the Michigan Central; the commissioner being authorized to make such an order because the Michigan Central wanted it built, and was more interested in having it built there than they were in the union depot project. It is sensible, then, is it not? Here is your elevated road that will run We had a controversy with the Michigan Central as along there. to whether that would be left open; they wanted to put abutments there. But the commissioner decided that it should be left open, but he also held that the two companies should put in this viaduct on the south side. Now, what sort of condition would that part of the enterprise be in if we went along the margin of this property with the elevated road? Let us see where Mr. Backus would be if we put the elevated road along the margin, taking up 25 or 30 or

40 feet, whatever would be necessary to build the elevated road along the margin, and we put the elevated road where it would have to go, where the commissioner has power to compel them to put it—where he said he would eventually compel the Michigan Central to put it anyhow—put the viaduct for teams in the highway, where it would be necessary, and it would be necessary to make an approach alongside the Michigan Central crossing, and you cannot do that without raising the grade in front of the property of A. Backus, Jr., & Sons the entire distance, and cutting him off entirely, giving substantially the same kind of a structure in front of him there as he has now got on this Fort Street front, where

he testified they have raised it one time and another five or six feet. And still, when we make a fight with the Michigan

Central and insist upon having that highway open, so that he can go across there just the same as he could before, so that the crossing is open for his teams if he desires to go that way, and also affords him another crossing o that if the railroad engines and trains are standing upon the and go up overhead without struction and without difficulty when we make such a fight, a.d obtain such facilities for him, he insists that we shall construct this work in such a way as to block him up there absolutely; and all you have to do is to look at that approach and the situation of that property, to see that what I state to you is absolutely true, as you will find here by this model; that the approach is in front of his property, and if you draw this up further towards the Michigan Central crossing, it would be necessary to have this approach running down on the highway there, so as to cut off his premises entirely. Is it better to elevate the grade there? Is it better to commence on the hill and come up there with this viaduct for teams, or is it better to leave it open so that he can drive in there just as he sees fit, and unload his lumber just as he now unloads it, and go on with his traffic without the least obstruction to his ingress or egress? And the only answer that was heard on the other trial and on this trial to that proposition was to put the viaduct away over beyond, to still go south, if you went along the margin and put the viaduct away over beyond, make a road away over on the Michigan Central property, at right angles, and go over the Michigan Central property in that way. What sort of an interference would that be with the Michigan Central yard? How long do you suppose the Michigan Central people would fight that? How long do you sup-

1231 pose the merchants and people of this city, who desire to do business with the Michigan Central Company, would consent to such an interference to one of their principal means of communication and of business and of traffic? Because there can be no question about the utility of the Michigan Central property and its facilities to the business men and people of this city, and no one who has any regard for his own interest or for the interests of this city would undertake to curtail those facilities. So that when you come to look at this question just as it is, when you come to look at this controversy in all aspects, from every possible standpoint,

there can be but one intelligent answer to the proposition or to the question that is to be submitted to you, as to whether the public necessity justifies the taking of this right of way. We have had jury after jury that have so decided, both in taking the union depot grounds themselves, and in going along the highway, and it is only a matter of time when we will have another jury render a similar verdict, because it is absolutely ridiculous to believe that Mr. Backus and his lawyers have power or influence enough to stop this enterprise. Some one or more of you may think that you are wiser than the legislature, that you would like to change all this, that you would like to take the Michigan Central by the threat and compel them to give up a portion of this property; but it is a herculean task for one or two men to say or to undertake, it is a bigger task than the Fort Street Union Depot Company desires to undertake, it is something beyond any probable or reasonable reach of any man. The company has gone along too far, the enterprise has gone along too far, and necessarily they have not gone along with this enterprise in a blind sort of way, in an ignorant,

stupid sort of a way. Union depots and railroad tracks and 1232 terminal facilities cannot be built without money; the capital has to be raised, the money has to be paid in by the stockholders or borrowed, and this whole enterprise is as sensible and business-like a proposition as has been made in the city of Detroit since I have had the pleasure of residing in this beautiful

city.

We ask nothing unreasonable, we ask nothing unjust. We simply say that this is a practical route, that it is a feasible route, that it does not interfere with the facilities or the ability of the Michigan Central to do a railroad business in this city, and, in addition to that, it does not seriously interfere with Mr. A. Backus, Jr., or any other property-holder on the north side of this street. It is just simply an exaggeration, it is just simply an attempt to get a large sum of money where they are only entitled to a very small sum, where they do not show any desire to accommodate themselves to the existing situation, and to adjust their premises and their business to what is to come. Can you stop this improvement in any such interest?

(Mr. Dickinson here excused himself, explaining that there was a meeting of the citizens' committee at 4 p. m., and he left the

court-room.)

We must all remember that we cannot live in seclusion, we cannot live out on the open plain with nobody around us, unless we want to be a hermit, we cannot live in a great city in that way, and if you live in a great city you will have a neighbor right close to you, his back yard right alongside of yours, and he will have a chimney alongside of yours, and if he burns soft coal at certain seasons of the year you will be annoyed by it; you cannot go anywhere in a thriving, industrious and go ahead population but what

you have got to respect the rights and the situation of others. There is no one who can monopolize the whole thing and say, "My precincts and my property are so sacred

that I shall not submit to any inconvenience and any annoyance in the common good." And I noticed that in these fire returns that Brother Dickinson brought in here, when we came to examine them there were only three or four fires out in the outskirts of the city that had been fired by locomotive engines, and that there was a large number of fires that had been occasioned in this city by smokestacks and chimneys; and if there is any sense in their argument at all, why you should not have a chimney in the city. it might set the adjoining property afire; you should not have any manufacturing institutions, you should not have anything because vou might set A. Backus, Jr., afire. I wonder if he thought that when he built that factory down there and put up that smokestack and made himself a nuisance to Mrs. Barbara Steadley, who owned the adjoining property-residence property there, where the old lady lived for years and insists on living just as long as she has life in her body, because she is attached to the place, where undoubtedly years ago it was a beautiful place to live. We must remember that if this city is to grow and develop, new conditions will arise, and that everybody should go upon the principle that they should live and let live, and when an enterprise of this kind comes along, they ought to be willing to adjust themselves to it and take a reasonable compensation for their real or imaginary wrongs.

What is this elevated road that is to be built there? It does not take an inch of their property. It is to be built so the entire paved portion of the street is to be spanned by this superstructure, with

14 feet in the clear, and it is to run along the highway there, and run along the highway where it would be necessary if

the union depot company had never been dreamed or thought of where it would be necessary in the course of time to put in a viaduct for teams, a bridge just as there is over Fort streets and all the other streets, almost away out to West Detroit; it is a mere matter of time when the public interest would require that such a viaduct should be put in for the safety not only of people that travel in the Michigan Central cars, but for the safety of people who travel along that highway. We are endeavoring to get those put in all around the city, and strong effort is now being made to have a crossing put in on Woodward avenue, and it is expected that it will be accomplished in the near future, and ultimately there will not be a street crossing going out on any street in the city of Detroit, a grade-surface crossing. It is a mere matter of the growth and development of this city, when the public interest and good will require it. Mr. Backus' property is situated so that if this viaduct was ordered in there, it would be necessary to injure his property to some extent by making an approach. That is the difficulty with putting in these crossings. You go out Woodward avenue, and if you put in an overhead crossing for teams, you have to go up there and elevate the grade of the property on each side, and it will do thousands on thousands of dollars' worth of damage, and if you raise the railroad some feet, as it is proposed, and you go under with your passageway for teams, then you will have to make a cutting so that you could not get up to the adjoining 91 - 55

property with a vehicle; you would have to start back and make a cutting so that you could come down and get underneath there, and that would damage the adjacent property, but not so much. So that this is the kind of property, and this is the kind of superstructure that we propose to put up

there. We propose to put up an elevated road that will not 1235 stop their egress and ingress to their premises, where they can carry every load of lumber, where they can take away every load of shavings, every load of sawdust, every lead of any sort of product they see fit to make there, with just the same facility after the road is built as before; and, in addition to that, we will furnish them at the side of the present crossing additional facilities in the shape of an overhead crossing, where they can go when the railroad blocks the street up, as it frequently does. And because we want to do that, Mr. Backus comes in here and claims that you should allow him the entire value of his property, the sum of \$360,000, when he cannot show, and no man can show, that it will have any appreciable effect upon his property. And in aid of such a demand, in settling such a cause, learned lawyers come before you and ask you to find that there is no public necessity for the improvement, and claim that you can make such a decision under a statute, which is explicit that it shall not be done where the property is in actual use and is needed for the purposes of the corporation; and in this connection, in order to give Brother Chipman and Brother Dickinson an opportunity to reply to these cases, and as it will be a matter of some interest to you in your deliberations, I desire to call your attention for a few moments to some of the cases that have been decided, because there is nothing difficult about this question of law, and if there is any confusion about it, I would be very glad to have you request the opinion of the circuit judge, if you desire; yet, if you will take the pains to think about this and reason about it, there is no question about where you will come out about it; it is too plain and too simple; the most learned and brilliant lawvers on God's earth could not convince you that black was white.

They have had a controversy of this kind down in Pittsburgh, and I refer to the case of the Pittsburgh Junction Railway Company's appeal, 122 Penn. State, 511, and I desire to read briefly from this opinion. A railroad company down in Pittsburgh made a map and survey and laid out a railroad through the yard of another company; this company desired to go through the yard of another company; I suppose it was under some such advice as my brother Dickinson has concocted for this case. "In pursuance of this object it surveyed and located a route through the plaintiff's yard, cutting through the coal yard, repair yard, and about 24 feet of the coal chute. Not being able to agree with the plaintiff, the defendant filed its bond in the court below in accordance with the act of assembly. Whereupon the plaintiff filed this bill to restrain defendant from further proceeding to lay its track upon the location in question. The court below granted a preliminary injunction, and upon final hearing made the injunction perpetual."

That is, if we had laid out our road across the Michigan Central track and undertaken to go ahead there, the Michigan Central could file a bill for injunction, just as this company did, and in that case

it would be litigated and settled.

Upon the hearing before the court, it was pointed out that the location did more damage than if they changed it, and the court refers to that: "The master held that such action" (the change in the location) "was justified by a certain statute," that was referred "Upon exceptions to the master's report, the court below held that the act of 1871 had no application, for the reason that it referred to railroad crossings alone, while this was not a case of cross-

ing at all in the proper sense of the term." That is, going through the yard longitudinally was not the case of one 1237 railroad crossing another in the sense in which it is ordi-

narily understood. "In this we think the learned judge was clearly right."

Judge Chipman: We make no claim of that kind, under the crossing provision.

Mr. BAKER: That is, you do not claim that this is a crossing. Judge Chipman: Of course we do not. We never have claimed it. Mr. BAKER: That is undoubtedly true. But I will come to

something else in this opinion soon.

"The act of 1871 relates to crossings of lines of railroads by other There was no attempt here to cross the line of plaintiff's railroads. It was an attempt to run through the plaintiff's yard, and the crossing of some of its yard tracks and switches which were merely incident to the use of its main line. As was well observed by the court below: 'The attempt is not simply to cross the yard and tracks with a common use, but absolutely to take from plaintiff a portion of their yard for the sole use of defendant." And they hold that they would not permit it upon that ground, that it would not be sustained as a crossing, and therefore was defective.

Judge Chipman: We accede to that entirely. There is no such

statute as we have here.

Mr. BAKER: Now I come to the statute part of it.

"We might well stop here and affirm this decree. We are in no doubt, however, as to the main question. While the franchises of a corporation are property, and may be taken under the power of

eminent domain, yet when property has been already taken for one public use by a corporation, it cannot be taken by 1238another corporation for another use, except by express grant or by necessary implication."

Judge CHIPMAN: Yes, sir; that is our doctrine.

Mr. BAKER: "The principle is well settled that the lands or right of way occupied by one railroad company for its corporate purposes, cannot be taken as right of way by another railroad company, except for mere crossings, and then only for crossing purposes, and not for exclusive occupancy."

Judge Chipman: That is our doctrine exactly.

Mr. BAKER: Yes, of course. I will come to you step by step. "It was urged, however, on the part of the defendant that the yard of the plaintiff is larger than is necessary." That is what they claim here, trying to have you believe that the Michigan Central yard is larger than necessary, "and that it could be so rearranged as to accommodate defendant's tracks, and without serious detriment to the plaintiff, either in the present or in the future. The evidence upon this point is conflicting, and we will not discuss it."

* * * "We are not embarrassed with the question that would arise if the defendant company could not build its road without laying its track through the plaintiff's yard. The location claimed for defendant is a matter of economy, not of necessity."

In other words, gentlemen of the jury, the only circumstances under which, in any of the cases we find in the books, one company will be justified in taking the property of another company is where it is absolutely physically impossible to build the road as authorized by the legislature, but if there is any other route between the

two termini that the legislature authorizes the road to be constructed upon, in States where they have a special act

fixing the termini, the only case where there would be a necessary implication that you could take the property of another company would be where, in order to build the road at all, you would have to go right through the property—no way of going round it or at the side of it, or anything of that kind. They say you cannot do it unless there is an express grant or necessary implication.

Judge Chipman: Is there any such statute in Pennsylvania as

there is here?

Mr. Baker: No, there is no such statute. I will come to that statute. You know that statute has been read here time and time again. That statute I pointed out to this jury this afternoon, and it has been argued here from the commencement of this case down to the present time, does not authorize the taking of a right of way over the property of the Michigan Central Company, where, as appears in this case, that property is in use by that company.

Judge Chipman: On that point we contest; but fairness requires you to state to this jury in connection with these cases that there is

no such statute in Pennsylvania.

Mr. BAKER: Certainly.

Judge Chipman: There was no such statute in this case; there is a statute involved there in Pennsylvania about crossings. We have already said that the effect of that statute is exactly as laid down in this law, but they have no such statute in Pennsylvania, and consequently when the Pennsylvania court decide that they could not take this depot, it is because there was no law; that is the reason—there was no statute for it. I notice my friend, Mr. Freud (a juror), shaking his head very approvingly. I wish the jury would put that question, because it is their duty.

1240 Mr. Baker: There is no doubt about that position, Judge Chipman, and I have driven you right where I wanted to drive you, right where the authorities drive you, and where you have got to stand—where Mr. Dickinson has not stood—that you

cannot condemn this land unless you can show a statute, and you cannot show any such a statute authorizing it.

Judge CHIPMAN: That is the very point in issue here.

Mr. BAKER: That is the point in issue; but I want the premises that lead up to that point established beyond question. You make a concession here, but Mr. Dickinson has not made it.

Judge CHIPMAN: That is the point in issue here, whether there is such a statute, and these cases that are being read now have no application to it; they do not touch upon any such state of facts or law as to whether that statute permits us to do that or not. We think that if you are intelligent men, gentlemen of the jury, we can

convince you of that beyond any peradventure.

Mr. Baker: You may try to do that, but unless the jury are color-blind, as suggested, you will not succeed. I have the utmost respect for Judge Chipman, and I desire to pay the utmost respect to him on the trial of this case, but I have argued somewhat from this statute this afternoon, and I desire to establish the proposition beyond any possible question or controversy with every one of the jurymen here, that this property cannot be taken unless there is a statute that authorizes it.

Judge CHIPMAN: That I will agree with you upon, and that case

does not touch the statute at all.

Mr. BAKER: I agree with you upon that.

Now, here is another case I will call your attention to, gentlemen of the jury, Housatonic Railroad Company vs. The Lee & Hudson Railroad Company, 115 Mass., p. 391, where it was claimed that because the legislature authorized by a special act, which is permissible in that State, that a railroad should be built between two towns, and it was practicable to go upon the same route, upon the location of another railroad company, and it was claimed that this implied a right because this other railroad was between these two towns, where they could do it; and this is what the

court says about it:

"No express authority is given in the charter to locate its road within the location of the Stockbridge & Pittsfield Railroad Company, except so far as the third section permits it to enter upon, unite with and use the road of the Stockbridge & Pittsfield Railroad Company at West Stockbridge; nor has any authority been given by the plaintiff, as lessee of the Stockbridge & Pittsfield Railroad Company, to enter upon such location, except as appears by several agreements made between the plaintiff and the defendant, permitting the defendant to do so at certain points on the line of the Stockbridge & Pittsfield Railroad Company. The encroachments complained of are at other points than those authorized by the charter and the agreements. A charter to build and maintain a railroad between certain points, without describing its course and direction, but leaving that to be determined and established by the corporation, as provided by the general laws, does not prima facie give any power to lay out the road over land already devoted to and within the recorded location of another railroad. It is not to be presumed that the legislature intended to allow land thus de-

voted to one public use to be subjected to another, unless the authority is given in express words or by necessary implica-1242 tion; and such implication can only be found in the language of the act or from the application of the act to the subjectmatter, so that the railroad could not be laid, in whole or in part. by reasonable intendment, on any other line. In the defendant's act of incorporation there are no such words, except those already referred to in the third section, and it does not appear that there was any physical necessity that the defendant's location should be made within the location of the Stockbridge & Pittsfield Railroad Company, as appears to have been done in many instances recited in the master's report."

Judge Chipman: There is no such act in controversy there in

Massachusetts as we have here.

Mr. BAKER: There is no question about that, and there is no such act in Michigan as will authorize it.

Judge CHIPMAN: That we will contest to this jury.

Here is a decision by Chief Justice Gray, now one of the justices of the Supreme Court of the United States, in 124 Mass., p. 370

(Boston & Maine R. R. vs. Lowell & Lawrence R. R. Co.);

"The general principle is well settled, and has been applied in a great variety of cases, that land already legally appropriated to a public use is not to be afterwards taken for a like use, unless the intention of the legislature that it should be so taken has been manifested in express terms or by necessary implication."

That is, there must be a plain and unequivocal act of the legislature showing that they intended that one railroad company might

take the property of another.

And then he cites other railroad cases: "For instance, a highway cannot be laid out across a navigable river without the authority of the legislature, and such authority is not to be implied from a general statute empowering courts of sessions

of county commissioners to lay out highways."

A JUROR: That is, you have to show the authority? Mr. Baker: Yes, you have to show the authority. Judge Chipman: That is what we are doing here.

Mr. Baker: Here is another case in 91 N. Y., p. 552 (The Prospect Park & Coney Island R. R. Co., appellant, vs. S. Stryker Wil-

liamson et al., respondents).

The railroad had terminal facilities down on Coney island, and the township authorities down there undertook to lay a highway right through the depot grounds. This is what the court of appeals

say:

'We do not think it is now open to the officials of the town to question, collaterally, in this action, the propriety of the condemnation, on the ground that the land taken was not necessary for railroad purposes, and to appropriate it without any special legislative authority to the purposes of a public highway."

That is, they make the same decision, that there must be special legislative authority in order to interfere with property that is

acquired and used for depot purposes.

"The general principle, that land once taken and appropriated to a public use pursuant to law, under the right of eminent domain, cannot, under general laws and without special authority from the legislature, be appropriated to a different public use, is well established," citing Mills on Eminent Domain.

Here is another case, 30 Minn., 359, The St. Paul Union Depot Company vs. City of St. Paul. The St. Paul Depot Company had a tract of land in St. Paul on which they had a union depot, and the

city of St. Paul, for some reason, thought it would be a good thing to lay out a highway right through it, just the same as if this city would go down to the Michigan Central yard, say at the foot of Eighth street, and lay out a highway right through the heart of River, it would be the same kind of a case; that is what they tried to do in St. Paul. This is what the court

says about it:

"The fact conclusively appears that the land in question is needed and is actually used for a public purpose, authorized by plaintiff's charter. This places plaintiff's rights upon the same footing as if the necessity and propriety of its appropriation had been preliminarily determined by the court or legislature. Plaintiff's beneficial use is practically exclusive, and cannot be appropriated or taken away except by express authority of the legislature or by necessary implication." And they hold that the city of St. Paul had no power to open the highway through the union depot grounds.

I will read to you from another case, in 122 Ill., p. 473 (The Illinois Central R. R. Co. vs. The Chicago, Burlington & Northern

R. R. Co.) The court say:

"The only question which we shall consider is whether the property sought to be condemned is subject to be taken by appellee for the purposes specified in the petition. That the legislature of the State might, subject to the conditions imposed by the constitution, take the property for the purposes in question, we have no doubt. And we think it equally clear that the legislature might, by a general law manifesting such intention, authorize one railroad company to condemn a part of the right of way of another, to the extent and for the uses proposed in this case; but without such legis-

lative authority or enabling act, it is manifest the taking of it would be unauthorized. This is conceded. Such being the case, the question resolves itself into this: Is there any existing legislative authority for taking property, circum-

stanced as this is, for the purposes and in the manner proposed."

And then he reviews the provisions of the general railroad law

in Illinois, and they are substantially like the provisions of the railroad law in Michigan, that there is no general legislative authority in that State.

Judge Chipman: Does he quote any such statute as we have here?

Mr. BAKER: No, sir; they never passed any such statute in that State, and, according to the contention of my brother Chipman, the only question in this case, that he makes continually, is whether this statute authorizes it, and it is too plain for an argument, even with

all my distinguished brother's ingenuity, he cannot show that it can be done under this statute. As a matter of fact, the language of the act is so carefully drawn that the wonder in the case is that Judge Chipman and Mr. Dickinson would ever think of making any such argument before this jury. Does it not say, gentlemen of the jury, in so many words, that the property must not be in use? Let us look at that a minute. We cannot read that too often.

Juror Charest: I took notes of that when you read the law, and after what Mr. Lothrop had said, that one railroad could not take the ground of another railroad for the use of a depot, all for the same purpose. I took notes of the law that you read, that a railroad company could not take the grounds of another railroad com-

pany for the same purpose, for depot purposes.

Mr. BAKER: Or any other purpose. It does not make any 1246 difference what other purpose it is for. It does not make any difference whether they want to use it for a railroad track or depot purposes. All we want up and down there is a right of way to run a railroad, but the question is whether they are using the property, not what use we want to make of it. We might want to put a depot there. Mr. Lothrop did not testify that we could put a railroad there, and could not put a depot there. I will read the statute to you again-sec. 3357. Now, I suppose that the gentlemen upon this jury have the ordinary knowledge that people usually possess of the English language. Here is the statute. Now, remember the position of it. Brother Chipman concedes, and he has to concede, when I cite the decisions of New York, Massachusetts, Pennsylvania, Illinois and Minnesota, three of them are among the best law States in the Union, that is, we get our law from Massachusetts, Pennsylvania and New York, because there has been more litigation in those States than all the other States put together. I guess, so that they are the authority that this State holds to: when I cite all these authorities to them, to avoid the effect of them, Judge Chipman concedes it; so that we start out with the proposition that we have got to go by the statutes, the authority to do this thing, and the only thing they have pointed out is this statute; and assuming that you have the ordinary knowledge of the English language, I would like to read this statute to you. Remember it is a grant. They undertake to give authority, that it cannot be extended by implication, that it must express the authority; it is like a power of attorney that you give a man to sell a horse; it would not authorize him to buy one for you; or a power of attorney to deed one piece of property; it would not authorize him to deed another piece of property or do something else; it is a grant of authority, and it gives just as much

1247 authority as it confers, and nothing else. Now, what is there here? "When any part of the land of any railroad company in this State, in and adjacent to its depot ground,"—well, this property down here is in and adjacent to the grounds of the Michigan Central,—"is not in actual use for depot or other purpose pertaining to the operation of a railroad,"—it cannot be expressed in plainer language; I defy any man to use language that

expresses it plainer than that does,-" is not in actual use for depot or other purpose,"-it does not have to be used for depot necessarily, but if it is in use for any purpose pertaining to the operation of a railroad, a side track, an engine-house, a baggage-house, an elevator, or any other thing that pertains to the operation of a railroad; if it is not in actual use for any such purpose, and if - is not in use, there must be something else; if it is vacant, unoccupied property, then there is another condition; "and such land is not needed by said railroad company for the purposes of a depot or other terminal facilities." If it is not in actual use and is not needed for a depot or other terminal facilities, what can be done? "It shall be lawful for any other railroad company organized as aforesaid, needing such land for the purposes of a depot or terminal facilities,"-it is not limited to a depot-any terminal facilities, a side track, connecting track, or anything of that kind,-" to acquire the same in the same manner as may be now done for such purpose from individuals. The question of actual use and of necessity for the aforesaid purposes by said railroad company owning and not using the land,"-reiterating that-owning and not using it-" shall be determined, in addition to the other questions, as provided by law in cases of condemnation of lands for the purposes aforesaid, and

the same proceedings in all respects, as near as may be, shall be had for the aforesaid purpose as now provided by law where land is acquired for such purpose from individuals."

And Brother Dickinson will read that last clause to you and ask why, if there is a question of necessity and not using the land, why it provides that there is a jury to decide it. It does not say a jury,

but commissioners decide the question.

Judge Chipman: And that needs a jury as well.

Mr. Baker: Undoubtedly; it applies to commissioners if commissioners are appointed; and it applies to a jury, but that is merely providing for a tribunal to decide it, when there is something to be decided, and there can be nothing of that kind, there can be no question of that kind to be decided until you have a case where it is not occupied, and the question comes up whether it is needed or not. I can conceive of a case where there would be a question of whether it was actually occupied, that is, suppose they had a piece of land, they did not have any railroad track upon it, and occasionally they piled freight or something of that kind on it, only used it occasionally, and the petitioning company would come up and say, That is not occupied, you do not use it, and they would come in and say, We do use it; and, of course, that would be a case that would have to be passed upon and decided. But is there any fact or circumstance in this case that would lead you to believe that any . jury that could be impaneled in the State of Michigan would decide that the Michigan Central is not using that property down there; and if you did render any such decision, do you believe that there is a court in Christendom that would allow it to stand? Our courts set aside verdicts every day; the supreme court set aside verdicts and

judgments of the courts below constantly, because there is a lack of evidence upon certain points; and here is the Mich92-55

igan Central using this property every day; that is the testi-mony. You might go down there and say, Well, these cars have been standing there a long time. Of course, they may stand there a day or two, but the testimony is that they are changed every 24 hours, ordinarily. Of course, a car might stand there longer if there was some freight undisposed of, but, every 24 hours, according to the undisputed testimony in this case, those cars are handled along down there along this margin. So that it is in use, and it is in use in good faith. Brother Chipman says he could get up some controversy before some jury about that. Of course, you can claim anything. That thing has been going on ever since Adam, I suppose, that people are claiming something unaccountable and wonderful and mysterious. And there is no accounting for the ability of them to create a controversy; but in the practical affairs of life, in the practical administration of this statute, is it not perfectly plain, is it not just as plain as anything can be, so almighty plain that you cannot argue about it, it is self-evident, it is an axiom, it is so plain that you cannot bring any reason to support it that is so strong as to state it; here is this corporation owning this property down here, the Michigan Central, acquired under their special charter, in daily use, and doing more railroad business than all the other railroads in this city together, and stretching out to West Detroit; and then my friends learned in the law, men supposed to have respect for the intelligence of their fellow-citizens, stand up here and argue and contend and insist that this means something else, and that there is some legerdemain or some hocus-pocus in some way, by which they could get a decision that we could

1250 condemn that property. Suppose there was a question as to whether the Michigan Central really needed that, as to whether they could raise a question of good faith, where would you get your testimony, where could a man come and testify that the Michigan Central did not need it? That is what I would like to

Juror TRAUB: They need it for an elevated road.

Mr. Baker: They do not need it for an elevated road, but they need the ground there; our elevated road has got to be put upon posts, and if that interferes with their tracks, and their right of way is not limited to the surface, they have got a right to put up buildings there; we have no more right to obstruct them there in the air than we have to obstruct them on the ground, and counsel concede that they have got to show some legislative authority for it. Where is the language of this statute which says that we can put an elevated road there, if we cannot put a surface. There is no such distinction.

Judge Chipman: The juror asked you if the Michigan Central would not need it for that purpose; he attempted to aid you.

Mr. Baker: I did not understand him that way. They might want to build a depot there; but at any rate, Brother Chipman and I agree that they have got to find their authority in this statute, and he claims that in some way he has found that authority, and at the proper time we will listen, and I will listen with a great deal of in-

terest to him, because Judge Chipman can think and reason and approach a subject logically, and I would like to see how a man of his calibre and brains can get at this subject and make it intelligible. All I can say is that so far as we have had an argument, Mr. Dick-

inson just asserts the proposition and does not argue it, he just holds up his hand and says, "We have got a jury, we have got a jury to determine this question," and assumes 1251 that because he has got a jury he can get an erroneous decision from them. He does not argue it, but makes a broad assertion of that kind and leaves it there, on the assumption that an assertion of that kind is just as good as so much argument, and that he can lead you to believe that there is something in it; and he appealed to you to disregard the testimony of Mr. Lothrop because he is a railroad lawyer, to disregard anything that I might say in the case, and in the same breath turns around and asks you to believe him, because he appears for the property-owner, and to believe John Logan Chipman because of his services in Congress, because he has made some reputation down there as a statesman and a constitutional lawyer. What they won't resort to in order to bolster up this argument is difficult to divine, and I suppose that tomorrow and the next day we will have to listen to a contention all about the language, all about the legal meaning of those words, when there is not a school-boy in the United States but what could tell you what they mean, when it is so plain that I defy any man to express it in plainer language, to express my construction of that statute in plainer language; I defy any man to express it in plainer words than it is in that very act.

I did not expect that I would talk as long as this in opening this case, but I think that I have sufficiently opened the case, and we will, tomorrow and next day, hear from our learned friends, and with your permission, at the proper time, I will make an effort to reply to such suggestions as they can make; but of course you can realize the importance of this case to my clients, the importance of this case to this enterprise, and will pardon me if I trespass upon

your time more than you think I ought.

Adjourned to Friday, July 10, 2 p. m.

1252

JULY 10, 1891—2 р. m.

Argument of Judge Chipman.

GENTLEMEN OF THE JURY: We have been some time upon this case, and I congratulate you heartily upon the prospect of its conclusion. The positions taken here have been held with great tenacity, and so far, the arguments have been made with a great deal of zeal, and perhaps I am not without that zeal and the attendant excitement myself, but I shall endeavor, as far as possible, to discuss this whole matter calmly, and as nearly as I can with a view of what I believe the law and the facts are. Of course, ultimately, both of these questions must be decided by you, and the most that I can expect to do will be to aid you in coming to a decision. You

have been very patient, and I trust that your patience and good nature will continue until we have got through laying before you our views in the case. So far as my friend Mr. Baker is concerned, I thank him most cordially for the kind and respectful things which he said of me yesterday. We all like to be thought well of, and to be spoken well of. There is a great deal of human nature in that, and I assure him that I value his good opinion very highly. Of course the views which he takes upon this case are diametrically opposed to the views which we take, and in all respect to him, in my judgment, he approaches the case from a wrong standpoint, and in a wrong spirit, in the very inception of his argument and his position here. He seems to think that the controlling right, or a controlling right in matters of this kind rests with the party seeking to procure the condemnation. All his argument has been tinetured with that spirit, and indeed substantially composed of that

1253 view. Under our law, that is radically a wrong view. There is no such presumption, there is no such advantage given to either the State or to a corporation or a municipal authority or other authority when it essays to condemn the land of the citizen. The necessity is never taken for granted. That is always an open question, a question to be determined as well as the question of

damages by a tribunal selected by the parties.

My brother Baker said, with a great deal of emphasis and with a good deal of triumph, that Mr. Dickinson came here and simply says in fact, we have a jury, and that a little eloquence, and substantially, a little fustian will do the whole matter. Now, my friends, that is hardly a proper remark to make. It hardly becomes the exigencies of an action of this kind. I have no doubt that Mr. Dickinson prizes highly the office of the jury in a case of this kind. I know that he is tinctured, saturated with old-fashioned ideas of liberty and of the rights of the citizen, and that he never has been educated into the modern heresy, for it is a heresy if ever heresy existed, that juries are an obsolete institution, and are to be feared instead of being prized and cherished by the community. Of course he says, we have a jury. He demanded a jury, he demanded it because he thought that justice lies in that direction, because he felt sure that you, being men, like the respondents in this case, with similar interests, with the same rights to be guarded, that you would see that justice is done to these respondents, and that the land is not taken without just compensation, that no injury shall be done to any one. And why should we not feel in this way? What is there wrong in demanding a jury here? If it is wrong, the constitution

is wrong, because your constitution provides that we may 1254 have a jury. If it is wrong the statute is wrong. If it is wrong, this whole proceeding here is iniquitous. You know better than that, my friends. The law says we may have a jury, and therefore we have one. We have a jury, because we believe we are safe in the hands of a jury, not that we believe we can dictate to that jury, not that we expect any favors. No, sir, but because we believe there will be a calm, a fair, a jury consideration of this case,

and that the verdict will be honest, unswayed by prejudice or fear

in behalf of either party.

It is wrong in us to demand a jury, is it? And that is made by eminent counsel here as an argument, an argument because he professes to be arguing the case, that is made as an argument here in your ears why Mr. Backus should not stand well before you. friends, what sort of logic is this? Is there any harm in us having you here? Are we wrong in selecting you men, or is the jury system generally an abomination which ought to be abolished? You know it is neither. But why such an argument was made, I cannot conceive, and if it had not been made by counsel so eminent, I should not have mentioned it here. But there was some purpose in the making of it, and whether it will have any effect, I cannot say, but I have confidence in you that an argument which would stultify yourselves, which would degrade you in your office here, which assumes it is wrong in us to appeal to you, that such an argument as that can have no force or effect with so intelligent a body of men. But perhaps he means something more. Perhaps my friend, as the representative of this mighty railroad company, holds it wrong in Mr. Backus to dare to come here and ask you to protect his rights My friend's general argument seems to convey the impression, I do not be-

lieve he feels so himself, but he conveys the idea that a citizen has no rights which a railroad company is bound to respect; 1255

that it is a sort of crime to resist one of these companies when it makes any demand upon the citizens; and yet, my friends, the law says that we may resist them. The law says that we may resist them with reason or without reason; that it may be all fancy that we do not wish to give up our property; that it may be for any cause, and we are not bound to tell you or to tell anybody what our cause is. Under the law all we have to do is to stand upon our land and say, this belongs to us; this is our property; our money has paid for it; the law protects us in it; and if a railroad company wants it they must prove, step by step and inch by inch, the very smallest particle of an inch, that it is necessary that they should have it; and when they have proved that necessity, that they shall pay us the full damage which it is to us. Wrong for Mr. Backus to stand upon the law? What do you stand upon? How do you protect your property? How do you protect your property against depredation, whether from railroad companies or from others? What authorizes you to shut your front door against any intruder? What makes your house your castle, the inviolable abode of yourself and your family? What gives you the right to the clothes you have on, to the food you eat, to any and everything which makes up what we call an estimate as property? It is law. And when one comes to you to take any of these things from you, whether it be a railroad company, or whether it be an individual, you fall back upon the law and you say that this is mine; the law throws its shield around me and says, you cannot have this property unless you get it by due process of law. So it is wrong in Mr. Backus to come here and insist upon his legal rights. It is wrong in

1256 you by the same theory, if a man sues you for a debt that

you do not owe, to say you do not owe it, and to call upon a jury of your countrymen to protect you against his unjust demands. It would be wrong in you, according to that same theory, to protect your store here on Woodward avenue, or your house here on one of the residence streets, if some man claimed title to it, and went into the courts and demanded that title and possession of it from you. A new kind of logic, a new argument in the courts that there is something wrong in a man insisting upon his legal rights; insisting upon his legal rights in this community of law and order, where law is the buttress and defense of all that you have; where there can be no safety, no decency, unless the law subserve, and unless every man is permitted to enjoy that, and that only, which

the law gives to him.

I can hardly think, my friends, that it is right when a citizen comes here in pursuance of the law of the land, and in answer to the demand of a railroad company, or any other company, that he shall be reviled, his motives questioned, his conduct assailed, and he held up as a wrong-doer because he throws himself upon a jury of his countrymen and asks them to protect him in his rights. But, forsooth, my friend depicts Mr. Backus in two attitudes, one standing in the way of public improvement, and the other trying to drive an unconscionable and hard bargain with this railroad company. Mr. Backus is not opposed to public improvements. He is no more opposed to public improvements than you are. No one has put himself in the path of this improvement, if improvement it is. Neither counsel nor client, from the beginning to the end of this proceeding, has uttered one single word against this improvement.

On the contrary, we welcome it. We welcome the union 1257 depot. We welcome any and every enterprise that will add to the wealth of this great and this beautiful city. We are no laggards in this race of improvement. We keep step with the front man in the front rank with everything which will benefit this Her interests are our interests, your interests are our interests. I say we stand shoulder to shoulder in this great march of progress, and welcome everything which brings blessing, brings wealth, brings strength to us, as a community, a people. But Mr. Backus says, Do not make me pay for all of it; do not make me pay the whole bill. If you must have railroads, and they are coming here to benefit everybody in the whole city except him, of what good are those railroads? If this progress is simply a march in which each step treads upon him and crushes him out, and crushed out his business, how can he shout hosannahs to this improvement? How can he spread out both arms and clasp it to his breast and bid it welcome among us. Have it, he says, by all means. Let the good work go on; but, gentlemen, do not make me pay for it: do not let me be the only man in the whole city of Detroit, the only one whom it literally crushes out and ruins in its progress. Backus is reasonable in that. That is the position you would take. My friend talks a great deal about the advance of civilization, and about its being our duty to give and take, as residents of a great community. questionably he is right in that; but, my friends, it must not be all

give and no take. It cannot be possible. It is not just, nay, it would be wicked, iniquitous beyond conception, that any one man should bear the whole burden. If one citizen must bear the burden of introducing this company into the city of Detroit, let all citizens

join with him. If it is proper that Backus should give away
his property and his rights in order to secure this improvement for the benefit of the city, then my friend Baker should
head this jury, head ten or fifteen or twenty thousand of our citizens, and every one of you put your hands in your pockets and say
we will not be liberal at the expense of Mr. Backus, we will pay
in our share and let the company come in. It is wicked, it is unjust, it is illegal to make any one man a sacrifice. There is no law
of the land, there is no law of conscience which calls upon Mr.
Backus to make one single sacrifice in this matter. He can cling
honestly to the last penny of his rights here. That, my friends,
cannot be gainsaid, and that is the feeling you would have, and it
is the feeling which the law permits you to have.

We are not without decisions, for the decisions of our courts, the very gospel of this thing, is that when a company undertakes to condemn a citizen's property, that they shall prove, first, that it is necessary, and, secondly, pay to him every cent that that condemna-

tion costs him.

Now, my friend eulogizes railroads. What has that to do with Mr. Backus' case. I compliment him by saying he did it very nicely. He gave us the history of railroads, their inception and their growth in the world. All that is very pleasant information, perhaps a trifle common; all of that passes as an interesting rhetorical exercise to my friend. But, after all, what has that got to do with this case? Railroads are a benefit. Neither my friend Baker nor myself need say that to you. You are men of the 19th century. You live during the wonderful period when railroads and telegraph and the electric motor have been developed, to the astonishment of the world. You have lived in a period when you are prepared for everything,

when nothing which will come will cause an exclamation of 1259surprise to you. We know that railroads are a benefit; but, my friends, railroads are not so superior a benefit, not so dominant, paramount a benefit that they can be allowed to crush down the citizen and take his property from him without a proper compensation. Railroads are for the people, not the people for the railroads, and when my friend talks about land grants to the Pacific railroads, and about it being mere claptrap for political purposes, I think he has either not studied the question well, or he is mistaken. Take the Pacific railroads, for instance, owing this nation over \$100,000,000, and besieging us at every session of Congress to give them that \$100,000,000. And why do they owe that money to us for the road built upon the lands the Government gave them? My friend says they can sell the land at a less price than the Government can. If I come to your store and steal a watch from you, I can sell that watch cheaper than you can, for you paid for it in your hard-earned money. One hundred million dollars, besides the land grant they owe us, and they won't pay us that, and the

land we gave them to build the road with, my friend says, they are selling for less than \$1 an acre! You get goods in your store and do business on the same basis, and you will be in the position Uncle Sam is in—you will be out so much money and so much land. Why this was brought in here, I do not know, but I suppose it was for some purpose, and therefore I must reply to it.

Now, my friend says that these party platforms are full of fustian on this subject. Was it fustian when under the leadership, or under a bill drawn by my friend who sits there, the och Congress forfeited every acre of unearned land grant in this fair State of Mich-

igan because these railroad companies got these lands and they did not want to pay the price for them; they did not want to do the work, and under that bill, the land grants which were unearned in the upper peninsula were forfeited by Congress, and only the other day, right in the heart of those forfeited lands, forfeited under that very bill, my brother Dickinson and I stood at the county-seat of a new county, found cities all around We found a town of six or seven thousand inhabitants; we found the people coming there and making homes, making fortunes, making strength for their country, and making happiness for themselves and their children. Now, the political platforms that my friend ridicules so much had something to do with that. political platforms demand that justice shall be done, and that is all that they demand. They demand that where these grants have been made, where the homes of the people have been taken from them and monopolized in this way, that if the railroads do not keep their bargain, do not do what the law requires they should do to earn the land, that the land shall be taken from them and shall be returned to the people. Anything wrong about that? I don't know what Mr. Backus has got to do with all this. I don't know what it has got to do with Mr. Backus' planing mill. But somehow or other, my friend seems to think that Mr. Backus is passing all these platforms, that he is pressing this great demand of the people, because political conventions do not put things that people do not demand into their platforms. On the other hand, they put most everything in the platforms that they think the people want. So that my friend, if Le means to arraign Mr. Backus for the conduct of the political conventions and the political platforms, he pays him the highest compliment one man can pay another. I hope Mr. Backus feels that way. I hope he will vote that

nope Mr. Backus feels that way. I hope he will vote that 1261 way. I hope his boys will vote that way. I hope you will vote that way. I hope you will always vote and feel that there should be free land for free men, and that no corporation, no foreign syndicate or domestic corporation shall be allowed to withhold from the people such land, waiting for the rise of prices in the future, barring citizens from having homes in the immense tracts of lands on this continent. But what has all that got to do with this case? What has all this got to do with the necessity of stopping up the streets of the city of Detroit, and how much Mr. Backus should be paid if you find it is necessary? And yet that is a sample of the argument. My friend may have strong arguments

in reserve, but that is the staple of the argument made here yesterday to this jury, the benefits of railroads, the virtues of land grants to railroads, and the sins and iniquities of political conventions.

There is another class of arguments used by my friend, and if that sort of argument finds any lodgment in your minds, we might as well leave the court-room. We might as well have gone in the first place to the company and said, Give us what you please, tear down our building if you want to, banish us from the city of Detroit if you choose, strip us naked and turn us out to the world beggars, if that sort of argument can find any respect at the hands of a jury of our countrymen. But there is another class of argument, and it is this, this work so far has cost the gentlemen that went into it more than they expected, and it is difficult to raise the money, my friend says. What has that to do with Mr. Backus? What has that to do with the necessity of this improvement? Can you explain? Can you show it to me? If this body of men, instead of

being a jury were a charitable establishment, if you were a sort of an alms-house, a poor-house, for Mr. Joy and Mr.

Alger and these other gentlemen whose names have been mentioned here, to take refuge in, that would be a very good argument. But you are not here to financier for them. You are not here to tell them how to get their money. You are not here to help them out if they have undertaken too big a job, are you? You are here to find out whether it is necessary to take River street, and if they do take it, how much damage it is to Mr. Backus. the question the law has given you. That is the question you have solemnly sworn before God to discharge, not whether Mr. Joy has got money enough to pay for what he has undertaken, not whether they have gone to a great deal of expense already. The fact is, my friends, if this matter of expense is of serious consideration with them, they should have waited and condemned all the property and known what it was going to cost before they commenced the work. Difficult to raise money, is it? One of you goes into business, buys a lot of goods in New York. Trade is not so big as you expected it The New York man comes around with your notes. say to him, I made a mistake. The expenses of my business are much greater than I thought they would be. Trade is not so big, rents are high, clerks' wages are high, and therefore, my friends, you must take off something. You must take off ten or fifteen, or twenty or thirty per cent. from this note. If you were the New York man you would pay no attention to it a minute, you would say, you made the bargain, you got my goods. And whether it has cost this company much or little, if they take Mr. Backus' goods, if they take his property, not a right of way only, but his property,

up to the middle of the street, as the courts have decided, if they take that from him, it won't do for them to say the other property cost us too much, they must pay him for what

they take from him.

My friend says they have commenced to work already, they are coming up that street already. They have dug some holes there. You have seen the holes. Take notice, they have done nothing

serious yet; take notice, they have done nothing in the way of a structure that would prevent them going right straight across onto the line of the Michigan Central railroad, but they have dug these holes up and down the street, and he says if you do not find it necessary to use that street, then this enterprise must stop. Is that so? But suppose it must stop. It could not stop. You know it would not We all know it would not stop. But suppose the worst comes to the worst, is that any reason why Mr. Backus should be injured and plundered? Will their carrying on their project make him whole? Would your sympathy for them, because they have got themselves into a bad scrape, would your sympathy for them be justice to him? Now, my friends, that is not a proper argument to address to a jury. I repeat, and I cannot repeat it too often, we are not here to determine whether the railroad company are making a good or a bad bargain, whether they can go ahead with their project or not go ahead with their project, but we are here to determine whether it is necessary to use that street, and whether if it is necessary it injures Mr. Backus, and if so, how much? There is the question for this jury, and everything else, every consideration which does not touch those two questions has no earthly place in this case. Suppose, my friends, that they have commenced their work. Does that make Mr. Backus' property any less valuable? The property is there, the work is going - in front of it. Does

that change the question as to the necessity of using this street? Does it bear upon it at all, and can my friend expect it to have any place here, except as a mere appeal, a mere begging to help them out of the scrape in which, according to his story, they have brought themselves, but which I do not believe they have got themselves into at all? Do you believe that Mr. Joy, with all his experience in railroad-building, did not know that every man whose property he injured would make him pay for it? Do you believe that Mr. Joy does not understand the arts and the measures by which rights of way are fought through? Does he not know that the weak fall by the wayside, and those who cannot come into a court and before a jury, and have not the means to face these companies, give way, and take a paltry ten dollars here and five dollars there, and do almost anything to avoid trouble? It is not surprising that they give you the list of the widows and the orphans who took what they chose to give them, this widow, and this estate, the guardian may have bargained with him. The widow and the orphan could not come here. They have not got the power and the strength to stand up and fight Mr. Joy and the union depot company. We are told that because all this has happened, Backus is a bad citizen because he dares to fight and because he dares to ask at the hands of this jury that which belongs to him.

Now, my friend calls upon the council. The common council have indorsed the work of my friend. In view of recent events in this city, I hardly expected my friend to invoke the name of the common council in connection with this corporation. I hardly expected that argument to be made here. It seems the common council have let this company do about as they pleased, let them

take a street down there. And it is a very serious thing to take a public street. They give them authority to close street 1265 after street, or are about to give it. Are you in a frame of mind to allow the action of the common council to be cited here as a reason why Mr. Backus should not be paid for his property, or as a reason why the railroads should go up that street at all? Do you feel as if my friend were appealing to highest authority when he bid you turn your eyes to the other end of this building and behold all the virtues assembled there? Now, my friends, that is fustian. The council had nothing to do with this question of necessity; they had nothing to do with the question of damages. If they had to do with those questions, why are you here? What are you brought here for? First, my friend says, the railroad crossing board has settled this matter. Then he says the common council have settled Then he says the company have settled it themselves by digging some holes in the street. What are you here for?

Mr. Dickinson: They filed plans.

Mr. Chipman: I am coming to that. What are you here for? What office are you to perform here? What does the law say? The common council, railroad commissioners, railroad companies cannot touch an inch of the property until you find this necessity and until you have awarded damages.

Mr. Dickinson: Neither can the legislature of the State.

Mr. Chipman: No, sir; on that I shall speak to you in a few minutes. Now, my friends, what sort of an argument is this? Does it affect you? As sensible men, does any such argument force you to believe that you are here for nothing, except to look as pretty as

you can and sit in your chairs and go to sleep while we are making the speeches, because that is all there would be in it

if the common council and the railroad commission and the company have decided it? That is all there is left in it, and there is nothing left for you but to drone and to drowse away your time and get through with it as quickly and as safely as you can. You know better than that. You are here to perform a high and an important function, a duty cast upon you by the law, a duty formerly performed by the legislature, the highest body in our State; but when the people framed a constitution, in that organic law, they took the power from the legislature, they would not trust the legislature, and they said the citizens must decide all these matters. Although they would not trust the legislature, the counsel tries in some way to make you believe they trust the common council of the city of Detroit, and that the action of that body is final in the premises.

Now, my friends, it has pleased Mr. Baker to couple this statement, about the omnipotence of the common council and the power of the common council, with the assertion that this railroad does not take an inch of the property belonging to Mr. Backus. Why does it not take an inch? Mr. Backus is the owner of that property to the middle of the street. The public have a right of way over it, but Mr. Backus is the owner of that property from the middle of the street clear up to the heavens. That is the law. You cannot

build a house in front of it. You cannot shut out his light. You cannot put any permanent structure in front of it without being guilty of a nuisance, without being guilty of a trespass upon it. There is no doubt about that. Every man understands that. No man is fit to be a citizen who does not understand it. Let some

man come and put a structure in front of your house, how quickly you would drive him away. The city might drive him away as obstructing the right of way of the people, but if the city did not act you could act. Suppose a man should erect a low building four feet high, for some purpose or other, between you and the middle of the street, you could drive him away.

Mr. Dickinson: Or put it upon stilts so that he could drive under. Mr. Chipman: Or put it on stilts so that he could drive under, exactly as they propose to do with this elevated road. You could defend your rights there. The city, generally, or the county, generally, might prosecute for a nuisance, but you, specially and particularly, you of all men alone, would have an individual right of action as against the person who committed this trespass. Why? Because, up to the center of the street, subject to the easement and right of way of the public, that property is yours. No man can take it or appropriate it unless in accordance with the law of the land.

In the case of Lahr vs. The Metropolitan Railroad Company, 104 New York, the court, in giving their opinion, review some decisions which had been previously made. Before I read that, however, I will read what our own supreme court says in the case of The Detroit City Railway against Mills, Northwestern Reporter of June 21. This case, in brief, is this: Here is a land-owner upon a lot abutting upon a street. Mr. Backus abuts upon this street. The soil he owns, that is the soil in the street, not a right of way, but he owns the fee, subject only to a public easement, which he, by dedication or otherwise, has granted to the ordinary and proper uses of

the street or highway. Backus abuts on the street. Justice
1268 McGrath, in the same case, in giving his opinion, quoting
from that great jurist, so many years on the bench of this
State, Judge Christiancy, indorses the doctrine laid down by Judge
Christiancy in Booming Company vs. Jarvis, 30th Mich., 319, as follows:

"It is a transparent fallacy to say that this is not a taking of his property because the land itself is not taken and he utterly excluded from it, and because the title nominally still remains in him and he is merely deprived of its beneficial use, which is not the property but simply an incident of property. Such a proposition, though in some instances something very like it has been sanctioned by courts, cannot be rendered sound, nor even respectful, by the authority of great names."

That is, that the word and authority of great men cannot make any such doctrine respectable, that when you take this right of way in front of Backus, you do not take his property. Here our judges say, three at least of our judges say it here, of your own court, and the judges of other courts say it. What is Mr. Backus here for at all? Why is be here if they are not taking something from him which belongs to him? They are not paying for oubbles in the air. They are not paying for his whims and caprices, but this is property; and being property, the law says you cannot have it unless you show a public necessity, and then you must pay for it to the value of it.

My friend will have to change his position. He says not an inch of his property is taken. What is it? What are you doing with the man here? What is he here for? Why are you here? Why all this expense, all this testimony, all this loss of time, if nothing

is to be taken from Backus? The courts say that under 1269 these very circumstances, where you take to the center of the street, taking what is called the right of way, that you do take the man's property. It is his property, you are taking it from him, and you must do it only under a public necessity, and then

you must pay him all that it is worth.

There is some very good doctrine in this case of Lahr. In the State of New York formerly, when these elevated roads were put there, they held that they were to be treated, as it were, as a sort of nuisance, and that the only remedy against them was to sue for the rent or the diminution which was caused by the occupation of the premises. That doctrine prevailed until finally, in this case of Lahr, they held that the taking of a street in front of a man's premises in that way was really an injury to the fee, and that consequently he was entitled to damages, and could recover damages for that injury. In that case the courts say:

"We hold that the Story case has definitely determined, first, that an elevated railroad, in the streets of the city, operated by steam power, and constructed as to form, equipments and dimensions like that described in the Story case, is a perversion of the use of the street from the purposes originally designed for it, and is a use which neither the city authorities nor the legislature can legalize nor sanction, without providing compensation for the injury inflicted

upon the property of abutting owners."

What becomes of your common council under that decision? According to my friend's argument, they have settled the whole question. But this court says, that even so great a body as that, and that even the greater body of the State itself cannot do this

thing.

"Second, that abutters upon a public street, claiming title to their premises by grant from the municipal authorities, which contains a covenant that a street to be laid out in front of said property shall forever thereafter continue for the free and common passage of and as public streets and ways for the inhabitants for said city, and all others passing and returning through or by the same, in like manner as the other streets of the same city now or lawfully ought to be, acquire an easement in the bed of the street for ingress and egress to and from their premises, and also for the free and uninterrupted passage and circulation of light and

air through and over such street for the benefit of property situated thereon.

"Third, that the ownership of such easement is an interest in real estate, constituting property within the meaning of that term as used in the constitution of the State, and requires compensation to be made therefor before it can be lawfully taken from its owner

for public use.

" Fourth, that the erection of an elevated railroad, the use of which is intended to be permanent, in a street, and upon which cars are propelled by steam engines, generating gas, steam and smoke, and distributing in the air cinders, dust and ashes, and other noxious and deleterious substances, and interrupting the free passage of light and of air to and from adjoining premises, constitutes a taking of the easement, and its appropriation by the railroad corporation, rendering it liable to the abutters for the damage occasioned by said taking."

Now, Mr. Backus is an abutter there. His premises run up to the That street is one of the oldest streets in the city of Detroit, laid out years and years ago, laid out in the early days of the Territory. It has been a road from time immemorial. Down that street

marched the troops who went to the Raisin. Up that street 1271 marched the British at the time of Hull's surrender. My friend Rivard's ancestors were there. He probably knows something about the history of that street. There that street has been from time immemorial. Every man bought his property subject to that right, and every man who buys there, just as any of you who have bought on Woodward avenue or Jefferson avenue, has that right, and railroad companies, city councils nor no one else can take the right from you.

Now it is idle to say that Mr. Backus is not to be injured here. It is idle to say that he has no substantial claim here. The law says he has a claim. The railroad company itself says he has a claim, because it comes in here and makes him a party and wishes to acquire the rights which he possesses there, for the purpose of

building this road.

Now, among the arguments which my friend has made here, and it is a sort of kaleidoscope, and they are different every time he turns his machine around and it takes a new shape. He says that by and by Backus will be blockaded anyway. There is a good old saying, "Sufficient unto the day is the evil thereof." You are not here to decide what the railroad commissioners or the city of Detroit or somebody else will do to Backus 20 or 30 years from now. You are not here to imagine what will happen. You are here simply to do what is patent to your eyes and your ears, to apply your understanding to today and not to tomorrow. What does Backus care what takes place when he is dead and gone? What difference does it make to him what becomes of that property when he is in his grave, and when all the property he possesses will be his chance of a happy hereafter? You see, my friends, you are dealing with today. You are not seers, you are not proph-

ets, you are not speculators, you are plain, every-day matterof-fact jurymen, dealing with the present, with now, dealing with Backus' mill, as it is situated, dealing with Backus under the rights he possesses now-dealing with this question of necessity and this question of damage, with this question of what is sought to be taken by this railroad company. How my friend makes out that it is possible in any way to crowd Backus out by anything that should be done with regard to conditions which are not there now, I cannot conceive. The railroad commissioners apparently have acted. They have established gates here. They have established watchmen there at the central crossing. And besides, my friends, the crossing and the opening which Mr. Backus relies on principally is by way of Twelfth street. That is the crossing they are trying to cut him off from. Do you think that is a fair thing for you to do, when you are here to take things as they exist now, to get some imagination into your heads that something else will happen by and by? Is that honest? Can you, as honest men, doing your duty, can you, under the oath to do justice in this case, take any such view as that, and say to a man, They have injured you, but they are not going to give you anything, we will decide against you, because in ten or fifteen or twenty years from now, somebody will come along and close you up? It is a shame to make such an argument. It is not just, and if you are influenced by any such consideration, you certainly will fail in the performance of the high duty you have undertaken to perform in this matter.

I dwell on these things because my brother has deemed it proper to introduce them to the jury. Ordinarily I would not dream for an instant, that any such considerations could enter the heads of

honest and sensible men.

Another argument that is made against Mr. Backus is that he wants his pay. Backus wants pay. Now, Mr. Backus has always said, Go ahead with your railroad; take it away from me, take it across the street; I do not want to be paid; let me Go across the street with your road, then you will have no controversy with Backus whatever. But he certainly does say that if the jury finds it necessary that this railroad should plant itself right in front of his doors, that he wants pay, and therefore Mr. Backus is a very wicked man. How, wanting pay for his property, wanting damages, he can sit there, apparently sleeping the sleep of the just, his conscience apparently not affecting him, under the scoriation my friend Baker has given him, I cannot imagine. You would think his guilty conscience would keep him awake nights, if there is anything so awfully wrong in wanting pay for the injury done to him. He does not look like a very bad man. He does not look like a man who has got any guilty secret upon his mind. I think on the witness-stand he looked my friend Baker in the face calmly, and he talked low and talked quietly in response to my friend's somewhat loud and violent tones. He does not seem to feel that he is doing anything wicked here, and do you think he is, my friends; is he doing anything wicked? The law says he may do it.

What makes it wicked? Is he driving an unconscionable bargain? What makes him wicked? Is it because a railroad company wants this property? Why, I tell you, my friends, it is wrong, it is a shame that when a man comes in to assert his constitutional rights, when he simply asks of the jury that which the law says is his own, when he does it decently, without chicanery, without attempt at corruption, without attempt at perjury or any form of untruthfulness, I say it is a shame that he should be villified and

abused as if he were a common malefactor and ought to be put in yonder dock and bid to stand up and answer guilty or not guilty to some charge of crime. Is that the way to treat a man who asks only for his right under the law? Is that the way to characterize his actions when he says to you, All I want is what is fair and right here, and I will leave it to you to determine. Gentlemen, this sort of ground and lofty tumbling won't do. Even railroad companies must abstain from that sort of abuse of people who choose to come here and insist upon their rights.

Mr. Dickinson: Brought here in spite of themselves.

Mr. CHIPMAN: Backus did not come here and ask anything from the company. He has not brought the company here. The company has brought him here, brought him here and made him plunge into the law, just as you do a boy and plunge him into the river and teach him how to swim and say, Strike out and save yourself. Their summons brought him here, and yet he is wrong because he came; he is wrong, because when he does come, he stands upon his rights; he is wrong to leave his business here and ask you to accord his rights to him. I say that is not the spirit in which to try a matter of this kind. It is too high-handed. Even a great corporation is not justified in treating a decent citizen and propertyholder of this city in any such way as that. Is there anything wrong about Backus? Decide that now. You have heard this harangue about him. Is there anything wrong about Backus? Do you think he is a guilty man? Do you think he is a wicked man? Do you think he is a bad citizen? If you do not, discard all this abuse and simply come back to the question in the case, whether this is a public necessity which justifies this company in using that street, and whether if that necessity exist, it affects Backus, and how much the damages are.

Now, gentlemen, we have had a great deal of talk in this case about what is called the right of eminent domain. There has been a great deal of talk here as to what that right is, what it applies to. Intrinsically it is a very simple matter. You see an illustration of it here. It is under the right of what is called eminent domain that this railroad company comes into this court, and seeks to condemn the property of your fellow-citizens. It is simply the right which resides in all governments to appropriate private property for paramount public uses, public uses which are paramount to the private use, which are of a stronger and more general necessity than any private use to which the property is devoted. In other words, the interest must be of so general and public a nature as to justify the taking of the property. That

is what is called the right of eminent domain, and that right and the power which we may exercise under it extends to every species of property. There is not one law upon that subject for you and another for a corporation. There is not one law upon that subject for the small and another for the great. The law is universal, that where a public necessity requires a use of private property, that that public necessity is of such a character that the private use of the property must give way, and whether it is over the tracks of the Michigan Central railroad, whether it is through your door yard, whether it is in front of Mr. Backus' mill, wherever this public necessity comes in, the right of eminent domain which resides in the State will come in and take possession of the subject and dispose of it. Now, there are some things in this world I observe that mys-

teries are made of, and you hardly ever find a man for interies are made of, and you hardly ever

Mill, and Adam Smith, men who make little money, and the men who are always looking out to make the next dollar, their vision is always too limited, their necessities, their desires always prevent them from taking a great, broad view, who can lay down a general law. And so it is in some respects in regard to these corporations railroad corporations. They assume a great deal of dignity and a great deal of mystery, and a great deal of sanctity, giving a sort of idea that they are not made of the same clay that you and I are made of; but when you come to think of it-now here is Mr. Joy, a gentleman I respect very highly, a man who, intellectually and physically is in some respects very remarkable. You have all heard of Mr. Joy. He is a great railroad man. He is the incarnation, so to speak, of the railroad idea. You saw him sitting there, you observed that he is a man like other men, that in the progress of years his hair has turned gray, his face is wrinkled, he begins to shrink just as other men do, from his stature, though his vigor is remarkable for his years. You have learned that he wears the same clothes, probably a little nicer than some, not as nice as others. He feels the heat and cold just as you and I do. I have no doubt he has the same necessity to eat a square meal three times a day that you and I have, and to go through the other functions of the body which you and I are obliged to go through with.

Why do I say this? Simply to let you understand that 1277 he is like yourself and myself trying to take care of yourself and myself; and when he comes here with an enterprise that his money is in, that his fortune is in, that all he has made money largely out of, as you can see, when he comes here and talks in the name of the public, appearing as a disinterested benefactor of the city of Detroit, you want to say, Mr. Joy, you are a man, your hair has turned gray and you eat and you get cold and warm, and you are a man in all respects like the rest of us, you have to take care of Mr. Joy, you do take care of Mr. Joy, you are not a god, you are

94 - 55

not so high up that your desires to make money out of this road. this project, will not color your testimony and color your feelings upon this subject. Why, my friends, there are men, and you know it and I know it, and we see it, who will give their hearts and homes and carry ruin and misery with them in all directions to carry out a project of this kind. Take that elevated road in New York. See what ruin that has created to that city, and thatched today with judgments which it does not pay, on account of the immense mortgage which lies over it, preventing anybody from buying it on a sale. I am told that one of the greatest stockholders in the company, the immaculate Russell Sage, is buying up all the judgments, on a great discount on the dollar, and undoubtedly he and Mr. Gould will soon freeze their brother stockholders out, and somehow or other get the whole thing in their hands. Now, my friends, Russell Sage teaches a class in Sunday school. He is one of the pillars in a great church. He is a teacher of little boys, and he is very careful not to give them any pointers on stock, and he is very careful not to pay the fathers and mothers of those boys the money he owes them

for damaging their property. Russell Sage, and these other gentlemen engaged in the Wabash road down here, undoubtedly would go into this witness-box and look as saintly and as good as good could be, and tell you that you should give them this property for the sake of the public improvement and for the

sake of the best interests of the city of Detroit.

Now, I repeat to you that I have nothing but respectful words to say of Mr. Joy personally. I will not stand here or anywhere and speak unkindly of a man whom I do not feel unkindly to. I am not talking of Mr. Joy. When I talk of him, I pay him the greatest compliment that I can pay any man, and say he is a man like the rest of us; but I am talking of the railroad director, of a man whom in my judgment is almost a monomaniac on the subject of railways, a man who has worked himself into the belief that every time he has a project, it is for the good of the community, and it therefore should be paid for by somebody else. At any rate he has that belief, and he tells you these elevated structures are no nuisance. that they are not in the way of anybody. Now, I have been in New York a great deal, and some of you have been in New York a great deal. Before I ever dreamed of any such project as this, before I ever heard of any such thing, in New York, talking with New York people on the streets, where these roads were, time and time again, I have said in my opinion, that they were one of the most fearful nuisances that were perpetrated on the people. Street after street was ruined, and any man who has been there knows that they are ruined, by these roads, and clear to the upper end of the island, the railroad going up over the roofs as it were, where they go up from the first-story window clear to the fifth and sixth, where you can look into everybody's window and see women dressed and undressed, where you have got to keep

1279 your house shut to keep it from being the worst kind of a public nuisance; that they make smoke, that they make dust, and that they obscure the light, that they are dropping from

under the tracks, and any man who has been there and has seen them knows - to be the fact. You take this Twenty-third Street, or Sixth Avenue road. Take this Twenty-third Street and Sixth Avenue road; I had a room on that corner, one of the greatest thoroughfares in New York, pretty near as great as the corner of Broadway by the Fifth Avenue hotel; any man who has been there knows that corner is drenched with oil and with drippings from the trains day and night; you can see it there, grease all along there; that is one of the funniest specimens of street railways in New York; that is generally a choice specimen for those who turn to it and say, There is an elevated road that has not injured the street. It has injured the street, and when you come to a narrow street it has ruined it. Who wants to do business in this world in darkness, in this dirt, with the fresh air shut out, with the smoke and cinders coming in, obliged to use artificial light? wishes to do business in that way? And of course the better class of business people will not do business in that way. I can point you out places where the elevated road is perhaps a benefit. You may take a place that touches the corner of Twenty-third street and Sixth avenue, where the elevator comes down; there is one store on that corner, and right across the street there is one big eating-house, which is benefited on account of the crowd that comes there; but outside of that no one is benefited; that is on account of the elevator where crowds rush to go up and down, and in that way that locality is benefited; but as it shrieks on until you

get to the next elevator, every bit of property is hurt by it, and all the more hurt because people will not come in, who want to go to the next elevator, in the place between, they go to the station, so that the places right next to the station are helped, perhaps, by the great crowd which the stations bring; but the very purpose of bringing these great crowds to the stations takes them away from the other property, and in that respect is a damage and injury to the other property; and every New York man will tell you that. That is a great argument in favor of the roads, and the only argument they make in favor of the roads. In the streets through which they go, the men next to the stations say they are benefited, and that their benefit is to other people's injury. In the country, up beyond Central park, up at Harlem and all through there, those are the people who are benefited, and in the same way this elevated road may be a great benefit to people who want to go to the depot on Third street and on Fourth street, but at the same time it is a tremendous injury to Mr. Backus.

Your duty in these cases has been read to you and commented on by my friend and associate, Mr. Dickinson, in the opening of the case, but it is very well that you should understand what your duty is. I do not want you to magnify your duty. I have no desire to invite you to assume any office which is not yours, but I think it is a matter of great importance that you should know exactly what your duty is; a man at all times and all places should know what his duty is; you are expected to perform it, and the first step towards a proper performance of it is to know it

What is your power? What are you here for? Is this a question of the general effect of the union depot upon the prosperity of Detroit? No. The law has not confided any such duty as that to you. The duty confided to you, and you swear that you will perform it, is to ascertain whether it is necessary to use this portion of the street, and to assess the damages if necessary-whether the public necessity requires this or that street. Nobody doubts that it is a good thing to have a depot at the corner of Third street, nobody contests that question, and if that question is in issue in this case—the law does not put it in issue, it has no business here, it is an intruder, a usurpation, a wrong to my client. That depot may be a magnificent thing, and is, and yet there may be a better way of getting to it, and if there is a better way, then under the law and under the decisions of our court, Mr. Backus may urge that they should take that way. There is nothing wrong about his doing that, is there? The law says he may do it. Poor Backus does not know whether he is right or wrong since he has got into this thing. Is there any harm in his doing that? The law says he may. Now, why should he not do it? They brought him here to try an issue; he is down there attending to his mill, getting out his boxes and his lumber, and shipping them off, attending to his general business in his mill and seeing that his men are at work, and that the 134 people he employs there have their There he is in perfect quiet. He has nothing against the union depot; but they send a little paper or notice to him and say. "We want to do so and so to you, come up here," and poor Backus comes and here he is, and he says, "I don't think it is necessary for you to do that, there is a better way for you to do that, you can go across the road;" and what do they say in reference to him? They say Mr. Backus is a very bad fellow for standing in the way

of public improvement; they say, you ought not to do that, Backus, you are wicked and wrong, You should lay down here and let us do what we please about this. But poor Backus has an old-fashioned idea that there is nothing wrong in making objection under the law, and he says, I am brought here to try the question of the necessity of using that street; I do not think it is necessary; I think you can do another thing, and this is what we are trying here; and he is told at once that he wants to make an immense sum of money. He has the right to make an immense sum of money if the case justifies it. But he is told at once that he is here for that purpose, to levy tribute on this company. But he says, Take it across the road, then you will not have me in your way, and you won't be in my way, and you will have no necessity to bring me before a jury, and you and the Michigan Central Railroad Company can fight it out between you. And yet for all this he is told that he is wrong. And yet we ask, would it not be the better way to go along the old depot ground up to Twelfth street and cross right over and continue along the margin of the Michigan Central up to Seventh or Eighth street there, and then cross over where they are already prepared to cross over, and get onto Fort street that way. Oh, yes, that would be a better way, nobody denies that; they cannot deny that as long as they have eyes in their heads; you all see that, you all know it would be a better way for the company, and you all know it would save the public highway and save the cutting off of many streets there; at any rate, it would save the cutting off of River street. They do not deny that. Mr. Joy does not deny that that would be a better way. We have not a person in this case who denies that it would be a better way. Then, we ask, why do you not do it, why not go there?

Oh, we cannot; but, we reply, you can. Here is a law Mr. Joy passed at the very same session as the union depot act, under which, we say, you can do this very thing. But we cannot do it under that. Did you not draw that act, Mr. Joy? And notice, gentlemen of the jury, every time he has been upon the stand he will not tell you whether he drew that or not. He says he does not remember. He says he might have drawn it, that it may have been his. And yet it was passed at the same session of the legislature, passed on the same subject, and no one can point to any one else who had any occasion in the State of Michigan to carry out the purposes of that act, to take the depot grounds of any other depot company. Now, that act was passed for some purpose, and yet, according to Mr. Joy, it is utterly purposeless, it is no use in the world here; and Mr. Baker can only conceive of one condition of things under which it could be applicable anywhere. I was glad that he conceded it that. Let us look at the facts. What has been done? They say you cannot do a certain thing; but I say it has been done already. They say you cannot take those depot grounds, or part of those depot grounds; and yet you know they have taken the corner of them already, they have taken the corner down to Twelfth street, and run an elevated track across there. How did they do it? How was that brought about? They say it cannot be done, but it is done. They say you cannot interfere with the property which the company has got for depot purposes, and yet they have condemned Twelfth street clear up to Seventh, the whole right of way, the whole easement in the street, properly belonging to that company for depot purposes, paying \$39,000 for it. But above and beyond that, while they say they cannot get a margin for an ele-

How was that done? By what process was it brought about? The railroad commissioner, forsooth! Can a railroad commissioner take your property, or any man's property, or a company's property, and make them do with it what they do not want to do? How can he do it? The Michigan Central railroad knows just as well as I know, and as you know, that there is no power to condemn that property. The mere ipse dixit of any officer of the State could not take it away from you. The railroad commissioner may have ordered bridges there over the crossing; he may have ordered them to be risen or to be sunk; he may have ordered guards there, but there is no authority under the statute for him to go out of the

street; and my friend, Mr. Baker, in his speech yesterday said to you that it was confined to the street, confined to the crossway of

vated road, they have got 1,500 feet of viaduct upon that

the street. Understand that this is not a crossing, it is a viaduct 1,500 feet long, 24 feet wide—not 24 feet, but lapsing over 19 feet onto the Central Railroad Company's property. No trouble about getting that strip. And yet they tell us that the Michigan Central Railroad Company is hostile, that they have been fighting them inch by inch in this depot project. If this railroad company is hostile, what did they let them have that land for? Mr. Baker says they were afraid the street would be closed up. What street? Twelfth street. How could they close up the street where their tracks cross, where their line is crossed—

Mr. BAKER: What I said was that they wanted to close it.

Judge Chipman: The Michigan Central Railroad Company knew just as well as I and you know, that they might want to do it until they were blind and deaf and palsied, and yet they could not

do it, there is no way of closing it up; they could not close the streets so as to stop the use of them, and they could not close the tracks so as to stop the use of them. How is this closing to be effected? Let us have a little sense about it. It was not that; what the Michigan Central Railroad Company were afraid of was, that instead of taking 1,500 feet, they would proceed under this very statute which we have cited to you here, and go all the way up, not a great deal further, but go all the way up to Eighth street, and make their turn up to the Fort Street depot off the grounds of the Michigan Central. My friend says that cannot be done. You have listened to authority after authority. You know that railroad companies' franchises may be condemned just as your franchises may be condemned; you know that their property is subject to the same law that your property is; and God forbid that you should ever live in a state of society where that is not the law, where such privileges should be accorded to a combination of men and denied to the individual citizen. And this company knowing that, fearing that, have dropped their hostility and have acted accordingly. My friend says this statute does not mean anything. Listen to what the Supreme Court of the United States says, and you will find in our decisions as well the same doctrine; it is like the air itself, it is free to all Americans, part and parcel of our freedom, rights for which we ought to die if necessary, one of the bulwarks against building up privileged classes, one of the safeguards against oppression, announced by every court, held by every patriot, and clung to by every good citizen under all circumstances. The United States Supreme Court, in the case of The West River Bridge Company vs. Dix,

6 How.. 534, say: "The distinction thus attempted we regard as a refinement which has no foundation and reason, and one

that in truth avoids the true legal or constitutional question in these cases, namely, that of the right in private persons in the use or employment of their private property to control and actually prohibit the power and duty of the Government to advance and protect the general good. We are aware of nothing peculiar to a franchise which can class it higher or render it more sacred than other property."

There it is in good English; the right of the Michigan Central

railroad to that depot is a franchise; a franchise is vested in a corporation; it would be your right, and a franchise is only a right granted by a government to this artificial body; it is called a franchise; and here the law is announced by the highest court of the land, "We are aware of nothing peculiar to a franchise which can class it higher or render it more sacred than other property." Why should it be more sacred than your home? You are only subject to this power of eminent domain. You must give way to the necessary uses of society; and these artificial persons must give way to the same rule and the same necessity.

You have already heard the citations from Justice Cooley and Justice Campbell. They were read to you at the beginning of this proceeding, in which they say that the right of the respondent, that is the right of Mr. Backus, in these cases on the question of necessity, to contest the proceedings is unqualified. He need not give any reason for it; and beyond that he may point out any better way for carrying on the improvement than the one suggested.

What does the constitution say about your duty?

"When private property is taken for the use or benefit of 1287 the public, the necessity for using such property and the just compensation to be made therefor, except when to be made by the State, shall be ascertained by a jury of twelve freeholders residing in the vicinity of such property, or by not less than three commissioners appointed by a court of record, as shall be prescribed by law." "When private property is taken for the use or benefit of the public, the necessity for using such property and the just compensation therefor shall be ascertained by a jury of twelve freeholders." That is the provision of the constitution of this State. You are the jury of twelve freeholders; you are the men to whom this duty is confided in the present case. As I said before, and as has been said to you at different times during this case, formerly the question of necessity was decided by the legislature. Men were oppressed, it became a crying evil, and these corporations roamed about seeking whom they might devour; they would seek property anywhere, because they could get any legislation through with perfect ease. Now, if they had gone with this project to the legislature, as they might, and this clause had not been in the constitution, they would have come home here with a law permitting them to take all this property. There would have been no jury; your interposition would have been unnecessary. The question of necessity would have been settled for them by the legislature and they would have struck through that street, taking the property at all hazards, so that when the constitution of 1851 was formed, the men who formed it said, We will trust no such power to any such legislature, we will only trust that power to a jury of twelve freeholders who live in the vicinity of the property and who will be the guardians of the rights of citizens in cases of that kind. Have you any doubt as to what your duty is and as to the full scope of it.

you not understand that you are here to protect that man a jury of freeholders of the vicinity of the property. Why? Because such a jury are supposed to know and to sympathize with the man. They are supposed to stand between him and ruin, if necessary; to stand between him and the corporation, if necessary. That is what you are there for—sentinels, as it were, on the watchtower over the rights of the citizens, guarding those rights. You are not here to be carried away by vague and general ideas of public improvement. You are not here to register the behests of any corporation, but you are here to protect that man and to see whether it is necessary to take his property, and if necessary, to

give him fair and proper compensation for it.

It is not necessary to take that property because this union depot company have made a map tracing that route out. That question is touched upon in the reports, and our courts have said time and time again that a jury have no business to follow that rule. You would be just like the common council. They map out a plan and carry it there to the common council, and the common council say yes; the common council do not make the plan, but they make it. You will be just like the old legislature; they map a plan and go to the old legislature, and they say yes. The constitution says, though, that they shall not do that any more. And they come here to you, and you do not say yes; you say "We will look into this matter, and we will see if it is necessary, we will see if there is not a better way of doing this, a way which will interfere less with private property, that will take less of the public streets, and will achieve the same result." Now, is there a way? I have already said to you that nobody denies that. Even their own witnesses accede that. Ellis, Joy, every one of them

say that the other way would be the best. Mr. Joy at first began saying that it could not be done anyhow under this statute; that it would require what is called a special act; but when his attention was called to the fact that there can be no special act in this State, but that there can only be general laws, he finally admits that, under the statute that we have brought to you and read to you, it could be done, provided anybody would swear in the petition to enough to start the proceeding. How can it be done? Can it be done? He makes one objection; he only gives one practical reason in all his testimony; he says you cannot do it because if they put an elevated road on the Michigan Central grounds, the posts would be an obstruction. Do you mark and understand that? Posts are no obstruction to poor Backus; they are no obstruction to business people who were there before the road came there; they do not interfere with the use of the street one single bit, and, according to our brother Joy, they are a blessing in disguise, if you only try thera long enough to find it out. But when you come to put them within the classic precincts, within the sacred domain of the railroad company, then all of a sudden they become a nuisance and an obstruction. They become so great an obstruction then that no jury should permit them to be put up there. There is an old saying that you cannot eat your cake and have it too. I do not for the life of me see how you can make these things a blessing to Backus in front of his premises, and a nuisance and an obstruction to the Michigan Central railroad on their premises. They say that

street cars could run under these tracks, carriages could run under them, that all the uses of a great public street could be carried on under them, locomotives and trains could run under them; here is the locomotive on the Central track that has to run

under them. All this has to be done, when you come to look at Backus' case; but the moment you put in the road on the other side of that fence, all these reasons are distorted, and they

become reasons against it instead of reasons for it.

One juryman asked a question that was in my mind, when they talked about these roads being an obstruction if put up in the air there; he asked a question, Why cannot they put buildings under them? Why not? Tell me why not! You will find buildings under other such obstructions. You will find buildings under approaches to bridges, buildings in which business is carried on; and you know, and I know, that the railroad buildings, freight sheds and buildings of that kind are never run to any great height-22 feet would be a great height for one of those sheds. They certainly would not interfere with their use for that purpose.

Mr. Dickinson: You may have forgotten Mr. Joy's testimony, that the Ludgate Hill station in London had three stories of rail-

road running in over one another.

Judge CHIPMAN: I have not forgotten that; but the question asked by the juror struck me as being entirely pertinent. We are not here to find a way for this company to do their work cheaply. You are not here for the purpose of saving their money. are not here for the purpose of finding the necessity of using this street; and the moment you begin to talk among yourselves as to how much it will cost the company more or less, that very moment you fail to do your duty under your oath, you become unfaithful to your duty to Backus, and utterly unfit for the great trust reposed in you by your presence here.

Why not build the elevated road alongside there? Why not carry it right through? There is only one reason why-

that the posts will interfere. But we say the posts will interfere with Backus, and the supreme court say that the business and interests of the respondent in a case of this kind are just as important and as sacred in the eyes of the law as the business and interests of the petitioner. Look at Backus, employing 150 men. How many will the union depot employ, and how many would be employ if their road goes in front there? Will they give you 150 new citizens? You know they won't. That great corporation, the Michigan Central railroad, has not such a number of men in its employ there at that depot as Mr. Backus employs. Which business is the largest, which is of the most real importance to our people, their business or Backus'? You know what Backus' business will do for this city; the merchant knows it, the manufacturer knows it; every man who is engaged in any kind of business for the making of money knows that that much at least is secure, and that that much ought to be preserved and held onto; and while we want to secure the other, and secure the improvements which the union depot company may bring, we do not want to 95 - 55

throw away anything we have got, but we want to keep what w

have got and get as much more as we can.

They say that you could not make a petition to a court under this statute that has been read so often that I hate to repeat it they say that no man could go into court and swear to a petition stating that the Michigan Central Railroad Company did not us that land and had no need of it. Would any of you find any difficulty about going and swearing that the Michigan Central Company are not using 30 or 40 feet in the air there, and that they have no need of it; and have you any idea that the Michigan Central Railroad Company could go in and defend against it? Have you any idea that they have any need of it

You know they are not using it, and the only thing the would be reduced to would be as to the question whether pu ting those posts in the ground there was such obstruction to their business as would defeat the application. I do not believe that an jury would find it any obstruction. No jury would if they believe the testimony given here, to put this road in front of Mr. Backus place, because all the testimony brought by the petitioner is that it is not a nuisance and it is not an obstruction. They could run their track under it; there would be no trouble about it; they could put sheds under it; it would be no interference really, or so small an interference that no jury would take it into consideration, pro vided you believe the testimony given in behalf of the petitioner in this case. Is there any practical difficulty about that? Answe me that. They say no man could do it without committing per jury. Would you commit perjury if you went into court and too oath that they did not use and did not need this space up there in the air. The fact is that they are not using those grounds in any such manner as they are trying to make out; some of those cars lay there month in and month out, as anybody can see who goes down there and looks; they lay there until they are begrimed with dus and age. They are not using it; and it was because the Michigan Central knew that under this statute a petition could be made and that the probabilities were that a jury would give a verdict and tha that verdict would be sustained by the court, that they stopping fighting this project and let them have this corner there, let them have 19 feet for the viaduct, and they have come to terms, so that there is no longer any fight between the two companies. Now, my

friends, there is no difficulty in this; I want to impress or your minds honestly and fairly that there is no difficulty. It there a difficulty? Would you hesitate to take that oath tha

there a dimetrity? Would you hesitate to take that oath that they were not using it, for you know they are not using the heigh! of that elevated road, and they do not need it. And the company would have to come in and prove that they were using and that they were needing it, and they could not prove that the putting of the posts there was an obstruction and a nuisance, if you believe they are not an obstruction and a nuisance to Backus.

Somebody asked here whether the Michigan Central might want to use it for an elevated road; that came up yesterday. Of course they do not want to use it. Their whole system is a system at

grade; they come in at grade, their buildings are all put at grade, and they have no plan on hand, and they have no necessity for an elevated road there; the Michigan Central has not; so that you see that on that score there is no practical difficulty, and if you refuse to give that application to this statute, then I ask you what use are you going to make of it? If it does not mean what we contend, tell me what it does mean? That is fair. If we are not right, then who is right? Nobody will tell us what it means. Mr. Joy undoubtedly had it passed when he had the union depot act Nobody vouches any explanation about it? What does it Evidently it means in some way that one company may take the depot land of another company. That much everybody concedes. And yet they undertake to tell you practically that there are no circumstances under which that can be done. Now, my friends, the circumstance has arisen, the case is here, and if they can go over there it is the best route for them, it is the best route for the city. It saves you the street, it saves Backus, it keeps

the railroads all together there over that fence, and the public

generally will be better accommodated.

Another reason is given here and urged why they should not go there, and that simple reason is that they want to go somewhere else. In other words, they say it is necessary for them to use the street because they want to use it. That is the claim and argument-we have laid it out to go there, therefore it is necessary to go there. That won't do. What kind of men will you be if such an argument as that has weight with you? You are here to determine whether it is necessary. They ask you, Is this necessary? You reply, Yes, it is necessary, because you say you want to go That is what they keep urging on you here—it is necessary because we wish to go there. That is begging the question, and it is exactly what the supreme court say that the jury must not do. They say that the jury must decide that question irrespective of any plan made by the parties or of any wish of the parties. Let us see what Judge Campbell says on that subject, in the case of Grand Rapids & Indiana R. R. vs. Weiden et al., 70 Mich., 390:

"It was objected that the petition did not show the facts necessary to make out a cause to resorting to a statutory remedy. My own view has been that the petition should set out the facts indicating a disability to agree upon a purchase, instead of making a general averment to that effect, especially as the law requires the reasons for such disability to be set forth." That is in regard to some preliminary matter. "It seems to be imagined that railroad companies are to be presumed entitled to proceed to condemn lands at their own option, and that nothing more than a formal effort is

required to give them the right to do so. But under our constitution, this is not a correct view of the subject. Under the old constitution, when the legislature chartered a railroad, the right to build it became fixed, and could not be questioned, and consequently land-owners were obliged to acquiesce. But under our present constitution, there is never any presumption that a railroad is necessary, or that any particular land ought to be given

up to its uses." In other words, there is no presumption that this railroad is necessary, though we cencede we want a railroad here, or that they ought to take this land that they are seeking to take, for the purposes of their right of way.

"Every land-owner, therefore, has a perfect right to object to giving up his land, and is not confined to objections concerning

price or value."

Of course every man has got a right to object to giving up his land, and nobody has a right to abuse you for doing it; that is your right as a freeman; nobody has the right to say you are standing in the way of progress.

"He may object to the lack of necessity for the road at all, or for its location or extension over his land at any price, or on any con-

ditions."

We object to their coming on our property at any price or upon any conditions. Take it, where you can take it, onto the Michigan Central line there. Backus must not be abused here for taking that position. That gifted man, that pure and learned judge, that friend of humanity, Judge Campbell, says he may object, and he is not to be abused for it. "He may object to the lack of necessity for the road at all, or for its location or extension over his land, at any price, or on any conditions." That is the doctrine of freedom, which should be written in letters of gold upon your heart; it is

the doctrine necessary to good government and popular rights, necessary that you and your children and neighbors can be decent and comfortable men and good citizens under

the law of the land.

"In law, his use is as presumptively as important as that of a railway company, and it must devolve on any such company to establish affirmatively all that is needful to make out a clear case

of necessity."

And Backus' use is presumptively as important as that of a rail-road company, and it must devolve on any such company to establish affirmatively all that is necessary to make out a clear case of necessity. Backus' use is as important as the use of Joy and Alger and all these capitalists, and of the soulless thing they call a corporation. His use, as the use of the widow Specht, is as important as that of a corporation; and I say God forbid that the day will ever come when the law will be different, and above all, God forbid that the day will ever come when juries will fail to understand that law and fail to administer it with fair and honest hands.

"And a road already established has no better claim than any

other to extend or change its lines."

Mr. Baker says they have got the right of way, that they have already commenced it, and that that is an argument in its favor, and that that must compel you to find this necessity and influence you upon the question of damages in this case; but here the supreme court, through Judge Campbell, say that that is not so; and who will you believe, my friends? I have given you the words of Judge Campbell, not my own. The argument I have made is found within the leaves of those books, from men like

Christiancy, Campbell, Cooley, Morse and McGrath, from men trusted by the people, from men who have the control of your government and the protection of your lives and property,

whose word is law; and they have manfully upheld that doctrine, that the humblest is as great, in the sight of the law, as the greatest. And it makes no difference how much property is involved, how much public necessity intervenes, it is the right of every citizen that he shall be protected and taken care of by a jury, and at all stages of the process the question of public necessity shall be honestly settled, shall not be determined simply by the demand of the company, and simply by the fact that they say that that is the most convenient and the cheapest way for them. Juries are not constituted to save money to a railroad; juries are not constituted to help them make their improvements; juries are not constituted for the purpose of finding necessities at their behest. Juries are constituted to protect the citizen, and it took us years to get to it; we had to change our constitution to get to it; but here we are, you, the jury, we, the citizen, demanding protection; you, masters of the situation, you, uncontrolled by aught save the law and your own good sense; you are our reliance, not only under the law, but under the circumstances now, our reliance to see that a great wrong is not perpetrated upon us.

I wish to go into the facts of this case now, but as it is late it

might be well to adjourn.

Adjourned to Monday, July 13, 2 p. m.

1298

July 13, 1891-2.10 p. m.

Argument of Judge Chipman Continued.

Gentlemen, on Friday I endeavored to emphasize, so far as I am capable of, the scope of your duty in this matter. I then told you that it was all confined to the limits of the necessity of using this street, and in case it is found necessary, to the question of damages. Those are the limits which the law has prescribed in which we must walk, and of course we are guided in doing that by the testimony in the case. And I need not say to so intelligent gentlemen as these who are before me that it would be extremely unfair to either party in this case for the jury to take into consideration a set of facts which have not been discussed, which have not been brought in evidence before them, and which in law have nothing to do with the matter, because if it could plainly appear that the jury proceeded upon an entirely wrong basis, and any party is harmed by it, there might be a remedy, but if jurors will proceed upon something of which we know nothing of, they may be proceeding upon utterly illegal grounds, and therefore upon entirely unjust grounds, so that we must endeavor to confine our view of the case to the testimony itself, and to keep within legal limits, which I have already described to you as being laid down by the law.

Now there is one question, before I come to the facts, which I would like to call your attention to a little more fully, and that is

in regard to the power to use the Michigan Central property, or other railroad property. You have had the opinion of Mr. Joy that that would be a good route. Mr. Ellis says it would be a

1299 good route. You know it would be a good route yourselves: if gentlemen testified differently, you would not believe them. It is so patent that every one who devotes any attention to it, or gives any consideration to this question, knows that it is the best route to go that way. But we are told that there is a practical difficulty, and in the beginning Mr. Joy seemed to intimate that there was a good deal of legal difficulty in the way. Not a difficulty of fact, but a lack of authority in law to go over these premises, or to go over premises anywhere similarly situated, for a similar purpose. In his last testimony he qualifies that somewhat, and while in the beginning he seemed to think the act of 1881, which he says he might have drawn, had really little, practically little potency in it, in his latter testimony he throws the whole matter upon a question of fact, but in case there is any obscurity in your minds as to the legal aspects of this question, I call your attention to this, you have had the opinion of five lawyers upon that subject, Mr. Joy, Mr. Lothrop, Mr. Dickinson, Mr. Baker and Mr. Chipman. Mr. Baker, Mr. Dickinson and Mr. Chipman are not witnesses in the case, and they simply give you their view of the law, to which you may attach as much importance as reason will dictate. Mr. Joy is not here speaking as a lawyer, in any sense. He is here as a witness, and a witness in his behalf. He is one of the parties in interest in this case, and his views undoubtedly are colored largely by what he conceives his interest to be. I will say here that I have no question, from the outside indications, that notwithstanding all talk about the hostility between the Central railroad and the Wabash Company, in this union depot project, that I have no doubt that a complete understanding, and a mutual understanding has

1300 been reached by these opposing interests. I have no question upon that, and I believe that in pursuance of that understanding, Mr. Joy wishes to go up River street, and the other company, in consideration of his not trying to go across their grounds, have withdrawn any opposition that they had to his going

wherever he pleased outside of their grounds.

The only disinterested witness who has testified as to the law on this matter is Mr. Lothrop, and Mr. Lothrop's testimony is as strongly with us as the testimony of any man can possibly be, and though Mr. Baker, in his opening speech to you, said that Mr. Dickinson had maintained some other position to that which I maintained the other day, and that which Mr. Lothrop testified to here, yet when you read Mr. Lothrop's testimony, you will see that Mr. Dickinson took no position different from what he stated in the opening of the case, where he stands now, where I stand I think he will stand when he addresses you, and where, under the blessing of God, I hope you gentlemen will stand.

The question is this: You remember Mr. Baker read decisions from Massachusetts, from Pennsylvania, from Minnesota, and from New York, and I interrupted him and asked him if any such statute

as this was involved there, and he very frankly and honorably said no, not that statute, not the particular statute that we have here, and I then made the suggestion, which I hope the jury bore in mind, that these cases merely dwelt with the general power under general laws, in the absence of a special law such as we have, for one company to take possession of the property of another, and I then said that we rested our case upon this statute, the special statute, the law of 1881, and my brother Baker said that he was glad I took

that position, because it was not the position of Mr. Dickin1301 son. Now, those cases he read simply confirm a doctrine we
all agree to. There can be no doubt about that. If, under
the law, property is devoted to one public use, it requires a special
law to take it from that use and put it to another public use. That
is all there is in it, and that position we have maintained all the
way through, and the only question was, whether we have a statute
in this State which would give that special authority, and under

which the thing could be done.

Now let us see what Mr. Lothrop has to say on that subject. You remember his being upon the stand. You recollect Mr. Dickinson asked him: "Will you please state whether your present recollection is that your talk with Mr. Mulliken and your familiarity with the laws which were then called to your attention, in connection with this notice of the Michigan Central, was prior to or after the passage of that act." He says he does not recollect having a conversation with Mr. Mulliken, and he cannot tell just exactly what took place with them. He does not say whether it took place or He says: "My recollection is that I said then that my conversation was prior to that." It was before he had that conversation with Mr. Mulliken, in which he undoubtedly affirmed the same doctrine, though not knowing of the existence of that act, because it did not exist, in which he affirmed the same doctrine which he affirmed here upon the stand. He may have thought at the time there was no authority to do it, but his whole testimony here shows that he had no doubt that the legislature could give such authority, and that they did give it when they passed the act in 1881. "My recollection is that, as I said before, my conversation with Mr. Mulliken was prior to that." That is, prior to the passage of the act of 1881. "Your impression of the law, which you stated

act of 1881. "Your impression of the law, which you stated 1302 then, which must have been prior to the passage of the union depot act, was that the franchise of one corporation could not be taken without statutory authority by another. Yes, sir."

Recollect, Mr. Baker says Mr. Dickinson held another position. But here Mr. Dickinson says, "There is no doubt of that at all. But you have no doubt that by express statutory authority, the property of one corporation may be taken by another. A. I think, as I stated before, that I always understood that all property was subject to the power of eminent domain, but that there must be, for the particular purpose of taking one piece of property that had already been appropriated for that use, taking it for another use there must be express statutory authority." The very doctrine we have contended for. "Q. In this State, legislation of this character must be general

in its nature, under the constitution of 1851? A. There was some provision on that subject." Our constitution would not allow a special privilege to be granted to any corporation. It would be impossible, therefore, to pass an act which would give one of our railroad companies power to do this thing. Whatever is passed must apply to all railroad companies, and must give them the power to

do whatever act the law authorizes.

"Q. I will ask you as to your opinion as to the constitutionality of this act of 1881, An act to enable the Detroit, Lansing & Northern to take possession of the depot grounds of the Grand Trunk road, you do not think such an act would be constitutional, that is an act to allow that particular company to do this particular thing? A. I should formerly have been of the impression that it would not have been. I would not dare to answer it now. Q. Suppose an act is passed authorizing one railroad company, under certain conditions and limitations named in the statute.

to take the property of another railroad corporation, or its depot grounds or right of way, do you think that statute would be constitutional? A. I can hardly dare to answer the question, but I will ask another question; do you mean authorizing a particularly specified corporation, and no one else, that is authorizing the union depot company, and no other, to do it? Q. No; authorizing railroad companies generally, under circumstances to be detailed in the act, special circumstances, which are to be passed upon by a tribunal, authorizing any railroad company, under such circumstances named in the act, to take a portion of the depot grounds, or a portion of the right of way of another railroad company? A. I am not quite sure that I understand you, but if I do understand you, I should answer that I do not see any objection, so that it would operate within the power that would govern the taking of private property for public uses." Operate within the same power under which you are acting here now, for that is the only rule under which you are acting. "Q. You have answered already when you had the conversation with Mr. Mulliken, and your familiarity with the statutory law; the union depot act, I should state to you, in order to refresh your memory, was passed in Were you advised, and did you go before a committee as to some portion of it. It is now in the new compiled laws, and was passed in 1881, in June; and at the same session of the legislature in 1881, there was passed this act?" He then reads that section 3557, the section which we have read to you so often, and under which we contend that the authority is given. "Q. At the time to which your attention has been directed, prior to the passage of the union depot act, do you recall there was any such statute on

1304 the books? A. I don't know of any such before that time. Q. This is in the general railroad act. Under this section, to what tribunal do you understand the statute would refer in question of the actual use and the necessity for the aforesaid purpose, for the railroad company owning such land, when it was sought to take it, to what tribunal would the question, under the provisions of that statute, to pass upon the question of the actual use of the land and

the necessity for its use by the company? A. Before I would dare to answer a question of that kind, I would give this matter of jurisdiction of the tribunals a pretty careful examination, which I never did. Q. I will ask you the question, whether in the acquirement of land under the general railroad law, the tribunal provided is commissioners, to be appointed by the court, and at the election of the private individual, a jury? A. Yes, sir. There was originally a provision in the constitution of 1851, which in certain cases was afterward modified, but so far as railroads are concerned, I rememher commissioners were authorized, and the right given the private parties to demand a jury. The proceedings were conducted in some court of record in the State of Michigan, and at the election of the private individual, under the general railroad law there should be a jury to pass upon the question of the questions of necessity and the value of the property. I do not remember any exception to that right."

Now, gentlemen, if there is anything clear, it is that Mr. Lothrop's testimony is on all fours in favor of our position in this case, in other words, that it requires a special statute to devote to one public use property already devoted to another. Secondly, that we have got such a statute in this State,

and that statute is the one that we have been quoting to you here, and iterating it and reiterating from time to

time all through the case, and, thirdly, that commissioners, or, at the option of the private party, a jury is the proper tribunal to which to refer the questions involved. Now, upon that point, I have nothing to add to what I said the other day. I desire to call your attention to, and emphasize the testimony of Mr. Lothrop, because he really is the only disinterested witness in this matter whom you have had before you. What value you have placed upon his testimony can only be determined by the estimation in which you hold him. We all know him, we all love him, we all regard his name, not only as a synonym of honor, but as the synonym of high legal learning, as a man of the greatest legal ability in his day and generation who has ever stood in the courts of the State of Michi-That such testimony, coming from such a man, will receive the highest respect at your hands, and that you will justly regard it as fortifying and strengthening the position which we have taken here, I cannot, for a single instant, doubt.

Now, gentlemen, if you pass the question of necessity and come to the question of damages, of course it will be your duty to review the testimony upon that point. My friend Baker says that all we are fighting this case for is to get damages. I have no difficulty about saying this, if we must have this road, we want to be paid whatever we suffer. I have no hesitation either in stating that if you find the road is not necessary, they may take their damages and keep them in their pocket and give them to somebody else providing they will pass us by and leave us alone; and I must say that the manner in which my brother has spoken of and treated

Mr. Backus in this connection, has struck me, to use entirely mild terms, as being entirely unnecessary. He not only in-

timated that that is his desire, to drive an unconscionable bargain with this company, but even went so far, when he was on the stand, that old, honored citizen, that man who possesses all that he has by hard and honest work, to ask that man if he did not increase his force of workmen at the time you gentlemen went down there to look at the mills. There was no reason for it, because if he had done that, it would have been susceptible of proof. He simply threw that out as a sort of feeler, a sort of skyrocket in the case, to go off in any direction that it might, to hit what it pleased; as if Mr. Backus really would be guilty, or as if Mr. Baker, who had formerly been his counsel and knows him so well, really in his heart believes that that man, for the purposes of this lawsuit would perpetrate a fraud of that kind upon a jury of his fellow-citizens who went down there to examine those premises. Surely that is not the right spirit for a great corporation to approach a citizen. There is a lack of respect, a lack of fairness which should prevail in doing business between fellow-citizens, and which should especially prevail when a great corporation comes in and demands of a man his property and his rights in a condemnation proceed-

Now, my friend Baker tells you that this railroad is no damage to him, that it is a benefit to him. Well, my view of the law is that, in a proceeding of this kind, it cannot benefit a man against his will, and against his wishes, to commence with. I am entirely wrong, or the law is that the question of benefit is not to be taken into consideration here at all. He cannot receive any peculiar benefit unless he receives this railroad under his roof there on his premises. That is conceded on all hands, and this great corpora-

tion come here, and like a second Providence, tell Mr. Backus that they have a better way of doing this business for him, and because their way is better, he must take their way and They say to him, Your way of handling your lumber and bringing it from your yard is too expensive; we will put a spur in over your premises, between your fence and your factory, branching off from our line, and we will run a lot of tracks in there alongside of your planing mill, and you must have all your machines upstairs, and, instead of dumping on the ground floor the material which you use by the side of the machine, we will let you take it in on a series of railroad tracks running between these machines and alongside of them-great big flat cars standing there all day, this entire floor completely barred and ribbed with these railroad tracks, and he will have to feed his machines at such times as would suit the convenience of the railroad to give him switches, and on such terms as they choose to impose upon him.

Now let us have a little common sense. In the first place, that man's mill is fixed to do the business on the floor below, as you all understand. What should he come upstairs for? Why should he come upstairs? My friend Baker, in behalf of this great corporation, says that it would be better for him to go upstairs. Suppose this corporation wanted to take a cottage that you owned, and you had a fancy to have a hall right through the center of that house

and their tracks come right up to the front door, so that nobody can get in and get out. They say you are very foolish, why don't you have your entrance in the back; why don't you have it on the side? You say I want it there. They say, But O, my friend, you have a great big hall that takes up too much room in the house, close it up. Your door is too expensive, you can put a little

cheap door in there. Your portico, where you sit at nights 1308 with your family, that is not necessary. If you were a wise man, you would never have put in a thing like that. Put two or three steps, a sort of a little cubby of a door on the side, and go in that way. You can put in something cheaper than that, and put it in better. You ought never to have had that in there. And therefore, you spoil that house entirely for your family and your living, and we will only pay what it would cost to put up a little cheap door and two or three steps on the side. There is not a man on this jury, I don't care how much he loves railroad companies, I don't care what disposition he may have to be accommodating and complacent to them, there is not a man here whose blood would not boil if a jury of his countrymen stood by and said such an inposition as that should be practiced on him. It is pure, unadulterated cussedness on the part of a jury, an infringement of man's most sacred rights, without one mitigating circumstance, and I have only this thing to characterize it, that the men who did it were doing the dirty work of a corporation which as time goes on they find cares nothing for them, and which as time goes on they would find, if the necessity of the case requires, would crush them to the earth.

How can Backus use this elevated road for switch purposes? Have a little sense about it. Adams says he has his peculiar arrangements, but when I asked him if he could move his lumber at the planing mill as cheaply as Mr. Backus does, and he asked me what the amount was, and he was told the amount which Mr. Backus afterwards testified to, he said if he did it for that he was doing it very cheap. And yet the improvement is to constitutions the same of the said in the said is the said in the said in the said in the said is the said in the said

taking up the space where the machinery should be for railroad tracks, for serving the material to the mill from flat cars, and by moving the whole plant clear up into the second story, and so changing the entire arrangements of his business at that place. Now, gentlemen, let us be reasonable about it. The law says that if Mr. Backus prefers to do his business downstairs the railway company have no right to say he shall go upstairs. That is his undoubted legal right. You cannot here, you cannot anywhere, in any country or in any land, too strongly protect the personal right of the citizen. Wherever you are, the duty involves upon you to see to it that these rights are vindicated. Let there be no mistake about that. Above all, let there be no trampling down of those rights. The old saying is, that continual dropping will wear away a stone, and I tell you, my friends, there is a dropping going on in this country, and has been going on for the last fifty years, notably in the years since the war, in which the rights of the plain people, as Mr. Lincoln used to call them, meet with very little

mercy at the hands of these great corporations and the great capitalists of this

talists of this country.

That is his right, to do his business in his own way, and my friends may talk all day long about its being better for him to do it in some other way. That does not release them from the burden of paying him damages for breaking him up, in the way in which he does business at present. He must get a new dust-arrester, forsooth. He must get a new system of switches, forsooth. He must move his plant upstairs, forsooth, he must take that mill and rebuild it from top to bottom, make a new mill, better for him they say, and yet they say you must not give him any damages, his damage is very trifling. It is not worth talking about.

Poor Backus, who has been studying the subject of fire-drafts and smoke consumption and the subject of dust-arresters all

his life, they say has been an old ninny, an old fool, does not know what he is about, and he has come here and has grown grayheaded, has built up this vast business and has these two fine young men, his boys, established in that business, and he has accomplished more than some of us who talk so loud and so eloquently and so strongly have been able to accomplish with all our life-work, he has aided in building up the city of Detroit, he is filling the mouths of family after family by the industry which he furnishes and for which he pays, and this man is a poor old dotard, he does not know what he is about. Change everything, change himself, make himself over, poor old man, dye his hair, color his whiskers, put on a new dude suit of clothes to come up to the present generation of these modern improvements, and yet my friends, that man has accumulated that great dock property down there, accumulated and paid for that great warehouse property on Fort street, accumulated and paid for the roof over the head of his family, on Ninth avenue, or Lincoln avenue, has accumulated and paid for that wonderful mill, has gone through panics when rich men and strong men and enterprising men fell like autumn leaves, as you will remember who are old enough to remember that time. He has gone through the devastation of fire, stripping him, stripping him nearly bare of his possessions, and yet he has recovered, since 1881 or 1882, I think it was when the fire was there. We find he has gone on and rebuilt his mill and paid for it. We find that he has brought it to a paying basis over and above the capital which he invested in it in the process of paying for it. We find that he has stood square to the world, facing every storm, meeting without a quiver every

1311 misfortune which befell him, and we find him now in his old age, with all these trophies, this monument of his bravery, his industry, his integrity around him prepared for the rest of his life to enjoy the ease which gray hairs ought to bring to him; we find him here denounced as an old dotard, a silly man who does not know his business, a man who is standing in the way of progress, as a man who is trying to filch money from railroad corporations, this honest man, this good man, this industrious man, who, in his branch of business has been foremost in the ranks of progress, he is held up to this jury as an object of contempt, simply because he will

not lie down and surrender that which he has earned so hardly, at

the behest of this company.

Now, gentlemen, that won't do. Mr. Backus is not a bad man. It is just as right for Mr. Backus to wish to be paid for his property as it is for Mr. Joy to wish to get it as cheap as he can. All the advantages are with the railroad company. Certainly the power, the strength, the wealth, all is theirs. There is no doubt about that. Why should not I take Mr. Joy and hold him up to you as a hard-hearted monster, as a bad man, because he is trying to get this property for his company as cheap as he can. If I did that, you would say that is not right. You would say, Chipman doesn't feel that way, he is only talking that way to us, we see through it, and of course you would feel that you were great fools if you allowed any such talk as that on my part to influence your judgment in a matter so important as this.

Now, the truth is that Backus probably knows more about his business than you do or I do. Those are the chances. He has kept the planing mill; he has made it successful; he has made a

fortune out of it, and he has got that plant there into such a
1312 position that he gets a rental of \$5,000 a year for it from the
company, besides being an owner of part of the stock of that
company. All the indications are that he does know what he is
about. That he has been a shrewd man, and, gentlemen, I believe
that all the indications are that he has been an honest man.

Now, my friend Baker knows more about the planing-mill business than he does. That is all right, but, my friends, there is not one of you who, if you desired to go into that business would go to Mr. Baker in preference to Mr. Backus. There is not one of you who would take his advice in preference to the other man's. It is true that Mr. Francis Adams came here, and he is the only man that has come here, and rather intimated that there was something wrong about Mr. Backus. It seems he did not like him. I don't believe Mr. Backus likes Mr. Adams, and so there are two of them, and that is a thing you and I have nothing to do with. He rather intimated that Mr. Backus' way of doing business is not the best way, but I take notice of this thing, Mr. Backus is in the business yet, and Mr. Adams isn't in it. Mr. Backus is a live man, Mr. Adams is simply looking on now to see what Mr. Backus is doing. Now, all that is fustian. It is nonsense. It is against every practical idea which any one of us entertains. It is a sort of talk that no man would use to any of us if we got outside of that door. It is a sort of a talk that no man would keep up an instant when you get up from these seats and go out into the middle of this floor. It is talk for the occasion. It is lawyer's talk, it means nothing. It is idle babbling, my friends. Let us take a practical, sensible view of the case instead of this view.

Now, we heard a great deal about these dust-arresters. We are not trying which is the best dust-arrester here. There is a supreme mistake which we came near falling into until the jury very wisely cut it off, a mistake which my learned friend, Mr. Baker, would very gladly humor you with. We lawyers have

a way of trying to get a jury off sometimes on a side issue. It is one of the old tricks of the trade, to hammer away and dispute about a thing which is of no earthly consequence, but what we are to discuss here is not whether Mr. Backus can get a better dustarrester there. You decide this case and put into your verdict that you decide it on the basis that Mr. Backus ought to put a better dust-arrester in there, and can get a better dust-arrester; and the supreme court would not let your verdict stand a moment, because it would not be law, it would be wrong, it would be wicked. It would be against that law laid down by Judge Campbell, which I read to you the other day. Mr. Backus can do his business as you can do your business, in your own way. He can do his business in his own way, and he is not compelled to change and to adopt the judgment of the union depot company as to what is a better way of doing that business, and especially he is not compelled to go to the expense which is necessarily involved in order to make that change. All this talk about dust-arresters is of no earthly consequence here. There is one supreme fact, however, in connection with all these dust-arresters here, they have got a hole in the top, and whether it is a metallic dust-arrester, or whether it is a wooden dust-arrester, the hole is there in the top, the dust is there at the top, and Mr. Thompson says in his dust-arrester the dust escapes from the top. It lies on the outside, and if a spark went into that hole among the dust, if the spark has life enough in it, it will go off like powder, so that if this was a Cyclone, or a

Vortex, or any other dust-arrester that they are talking about, just so long as there is a place for the air to go out at the top, just so long as there is a place for a spark to come in, just so long as there is a place, if any dust is going out with that air, or if the air veers to this way or that way and the spark comes with the wind and has vitality enough to strike the dust, it will run like gunpowder and set the whole thing off. That is as you all know. Mr. Thompson testified that more or less dust comes out of this You saw the Backus mill, you saw how clean it is. He testifies, and you saw it, that they had no trouble with dust lying around there. There is no train of gunpowder lying around that dust-arrester, to run off and catch fire and communicate with the The danger all comes from the spark coming with the wind through one of these openings, the air being inside, the opening on one side and the wind blowing on the other, coming there it will set fire to the building. It makes no difference whether the dust is on a piece of sheet iron, or whether it is on a piece of burlap, any more than it would make any difference whether so much gunpowder or dynamite or gun cotton was on a thing of that kind. Touch it, it goes off, and devastation and flame follow. That is the way it is done in flour mills; that is the way it is wherever dust of flour and wood, and the dust of flour and wood are both vegetable substances, wherever dust of flour or wood is collected and a fire is ignited, that is the way it goes off, and the poor man who happens to be where it comes is scorched and shriveled up and killed, it comes so suddenly, with such a flash, and is so deadly and fierce.

Do you want me to argue it to you, gentlemen, living in this glorious nineteenth century which Mr. Baker has eulogized so, you men who are here with your eyes open to see just as much

as he sees, knowing what progress means, do you wish me 1315 to argue to you that there is no danger from a locomo-Shall I argue that? Shall I argue to you, gentlemen, that sparks from a locomotive will set fire to objects they come in contact with? Shall I argue to you that the grit and the steam and smoke from a locomotive will dirty fine wood and impair its value? Shall I argue to you that clouds of smoke and steam passing between the window and the light will darken the window? Shall I argue to you that this structure in the street there, coming up to the line of his fence nearly, and as high as the third story of his place, that that will intercept the light to a greater or less extent? I don't know why we have to argue these things. You go with me to New York. You are not trying to build an elevated road; you are simply looking around to see how things are. You and I go along an elevated railroad, cross under it, on Sixth avenue or Twenty-third street. I have crossed under there hundreds of times, and I presume many of you have who have been to New York. Your first impression is that it is dark. Your next impression is that every street that the elevated road goes through is ruined, and it is ruined. My friend Baker partially conceded that the other day, said they would not try these things on Woodward avenue and Jefferson avenue, but it was done on River street, and the very morning after he made his speech the paper was full of projecting a line of elevated roads up Jefferson avenue and Woodward avenue, running them in front of your fine residences, in front of your fine stores. And, my friends, they run out nearly every great store, and they certainly run out every fine residence, and you cannot get your women and children to live on a street with an elevated road running right in front of your door.

We all know it. So that it is not only poor Backus with his factory and his little obscure street down there, but this thing is liable to strike you everywhere and anywhere. And when any man tells me it is a benefit, when any man tells me it is a benefit to compel workmen to work by gaslight or by electric light, benefit to the book-keeper to do his work by artificial light, it is a benefit to cut off the air and the light of the sun, it is a benefit to give you smoke to breathe, and steam to breathe, and those indescribable gases to breathe, I will simply say to you I don't believe, you don't believe, you can't believe it; it is not true, it may be a damage. It may be that these poor fellows who have to run these planing mills, who have to sharpen those saws and set them, who have to keep those planers in good order-it may be that their flesh and their evesight is not so valuable as that of some of the rest of us. I think it is just as valuable, and I am very certain of one thing, that any laboring man who has a particle of good sense, who would allow himself to be forced to work in quarters like that, is a traitor to his craft and a traitor to his country and to his family, and he does not deserve the respect and the consideration which is due to a good

citizen. It won't do, my friends. You cannot choke or shove labor into dark holes and pits; you cannot make a man work all day long with scant wages and cut off from him the only thing which God has vouchsafed to him for nothing—or one of the few things—the light of the sun and the fresh air of heaven. You have to pay for your water, you have to pay for your heat, but the sunlight and pure fresh air we never have had a tax on, or made any attempt to imprison them, or cabin and confine them, until the union depot company comes in and says, On the whole, it is rather a good thing for a man to be treated

1317 in that way; it will be a benefit to that property. You do not believe that? I know you do not believe it. You may see some other way of doing this for the union depot company, but you cannot do it in the way they want you to do it. If Mr. Backus is to be robbed, he has to be robbed by an entirely different argument. You will never make that argument. You will never agree with that argument. You will never do it on the principles laid down to you in the argument which has been made to you, because you know that these principles are false, and that no community can live under them, and that no community ought to live under them.

So, my friends, here comes this railroad in front. They propose to benefit Backus by adding to his troubles, by having him erect these side tracks in front of his premises close up to his windows. and by changing his dust-separator and changing the position of everything in his mill, by changing his system of doing business and by making a new Backus of him, making him all over, this poor old man, reconstructing him. Remember, in the old days the great question was of reconstructing the South, trying to reconstruct our colored brethren, and the union depot company seem to have some idea that they can reconstruct these Backus men here, father and I don't know what they can do with the young men, but the old man has got to an age when, I think, it would be rather cruel Perhaps he has seen so much trouble that he to make him over. does not want to be nade over. Perhaps since this company have come tramping upon him and on his lumber piles in his lumber yard, and with their threats of using him up in that mill, perhaps the old gentleman thinks he has lived in vain—that he does

1318 not care about having a new start. Perhaps he does not approve of Mr. Baker's way of starting, anyhow, so I am constrained to think that they will get very little comfort there.

You have heard authorities read here from New York. Did you notice that in every one of those cases the judges speak of the gas, the smoke, the steam, the oil and the dirt? Now, some of you gentlemen who have been in New York know that, in spite of their pans, in spite of all they put under these elevated roads, there is a continual dropping of grease all day long, just as you see dropping on any other railroad. But on these elevated roads there are droppings of grease, and then again, in case of snowstorms, everything drips down from above, whatever there is upon the track or upon the platform, carrying it down into the street. You have seen this,

769

those of you who have tried it. How would you like to drive into Backus' yard, in through that front gate there, get a load of nice clean lumber, drive in and get your lumber, and you start out, and the first thing you know there comes a shower of grease, great spots of grease on two or three of the boards. You take it home, you have bought it, taken your risk about it, it does not please you, what are you going to do about that? But if the dirt was in the mill and the board was injured there instead of under the track from overhead, you would say to Mr. Backus, I cannot buy that, you must give me a clean board. But you have bought it and paid Mr. Backus, you have gone off, and the top board gets a deluge of this, or you get a few spots on it. You cannot go back to Mr. Backus with that and ask him to give you a clean board. He may have lost a dozen boards to give you one clean one, but he gave you a clean one,

and you say you will go and deal hereafter in clean places.

1319 But my friend Baker says there is no trouble about that;

true, you have spent \$9,000 in digging that hole there, so as to give this opening on River street; fill it all up again, raise the mill up, do all your business on the Fort Street side. True, the Fort Street side is only 75 feet, whereas this side of that property is 385 feet wide; true, there is a physical impossibility for you to do the work on the Fort Street side; nevertheless, change it all around; this company wants your property; they want it bad, and they want it for nothing; change everything around simply because we ask you to. Now, my friends, that won't do. You are not going to make Backus do anything of that kind. You do not want him to do anything of that kind. You find him there contented, you find him there prosperous, you find him there with one of the best mills of a city, you find him there doing a successful business against a competition which is enormous, because you know that these mills are scattered all over this city, and the competition is enormous. What have you got against him? Have you anything against him? Has he done anything to you; done anything to the public? Is there anything about that man that you should take and turn him out of his own building, strip him naked to the very skin, to the very flesh?

Now, you see, Mr. Joy comes here and tells us that that property is practically worthless. We have a young man from New York named McIntosh, who came here and told you something else. Mr. Joy tells you that because he is interested, and wants that property. The young man from New York, McIntosh, tells you that because he is a fool; that is the reason he tells you that. He is sent on here by Mr. Gould to astonish us Western fellows; to

show how the thing is done in New York; and I think we 1320 can all unite in a letter to Mr. Gould, and say that the young man did astonish us beyond all peradventure. That man would give you \$400 a foot for your property over here, Mr. Freud. You have got a customer. He would give Mr. Freud \$400 a foot for property at the corner of Congress street and Woodward avenue. I am not going to talk about him. I am not going to talk about Pangborn, except to make this remark. Pangborn was

97 - 55

got up for the occasion. Pangborn had on a magnificent white necktie, and I was in doubt whether he was a bishop or a blackleg, to tell you the truth. It is pretty hard sometimes to tell the difference; but he came out in very great style. If Pangborn was as good as he looked when he came on the stand, he is good enough to be a bishop. If he was gotten up for the occasion he deserved the other epithet. Pangborn looked with great benignity on you poor benighted countrymen. Curious they have got to go to New York to get men to come here and tell what we have to do in Detroit. He made you think of one of the Apostles of old, coming around and showering his blessings in all directions. He thought that you men did not know as much as you wanted to know, but he would forgive you, he was not going to be hard on you for that: but I say to you Pangborn did not look as fat and slick and well fed when he left the stand as he did when he came onto it. We knew about Pangborn, we knew he was coming. He shriveled, he lost flesh, he wrinkled. He did not know what was going to be poured upon him as he sat there. He came here and he talked pompously, and he talked about Martine's testimony, and yet, as a matter of fact, he did not disagree with Martine, and that whole subject of Martine's testimony simply was this-I may as well say it now as to say it by and by; Mar-

time said that everything went down in the panic of 1873. 1321 We did not need a man from New York to come and tell us We all knew that. Some of you may have known it to your sorrow; but they brought a man from New York to tell us that. We all knew that. He said that in 1873, after the panic, all values went down, but that they recovered less in proportion in the elevated-road streets than they did in other parts of the city. Wasn't that his testimony? He put it in that way. He did not say in so many words, "I am sure that the elevated roads did this thing, but he did what you and I would do, found that wherever the elevated roads were, that the rise and recuperation of property was much slower, and was much less than it was where the elevated roads were not. That streets similarly situated, within a block either one way or the other rebounded and recovered their prices, whereas the property along the elevated road did not come back to the prices they formerly held. It was perfectly justifiable when he found one fact and one cause common on certain streets, the situation of things there, it was perfectly justifiable in saying that, in his judgment, it was the elevated road. You would say so, and I would say so. You run an elevated road up here on Griswold street and leave the street below clear-Shelby street; immediately business will go over on Shelby street, stores will be put up there, great concerns move in there, Woodward avenue and Griswold street practically deserted; you would say the roads did that. If you did not say it, what would be the cause? What else could you say? Both lose the custom and trade, and another street which was not so important a street before the roads were put there commences to boom, and you would

say, of course, the roads have done it, and that is what Mr.

Martine said, and that is the good sense of the thing. Mr.

Joy says he rode down the street under an elevated road, and that it was just as nice, and he says they are putting them five or six stories high in London, and that, on the whole, they are one of the blessings of a good Providence to a wicked world. You know better than that. I need not tell you, and I will not tell you, that these elevated roads are not a blessing. A great many people like the sight of overhead wires of the electric railways up and down the street, but the majority of people object to them. What is the objection to them? They have those posts put up and down the streets; wherever they are put up, and I know what I am talking about, they are resisted as a nuisance and an obstruction. They tried to put them up here in this city, and the people almost en masse rose against them, and the case went to the supreme court, and I read to you one of the opinions of the supreme court, that of Justice McGrath, one of the judges there.

This taking up the streets of a city with anything is a very serious matter. It may be a very great convenience to people living a great distance out, and undoubtedly under certain circumstances and to a certain extent, and to a certain extent only, it is a great benefit to trade, but after all you must be sure that it is going to help trade, not that it is going to crush it out. An elevated road up and down Woodward avenue would crush trade out, except just at the corners where the stations were; if you happen to be lucky enough to have one of those corners you would probably get a good trade, but the men between the corners would not get a good trade. So that, in that case, as far as elevated roads in the city helping trade and helping business, practically they hurt business.

and for that reason, among other reasons, there has been in New York this onslaught upon these companies for damages.

The song is sung there that is being sung here, that everybody is to grow rich, everybody is to be benefited, if they build a new depot. Their building is only to cost \$250,000. That is the little egg from which all this prosperity is to flow. Everybody was to be rich in New York out of these elevated roads. The business is cut off, ruined, and so they are literally thatching that corporation with actions for damages. The juries and the courts are giving them damages, and giving them liberal damages. At Harlem, clear up at the head of the island, a lot of real-estate speculators got rich. And so somebody in Grosse Pointe will say, By all means give us an elevated road on Jefferson avenue, all the way up. Somebody out at Royal Oak and some one else at Dearborn would want elevated roads, and they would get rich. In the meantime, what are you men to do who are living here, the men who keep stores, the men who have elegant residences, who have homes that they intend to live and die in. What are they going to do?

That is exactly what took place in New York. That is why these suits for damages were brought. The courts recognized at first that these corporations affected the rental value of the property and gave damages for that. Finally the court of appeals took the position that it affected the value of the fee just as we claim that it affects the value of the fee in Backus' case, and they permitted damages

for that. How is it going to affect the rental value of the Backus premises? Backus is getting \$5,000 a year for that wonderful piece of property where the mill is. It is a pretty good rental, isn't it, \$5,000 a year? How is it going to affect that? Who wants to rent it? He might put up a block of stores and face them

on Woodward avenue, if he would build the stores in a curious shape, with a sort of ram's horn, and he would have to do it in order to make everything front on Fort street. How can he rent it for a mill? Who would want it for a mill, who would want it for any business which required cleanliness, which required light, which required good air? Yet there he is getting \$5,000 a year, and that he is sure of for life. Five thousand dollars a year is a good rental to any man. A man is very fortunate who, at the end of his career, has one piece of property that he can rent for

\$5,000 a year-with all the taxes paid upon it, understand. Now, my friends, do you want to go and rent that property at \$5,000 a year? You are business men, you are shrewd men. Some of you men on this jury are men of very large business and large affairs, and remember the way you feel other men are apt to feel on questions of this kind. The great mistake men make in this world is to think they feel differently from other men. Another mistake is to think that they can do things better than other men. You will see it every day; one fellow gets up and says something, another says that is all right, but you don't say it in the right way, and he gets up and says it, but he doesn't say it any better. We are whittled off the same stick, all made of the same old piece. Just as you feel, other people would feel about it. There is no use of saying, "I would not do it, but somebody else might." chances are that whatever you would do, somebody else would do in a matter of that kind. Who is going to rent that property under those circumstances? Who will take it except the Backuses themselves? And, according to Mr. Baker, it is not worth any-

thing to them unless they remodel the whole thing, change it around front end to, and put in new machinery, new buildings, new dust-arresters, new engines, fill up the big excavation that is made there, take up the water pipes, take up the sewers, take away those thousands of dollars that are put there, or throw them away, rather, and then, my friends, you will have a nice concern there; and, mind you, he is to do all that at his own expense, and not at the expense of the union depot company. If that company want all these things done, let them come up like men and say, You give us the right of way there, and we will enter into bonds to build Backus a new mill. That is what they propose for him to do. Don't let them deceive you with this cry about railroad facilities. Backus has all the railroad facilities he needs. Why should be want any more? Why should be give any more of his room there for railroad spurs, for railroad tracks coming in? He has communication with every railroad on the continent of America, east, west, north, south, to ship goods everywhere. He has got enough, got all he wants, all that anybody wants, and yet my friend talks about giving him as an inducement, this other connection. That sort of talk is nonsense. It cannot influence you. They propose to cut off his light, propose to deluge him with gas, with smoke, with cinders, propose to endanger him with fire, they say these things do not happen very often, but they say we do not propose to take the chances of its happening, we propose that Mr. Backus will take them. Now Mr. Backus has carried insurance on his mill and yards to the tune of \$250,000. He had insurance on his mill before, some \$38,000, and he lost nearly \$100,000 by that fire, and as things run now, he is taking about half the risk himself,

half of the loss of fire he carried and the other half the companies carry. But the risk becomes so much greater, that those who insure him, the men who testified, not as experts.

those who insure him, the men who testified, not as experts, but as the men who are doing the business with him, the very men themselves who carry his insurance, the men to whom he looks, they come here and tell you they do not know whether they would take the risk at all, but that they would raise it to the enormous figures they mentioned, and they would expect him of course to increase the amount of insurance in every direction, so that the amount of probable loss will not be so great. They cut his yard up into four pieces, all on account of those engines coming through there, compelling him to raise the insurance, and in this mill he will have to double his insurance in order to feel any safety. They say he need not do it. Of course he need not do it. You need not insure your house, you need not insure anything. You may say a fire may not occur. That may be true in nine cases out of ten, that there won't be any fire; who will take the risk of the tenth chance? tenth chance comes around in the shape of a locomotive and blows you up, and you say to yourself, what a fool I have been. No man wants to take such a chance in a business like that. The business is risky. It is peculiarly risky from fire. It is in that direction that the principal risk in that business lies. The very incarnation, the very worst form of that nature comes in the shape of a locomotive vomiting out smoke and steam there in front of these premises.

But they say there won't be much of it. Do you think that is the way our friends talk to the stockholders? Have you any idea that that is the way they get men to go into that project, tell them that they are only going to run five or six trains a day? Do

place for nothing? Do you believe they will put the switches right in front of him for ornament? Are they put there because they look pretty? They are going to be put there because they are going to make up trains there. They tell you that they are not, but they are. They have all the tools to do it with, and they have put their money in there in order to do business, and these railroad people are pretty practical kind of people. They are

not playing for fun, they are playing for keeps in this entire thing. They propose to win. It is heads I win, tails you lose. They are just as eager for the last penny as any man in the community. And vet, according to their story, it is nothing but a little play road, a little toy affair—a play freight-house up here on the corner of Congress and Third streets, acquiring land there just to play railroad.

They are not going to have any freight there. O, no. Going to put on toy trains; no switching there, all that there for ornament; just to give you a sample of how to build an elevated road.

My friends, this is fustian, utter nonsense; it is trifling with you, trifling with this jury, this solemn tribunal appointed by law to guard that man's rights, and to see that the rights of the citizen under all circumstances are protected. I repeat to you, gentlemen of the jury, it won't do. Their whole position here is false in general and false in detail. You cannot touch it anywhere, you cannot dissect it anywhere but what you find that their simple proposition to you is to make Backus pay for the building of this road, and to make him bear an undue share of the public improvement which this road will be. If you feel that you should be generous to the

road, you men who are rich, put your hands in your pockets 1328 and give them your money. Do not give them Backus' money. I say that because they are begging you to give them Backus' money. If they should come and ask you to give them your money, you would tell them no, you would keep your money in your pocket. That is what they are demanding of Backus, and why should he pay this enormous tax for the general benefit? You might as well add on the general assessment-roll every year, when you come to Backus, so much, say we will make Backus' proportion of this tax \$100,000 more than the proportion of any man in the city-make him pay this. It is the same principle. Why should he pay for the general good? Why should he pay? These burdens, which good citizenship requires every man to carry, are all right. The law is to make every man bear his own burden, but only his own burden, and the great object of justice which you are administering in this case, is to be sure that you shall not put upon him to bear that which does not belong to him, and to be sure that he gets that which does belong to him.

Mr. Backus, forsooth, wants you to give him \$300,000 for his property. Who said that? When did he say it? Has he said it to you? Perhaps he has whispered it into your ears. Backus wants to force this railroad company to buy all the land between River street and Fort street and Congress and Third streets. To whom has he said that? Wants you to start in clear down at Eighteenth street and come up through that way. To whom did he say that? Where did he say it? I am authorized to say for Mr. Backus, with my friend and colleague in this case, Mr. Dickinson, that we never have said that we wanted to drive a hard bargain with this railroad. We have said to you, Keep the railroad away from us, and let them keep their money. We want none of it. But if you

1329 force the railroad upon us, then, my friends, see to it that we are compensated for the great damage which putting the road there will cost. Practically it is the breaking up of this large business. There is no theory upon which the railroad people present the case to you which does not involve an entire change and rebuilding down there. It means for Mr. Backus to change that which belongs to him, to take it and go somewhere else, and buy another property.

I was saying to you when you took the intermission that the theory on which this petition is urged and supported is that everything should come out of Backus, that all doubts should be decided against him, that every contested point should be decided against him, that his rights shall be minified, and that the jury shall deliberately make as little of the damage done to him as they can.

I may be all wrong in my view, but I certainly would not give it to you if I did not conscientiously believe I am right. I think it is your duty in a case of this kind to take exactly the other position. I think it would be your duty to give this man a little too much rather than to give him a little too little. I think it is your duty to see that by no chance he shall not be compensated for the injury which is done to him. If you gave him nothing, you do something that would be as wonderful to me as if the Lord himself should come down and help a railroad company. I should as soon expect an angel to come down here and help Mr. Joy. I have no fear of any such result as that. If he deserves nothing, give him nothing.

Mr. FREUD, a juror: How would it be if you told this company

to go on the other side?

Judge Chipman: In my humble judgment it would be doing just right, it would be doing what you ought to do. I dwelt on that on Friday, and I do not propose to re-echo it again; but if you must inflict this calamity on this man, do it at the expense of the railroad company, do not do it at his expense. Let them foot the bill. The old saying is that he who dances must pay the fiddler. Let them pay the fiddler in this case. If Backus has got to move, let them pay for his moving. If his business is ruined, let them pay for that. If his insurance is increased, let them pay for that. In other words, say that reasonably he shall have no harm whatever by reason of this proceeding. This company does not come here like a car of juggernaut for us to cast sacrifices to it, for people to be crushed under its wheels. It does not come here to be a calamity to this community, nor to any member of this community. It is here to help; it should come to us like the breezes, and like balm; it should come to invigorate commerce, give prosperity to our city, and in no single instance should it crush any man out or break up any man's business. believe that I am as public-spirited as any man among you. have no doubt that Mr. Backus is as public-spirited as any man among you; but it is a heresy to say, it is a heresy to freedom, to common right, to say that you ought not to resist this attempt to do that which is not necessary, that which will injure him, and to do it at his own expense. Put the road on the other side of the fence if you can. They began this case before all others, and when they found this question contested, instead of going on with it again, they kept it off and kept it off until they have settled with the others, and think by the pressure of that to drive you into a decision against Mr. Backus upon the questions which they could not get decided in the first case. It is very shrewd, always pro-

vided that you are weak enough and wicked enough to let any such manœuvre as that stand between you and the rights 1331 of your fellow-citizen. That was the first case the question came up in, and now among the very last they come to you and say, "Well, we have these grounds up there, we have this mau's property, that man's property, and the other man's property, and, therefore, you must give us Backus'." I do not wish to hurt this corporation. I do not propose to call on you to do anything here out of prejudice or hatred against a corporation. I would be ashamed to do it; I would regard you as unfit for citizenship, unfit for this duty, if you let any prejudice or any feeling of that kind influence your action. All I demand is that the two parties be put upon the same level, not that the corporation shall come in here and say, "We are a great public improvement, and, therefore, you must throw sacrifices to us: we are short of money, and, therefore, you must give us something out of Backus' property; we have already acquired property and rights in connection with this right of way, and, therefore, you must give us Backus and his interests in order to help us out." I ask you to take simply the views of the law; to put the two parties on a level, to put them as if this was the first case which had ever been tried in connection with this improvement; as really it was one of the first that was tried before a jury. I have no objection to these corporations simply because they are corporations. I do think that corporations are multiplying too much in this land; I think there are too many of them; I think this putting of every business of life into a corporate form tends to degrade the tone of morals in the community, tends to make men narrow and selfish, and, I think, in the long run it will be found an unmitigated curse to the country. But, in a proceeding of this

kind, I would not be so demagogical as to appeal to any prejudice against a corporation. Your duty is to do equal justice, and the demand made upon you by the petitioners in this case is to do unequal justice, to throw all the weight of what they have got and what they have not got, the money that they have and the money that they have not, and the land that they have acquired and the land that they want to acquire, to throw all that in the scale against Backus, and to do this thing at his expense instead of at their own. If you want to buy property you must pay for it, and, as an ordinary rule, you cannot take your fellow-citizen by the throat and bring him before a jury and say to the jury, "I want that man's property, give it to me." This corporation may do that. because the law says they may do it, but the law which says they may do it says that jurors must exercise the utmost care in scrutinizing the testimony, exercise the utmost vigilance that the rights of no man shall suffer by the proceeding. It is a very high act of power to take a man's land from him against his consent, and the law for that reason has fenced it round with this institution of the jury. It is put to you in this instance here, to you as the guardians and protectors of the citizen, to see that no harm shall come to him beyond that which the absolute exigencies of the case demand. There must be a necessity to take this street; there must be a necessity to take that street from the public; there must be a necessity to take it for a great public use; there must be a necessity to take it, because there is no other way than to take it coupled with this great public improvement. And if that does not exist, then they ought not to go there, and you ought not to let them go there; but if you find that they must go there, then this scheme of making

their improvement there at the expense of Mr. Backus, in-1333 stead of at the expense of Mr. Joy and Mr. Gould, and of the other gentlemen who are connected with this great railroad

enterprise, it must not be permitted to succeed.

I think I have said all I want to say to you, gentlemen of the You have listened very patiently. On this hot day, to be patient and sit there and listen is certainly a very virtuous action, one of those actions for which there ought to be some reward somewhere. The prospect of reward in this world, in this instance, at least, seems to be a very slim one; I hope that you will have the supreme reward, the reward of knowing that you have done your duty; there is no reward that will endure the wear and tear of life like that; and while, perhaps, other achievements may be very pleasant, yet when the time of reflection comes, when we come to balance the accounts, those occasions on which we did our duty fully, on which both our reason and our consciences approve of what we have done, will be the occasions which will give us the most pleasure and the most substantial happiness. That is not mere preaching, it is not the mere talk of religion, it is the talk of good, manly honor; and this is one of those occasions. Here is this old man, who come's with his life's work here; he finds it imperiled, he finds that he is in danger of impoverishment in his old age; he calls on you to protect him; he does not ask you to do aught that is wrong, but he wishes you to take a fair and reasonable and business-like view. Look at this property as if it were your own property, and award such damages as you think he is entitled to, provided always that you deem it necessary that that railroad should ever come up that street at all. If you do not deem it necessary-and he says it is not necessary, and he hopes you will not deem it necessary,

he says to the railroad, Keep your money and let me stay where I am, let me finish my days here and carry on my business without being molested by your smoke, dust and cinders,

and your gas and your obstructions to my business.

I thank you very much for your attention to what I have said, and if I have been able to throw any light on the case I shall be very glad. I trust that I have said nothing in a bad spirit or bad temper. I have no feeling of that kind in the matter. The only feeling I have is that I want justice for that man. I believe his rights are being invaded, I believe his rights are endangered, and I ask justice at the hands of this jury.

Argument of Mr. Don M. Dickinson.

Mr. Foreman and Gentlemen of the Jury: Yours is, in many respects, the most tedious duty that is done in these cases. We, as 98-55

counsel, have the excitement of controversy; we move about; we examine and cross-examine the witnesses; we have the occupation from which the time seems to fly, to us; but you sit there patiently in one seat, during a session, and must take what we give you, and I know that it must on occasions be monotonous. Nevertheless it must be said of this jury that it has been exceptionally patient, none more so in my whole experience, in listening to this tedious case. It has been exceptionally intelligent, as shown by the occasional interrogatories addressed to the witnesses; and it is with regret that I feel that my duty calls upon me to still further prolong your attention to this case while I shall do my duty by my client.

And I tell you, gentlemen of the jury, that from the time that Absalom Backus was taken by the collar by this rail-

road company and dragged into court against his will, with this preposterous claim that River street must be taken by the railroad company as a necessity, I have said, while he has been harried and abused, not only in court, but everywhere, that this is a question of fundamental right, this is a question of fundamental right of American citizenship, and here I will stand and make this fight until I can address twelve jurymen of freemen and see what they think of it. It is a question which you are especially called upon to determine, and from the position which we take we cannot be driven by any violence, any vituperation, any vociferation. I do not believe that I stand before twelve men who, to paraphrase the apothegm of a distinguished countryman, will mistake rudeness for logic or violence for argument. And before I take my seat I shall give you the matter which should convince you, as I have been convinced, that there is no necessity of taking River street; no necessity of injuring Backus by running in front of him; no necessity of appropriating one inch of this River street for this elevated road. And I shall convince you, under authority and by the law. that the union depot company can take that margin of the Michigan Central road beyond the shadow of a doubt; and I am not here to urge any absurdity upon you; I am not here to urge any folly upon you, because to take an insincere position and to present one in which I have no confidence, or in which we have no confidence, after the consideration we have given to the subject, is not according to my methods or my habits. My friend on the other side has said that I wanted a jury because I thought I could carry the jury. Why, gentlemen of the jury, if I have ever had any successes be-

fore juries or elsewhere, my fellow-citizens will at least do me
1336 the justice to say that it is because I have been at least considered a sincere man, that although sometimes I may have
been wrong, my worst enemy will not say that I have not acted
from conviction, and I have not been guilty of the supreme folly of
bringing into this court before a jury of twelve men any absurd
doctrine, and such doctrine as advocated by Mr. Baker, that in the

first place there is no law that will permit you to take that margin of the Michigan Central road for the elevated railroad.

Many things have been said to which I shall not advert. Many things have been said that had nothing whatever to do with the

case; references to myself for not acting for the Michigan Central railroad; Mr. Baker says it is politics; a reflection upon me to add to the weight of whatever argument there is in my friend's argument in answering mine. Politics! and yet he cannot put his finger upon any time in the whole short history of my life when I have asked the suffrages of my fellow-citizens for myself, once. If he wants to know the reason of my not acting for the Michigan Central Company in this contest, it is because I could not do justice to the Michigan Central Company. I am over and over again employed against the Michigan Central Company, and when it infringes upon the rights of the people hereafter, as it has in the past, I hope to be still employed against the Michigan Central Company, and I do not want their money in my pockets. I do not care to be embarrassed by the retainer of the company, and I could not serve them if I would, because it is impossible for me to make an argument—whatever other men may do, I am not so constituted that I can make an effective argument or do any good work in a cause in which I do not believe. Neither do we dwell very long upon the eulogiums pronounced upon the 1337

Pacific roads; an argument that goes to this extent, that it is good to give the public lands to railroad corporations, because you can get them cheaper, that it is good to surrender them to railroad corporations because they are the workers of all good; therefore, the simple logic of it is, let us surrender to the railroad corporations, let us bow to that government, let us be a government of the corporations, for the corporations, but above all by the corporations, that they are to give us all the benefits. Uncle Sam is not rich enough to give us all a farm any more, as we used to Why? Uncle Sam has granted away all the valuable publie domain to railroad corporations. And do you know what has followed? The railroad corporations to whom the grants have been made formed a syndicate, and have put a mortgage upon all the land grants, and it has passed into the hands of succeeding syndicates, at the head of which is the distinguished owner of the elevated roads of New York. You will find that the Government domain is in the hands of syndicates, instead of in the hands of the people. You will find in your own State that your choicest pine lands, if you want to buy them, will have the sign-manual from the land office, selected for the land grants of the Flint & Pere Marquette road, selected for the land grant of the Lake Superior Ship Canal Company, selected for the land grant of the Detroit & Mackinaw road; and there is no domain left for settlers. Railroads are great blessings! We are charged with fighting a public improvement, because we sit down here and ask for our simple rights as American citizens. Let us see. This company is made up of the Flint & Pere Marquette road, with an entrance already into Detroit;

of the Detroit, Lansing & Northern, with an entrance already into Detroit; of the Canadian Pacific, which comes here simply to get the western connection of the Wabash, and the Wabash The only road that has come here is the Canadian Pacific.

road. The only road that has come here is the Canadian Pacific, which crosses the river here to get the western connection of the

Wabash. Let us see about the Wabash, this road that is going to bring so many blessings. It has been bringing blessings to us since 1879, when we were solicited here for subscriptions, and public meetings were held, and we gave, for the Butler road to bring the great Wabash here, \$250,000 in hard cash and bonuses.

A JUROR: I gave \$200.

Mr. Dickinson: You gave \$200 and I gave \$2,500; I gave as much as I could afford; as a peroration at the close of every public speech I made, and I made ten, I subscribed \$250, so that I afterwards had to pay \$2,500. We were in favor of public improvement, and in favor of the great Wabash connection; so have publicspirited men come forward, to say nothing of myself, and urged the advent of new railroads always. What followed after our \$250,000 investment? How long did it take the Wabash to go into the hands of Jay Gould, with all the property that the bonus bought, under the foreclosure of a mortgage? I am not bringing Jay Gould's name in here because his name is Gould and because he is unpopular, but that is what happened to us, and from that day to this the original investments have been cut out, and cut out, and cut out, three times, three times have new investors gone in, and three times has Jay Gould reaped the reward. And, forsooth, we are not to say nay to these corporations; we are not to assert the fundamental law of our State, embodied in its constitution, because, forsooth, they want to do certain things.

We are to be denounced as standing in the way of public improvement, we are to be denounced for taking dis-

reputable positions, when we say that this good citizen shall have his rights under the constitution and laws of the State. Let us see and consider whether they have made such a record as would make us like to be governed by them, even in their old combination. In 1881 the union depot act was passed, and although we had then in our midst 70 acres of the finest land in the city of Detroit, the highest-priced business land given up to the Michigan Central and the Grand Trunk roads, a combination was formed and the city of Detroit was advised that we were to have a great union depot down on Twelfth street, union depot for passengers and for freight, down on Twelfth street; the land was acquired for that purpose, 40 acres or more of land; in every show-window of the city of Detroit there were pictures of the great union depot to be built down on Twelfth street, up to the time that they had acquired all they wanted of the route on the river clear down to Delray. Everywhere you had pictures of the magnificent depot that was to be given you if you gave them everything they asked; and we did, and from that day to this, with the exception of a 100-foot passenger-house, and an elevator-which cannot be acquired for public use, that is nothing but a warehouse-that has been a barren waste. Where are the various industries along that line, which is now a barren waste, below Twelfth street, and where is the great union depot? The Wabash has used it, and the Wabash only has used it. Mr. Joy says they could not get the Grand Trunk to join them, and so they want to come uptown. They have come uptown, and we say,

God speed your work if you will give us at last a union depot, but you have 61 acres more for a new union depot in addition to what you had down there for the old union depot; leave us 1340 alone; you have got 107 acres of our best property, you railroads in this city, take no more, do not close our public streets. take the margin of the Michigan Central to get up to your new depot and leave the property-owners and our public streets alone. Let us see if the railroads are to take possession of us. They have made this country! Let us consider if we want to give up any more of our acreage in Detroit to the railroad companies. This is a public Chicago is a great city, built up by the railroads, or built up at the end of Lake Michigan, because it was the chief competing point with railroads to the sea by water navigation. Why, gentlemen, did you ever see a railroad magnate who invested a dollar for the good of mankind? Did he ever form a charitable syndicate to build up Detroit or to build up Chicago, just to serve mankind; or is railroading a favorite investment because it pays the largest dividends? True, railroads found business, and it was a great thing for Chicago in bringing to Chicago's wharves the grain and produce of the great West for shipment. Why has Milwaukee become a great city? Why has not Freeport, an inland city, become a great city? It was because of the great waterways of this great empire of the Northwest, the water makes competition to hold down railroad rates, that the nearest point to where shipments may be made of produce by competing water transportation will make the great city. As Chicago is made, so is Duluth being made, and so are the cities being made on the front here of the great waterways. Railroads do their part, but they do their part because they get their pay for their investment in carrying goods, getting payment from the people who are settled there, for bringing the goods, Do you know how much we ship on the Great Lakes to the

1341 East per year-just by the waterways having to use the railroads at both ends? We ship by the Great Lakes, with a tonnage for the six months and a little over of navigation, of more than enters the harbor of New York for an entire year, with open navigation the year round; we have more shipping employed for tonnage and for carrying our great products than the harbor of New York for an entire year. We ship by these Great Lakes, in value, in the course of that six months or a little over, one billion and a half of dollars. Now, do you know what we need; and I am coming right to the public question that bears upon this case. Detroit is a shipping town; you could tell that by the railroads and the elevators that the railroads have built inside of a quarter of a century. We are a shipping point on the great waterways. Do you know how much we pay out, we the Northwest and the South together, and we pay the larger portion—do you know how much we pay for changing bulks? We want to ship by the waterways, the cheapest method. You know that the producer, if the railroads overcharge him in the winter when navigation is closed. holds it over the railroads and says, If you will not ship at this low rate-they always, of course, wait until after the close of navigation—if you will not ship at the rate that will not be enough to keep my goods over to the opening of navigation, I will hold my goods until the opening of navigation; so that at all times, in the winter season and the summer season, lake navigation and waterway transportation hold down railroad rates. So, we want to ship from Detroit, we will say, by the cheaper course, the water; we ship down to Detroit and we unload; that is a tax on the producer; that is not railroad transportation just unloading; then we

put in the elevator and get taxed for storage before we ship again; that is another tax on the producer that he has to pay; next we have to pay for loading; that is another tax on the producer, outside of transportation, that he has to pay; then we get to Buffalo or to Oswego, and we want to ship by canal; we unload, and we pay for the unloading, we pay for the storage; we load on the canal and pay for the loading and the carriage, until we get to New York; then we unload and pay for the unloading; then we store and pay for the storage, and then ultimately get to the market of Liverpool, or Bremen, or South America, or any other point, with all the terminal charges, amounting to \$250,000,000. are you going to have? We are the mighty empire of the Northwest, and what is the wild dream of 25 years ago? We will have a proprietary interest in the Welland canal and the St. Lawrence canal just as sure as you and I live, and just as sure as the sun rises and sets, or we will have it in a new waterway that will widen the Erie canal and the Hudson river, and save that \$200,000,000, and we will ship to Liverpool and Bremen and Hamburg and South American ports and save these terminal charges upon our products, and Detroit is going to be a seaport. Think of it; for a quarter of what it costs us now; in one year we can make the Erie canal a ship canal to the sea and have free course for our products, without a tax from here to the market, except for what a man ships. The congressional committee have been here. They are astonished at the greatness of the Northwest, and I tell you, gentlemen of the jury, that we produced the wealth of this nation; we, of the Northwest, the great West and the South; the great Northwest pours it down from Duluth, through the port of Duluth, the great West through the ports of Chicago and Milwaukee; Michigan, with her

the port of Detroit, is pouring this immense wealth out for what? A market. And while we are producing this great wealth, we who produce it, because they produce no wealth in the East, they make their money handling our produce, that we produce, the raw material that we send up to them, they make their money in handling that and in manufacturing it, while we, of the Northwest and the South, are having a struggle to live, we producers, because we have not a market, we cannot get a market without this enormous tax upon us. A company has been formed already, a Liverpool and Chicago company. The Welland canal today has been twice widened within 15 years by the Canadian government; a company has been formed for a line of steamships, of freighters built in a cigar-shaped form, to carry products from Chicago to Liverpool.

That has already been done. The canal is too narrow now for our great ships, we must have that way, and we can make it on the American soil for a quarter of the tax we pay for terminal charges in one year. You are going to have a great city here, are you not? I believe it. You take this city map, and see how much front you have got left to get to the sea without having a railroad occupy it. The space is between the foot of Brush street, if the Grand Trunk has not already bought it, towards Woodward avenue, but the space remains for us to get to the water, to this great waterway of commence, only between Brush street and Third street. First comes the Michigan Central to Twelfth street, from Third to Twelfth, nine great blocks; then comes the old depot grounds of the Wabash, from Twelfth street to Eighteenth-and-a-half street, 6½ great blocks; following below that, what follows? Why, that little joker,

the Detroit & Transit road, that connects the union depot company with the outside tracks of Delray, runs along from 500 to 1,000 feet from the river bank, the whole distance down, and you cannot get to that waterway without saying, By your leave, Mr. Railroad Company. You have now in the city of Detroit, you whose taxation is increasing, and has so increased that it is now 16 or 17 mills to the dollar, you have 107 acres of your highest-priced real estate for which you pay a tax, if you own it, of the same kind that you pay taxes on-you have that 107 acres entirely free from The shipping, which gives you competing facilities and holds down your railroad rates, pays a tax at the assessed valuation of the full value of the property, to wit, \$28,000,000 on vessels here and warehouses on the water line owned here on the docks. The taxes are increasing. Are you ready to give any more to the railroad companies of this land, unless you are obliged to? Is it not enough, when the New York Central depot does all its business. with 244 trains a day, on a little piece of six acres, when the New York Central road, and the combination of roads coming in there. cannot afford to own real estate in the business part of New York, because it is taxed; they cannot afford to own real estate to do their freight business on in the central part of New York, when freight business can be just as well done down on the river, or in both places. In Chicago, on Dearborn street and Canal street, in Indianapolis and St. Louis, not one of them, with the exception of St. Louis, has to exceed nine acres to do all their business on, in the central portion of the city, where the business property is in demand for other business, not one of them; and they do their freight business in the bottoms, or where the property is not good for central busi-

ness. I tell you, gentlemen of the jury, that it is a public question. They shall have their 6½ acres to build the great union depot, if they will only give us one, but do not you let them close another street, unless the law compels you to do it, especially River street; do not let them interfere any more with legitimate industries of this city. I saw my brother Baker sneer when Judge Chipman said that Backus employed more men than did the Central Company at its depot. I took occasion to inquire about that. It has more men on its railroads, but most of them do not live here.

It employs more men in running its cars and locomotives and freight cars in going in and out, but the great depot itself does not employ but 50 men. It won't do to surrender to railroad companies. anxious as we are, and as we have demonstrated we are, to have all the railroad facilities come here that will come; it won't do to surrender private and public rights, public ways and private business to a railroad company or to railroad companies. It is a pretty old doctrine in this corporation-ridden country that the corporations rule, that the king can do no wrong. Let me read to you the strong words of Justice Morse. You will remember that some time agosix years ago-the State was roused and believed that the court of last resort was partial to railroads, that the railroads were not only controlling the lower courts, but at last had got their hands on the supreme court, the court of last resort. When the people came to believe that, without regard to party, they rose as one man and put that distinguished lawyer who was suspected of railroad affiliations from the bench, that great judge, Thomas M. Cooley, and put a people's candidate, who was not suspected of affiliations or of partiality for railroad corporations, upon the bench by a majority of all par-

ties. The people of this State, through their conventions, 6 and the conventions are what my friend sneers at, expressed

their opinion about it, the people sustaining them. You are going to hand over your lands and private property to railroads, are you, to do what they please with, according to their own sweet will? Let me read something to you from that man whom we put on the bench, and who has not proved false to the people who put him there. It was not a Democratic upheaval or a Republican upheaval; the people put their foot down upon railroad domination in the State of Michigan. It is not anything to compare with this case, but a Detroit street railroad company on a narrow road. I do not believe myself that an electric road will hurt a broad street, but on a narrow street, which you know very wellthe Mack road, which had not been graded—they put on an electric track, with wires strung transversely from pole to pole, so that a load of hay could not go by on the grade between the track and the side of the street. It was a public corporation, for the public benefit, walking over private rights, and walking over W. D. Mills and all these people. It was nothing but a little electric road, but the principle was there, and two of the judges held with the railroad, that it was a great public benefit, and was no such damage that the people could complain of. Those judges were Judge Grant and Judge Long. There are five judges. The action was on the part of the street railway company to restrain the people from cutting down the poles. When they put poles on the street that stood in the way of the people getting out in the road and using the road in the ordinary way, I told them to cut them down, just as I took down the electric light pole that they put in front of my front door. Judge Champlain says that inasmuch as the use of this street is an additional

says that masmuch as the use of this street is an additional servitude, inasmuch as the road has gone in a narrow street, we will not grant an injunction on the cross-bill to restrain the construction of the road; that would be useless, because the road is

constructed; but it is a new servitude, and the road must pay damages to every property-owner for taking his property. So you see Judge Champlain concurred, refusing the injunction to the propertyowner, and the injunction did not go, but he agreed in principle with Morse and with McGrath, that they could not take that property; so that there were three judges against two, that the injunction did not go but these men have their remedy for damages for taking the property; they gave them a remedy by a majority of the court.

I want to read to you some words of that man that the people arose in their might and elected. They are pregnant, as Brother Chipman says, with something that we do not hear enough about except on the 4th of July, and that is American liberty. apt to prate, just as we go to church-we are apt to prate on holiday occasions on American liberty and the rights of man, just as we go to church and hear the creed, and see the beautiful altar, and the beautiful pictures and paintings and stained glass; we admire it at the time, but we do not take away much religion with us, I fear; we do not get it there; and so, on the 4th of July, we put up our orators on the rostrum, and we hear speeches upon American liberty and the rights of man. I am speaking of the church that I sometimes attend; I admire the beautiful stained windows and the beautiful altar and the pulpit, but I have yet to hear anything that touches my religious feelings and touches my heart in the churches

that I have attended. It is very lovely, and I admire it. And so we are apt to wait for the 4th of July orators to talk about the

principles of American liberty, instead of writing over the door of every palace and every cottage the living principle, and making it a rule of action in our daily life, and see it as we come in and go out of our homes with our families-" Eternal vigilance is the price of liberty." We should live by it, we should see it as we go out and come in our homes, we should train our children in the principles of liberty, and say it is a good thing to have it come to them, and come strongly from this man that the people put upon the bench, upon the question that threatens American liberty more than any other question at this time—the question of the domination of cor-

porations. I will read what Judge Morse says:

"The fact remains that no land-owner wants such a railway upon his street in front of his home; that it is a means of travel not contemplated when most of our streets were dedicated; that the poles are unsightly, and a damage to the premises of the abutter; that the wires may and have been the means of injury and death; that the cars are more dangerous than horse cars, and more liable to frighten animals; that such a road depreciates the value of land as residence property upon the line of such road, and that it is a positive damage to the abutting land-owner. Why, then, is not his property taken within the meaning of the constitution, and taken without compensation? Why should his property rights be disregarded? It can only be justified, as before said, upon the plea that the convenience of the public is so paramount to the rights of the individual that the property of the latter must be sacrificed without recompense for the benefit of the public. We have heard 99 - 55

this argument before. It has been more than once made in this court in favor of the great lumber corporations of this 1349 State. It has been contended that the lumbering interests of

this State were so extensive, important and valuable, and so identified with the interests of the public, that the poor farmer, with a small piece of land upon a navigable stream, must bear the servitude and burden of damage to his land by flooding of the streams and running of logs without compensation because the public would be benefited thereby; while this argument has been listened to, it has never yet been accepted by this court as sound doctrine, and thus far the poor and weak have not been denied the equal justice of our laws." And he cites the cases, "The doctrine contended for is but a phase of the old idea that the King can do no wrong. It cannot prevail in a free government. The individual in a republican form of government is the one to be protected and guarded, and in his protection lies the security of liberty to the whole people. If the need of the public demands this kind of a railway for rapid transit, then the public can afford to pay for the privilege of destroying the property of the individual citizen. In no other case that I know of has the home of the individual been permitted by the law to be damaged without recompense, that the public might reap a benefit. If the need of the public is such that it must have this particular method of transit, that need will furnish corporations with means to repay every private citizen for the loss and damage that his property must suffer to accommodate such public need. The plea that electric railways will not be built unless the property of abutters upon the street is permitted to be taken or damaged without compensation, is too puerile to be considered as an argument in favor of the destruction of private rights."

I need not read the strong statement of Chief Justice Morse in favor of all proper facilities and the conferment of rights and opportunities to railroads to enter a community, "That is so," says Judge Morse, "they are a great public benefit, but the one thing that government is called upon to conserve and to protect, and which our constitutions protect, is the individual and indi-

vidual rights, and thus may the whole people be free."

Adjourned to Tuesday, July 14, 2 p. m.

Tuesday, July 14, 1891-2.10 p. m.

Argument of Mr. Dickinson Continued.

MR. FOREMAN AND GENTLEMEN OF THE JURY: I had endeavored to recall to your minds, rather than to advise you, how valueless are our professions of the principles of American liberty, how valueless is the government of we the people, unless we apply the principles of liberty and of free government in matters of everyday life to the individual. You will find no test of those prizes and muniments of liberty embedded in the Constitution of your Federal Government, and in the constitution of your State, except that

those tests be made in the case of some simple, plain citizen. You never can apply those tests, gentlemen, against a collective body of we, all the people. They are good for nothing unless they avail to the single humble individual, and after all government is established to protect your life, to protect your liberty and to protect your property, and the right to use it if you please. That is all the government gives you after all, taxes you equally, keeps your burden down, not steal from the public treasury for the sup-

1351 port of the government, tax every one equally, see to it that no one is imposed upon in his property, in his person, or in his liberty. That is all there is of this Government, all there is of our

vaunted free Government.

And now let us make a personal application, a direct application of the general principles to the case at bar. They are the A, B, C of American freedom. It amounts to little to say that in these exist American freedom or that in these things is the protection of American freemen, unless you make the practical application, unless you take your Liberty down from her pedestal, where she wears the liberty cap and the gown, and put her down in plain calico by your table in your kitchen, in the cottage, in the palace, everywhere, and live with her and she with you. So that we will see what all this has to do, aside from its being something of the pyrotechnics of Fourth of July speeches, what it really has to do with plain every-

day life in the case of Backus.

In the experience of mankind, from which we learned a lesson, from which we formed our own constitution, our last constitution, it was found that the legislature of the State, the highest legislative power in which governmental functions were reposed, the legislature of the State, could not be trusted with private rights, that is, it could not be trusted with the decision of the question of whether a combination of men could lay out a route and take the property of a private citizen for their business enterprises. Why? The legislature, it was found, could not be trusted with the power of making special legislation. Why? Not because the legislators could be bought, but because when you get a great body like the legislature of Michigan, with representatives from every part of the State, and

there was brought before it the question of whether some 1352 citizen should suffer, or whether some citizen's property

should be taken, in the city of Detroit, or in the township of Dearborn, or in the township of Wayne, or in some other special locality, there was no one to protect the individual's rights for that locality except the representative, and the whole body of representatives from all parts of the State cared little about it, so that the constitution provided that the legislature should not be trusted any more with this power of taking private property, it should not be trusted to make special legislation affecting only one body, or one person, or one locality; it should not be trusted, because it worked hardship, because, applying the principles of American liberty to it, it worked just the oppression that was worked by the old monarchial forms of government, when the strong hand of power took private property. That was why. They said, We will not leave it to the legis-

lature longer, we will not leave it to a general body of men, even without regard to the question of whether legislatures can be corrupted; they are not interested, and there is no one to defend the interests of the poor man, or the special locality; the whole body of the State are not interested. Therefore, it was decided in the constitution of 1851 that it should be provided that no special legislation should be had; that if the legislature passes a law affecting any body of citizens anywhere, that legislation should affect the body of citizens all over the State, so that if a piece of legislation was sought for Detroit, every legislator in that whole body should be interested in it, because he would be sure, if it were not special legislation applying solely to Detroit, under the constitution, every legislator in that body would be interested in it because it would

apply to the whole State of Michigan; it might apply to
Kalamazoo, or Grand Rapids, or Marquette, as well as to
Detroit, so that the whole body of the State could see to it
that no injustice should be done and no unjust legislation should

be passed.

That was to secure private rights from the strong hand of unadvised power. It was to secure private rights from the equally strong hand of corruptive power, if the legislature be corrupt. So it was said, Mr. Corporation, railroad corporations, seeking to take rights of way away from the citizen, you shall no longer apply to the legislature with such methods as you can get through to take private property; the legislature shall no longer lay out a route and take private property; no one shall do that in the legislature, because the great body of the people are not interested in the route that runs, for instance, from here to Jackson. The people of the northern peninsula, the people of the upper part of the lower peninsula, the people of the western part of the State are not interested in that, and will give it no care; therefore, because the care of the representatives were not exercised for the protection of private rights, the constitution provided that the legislature shall no longer grant rights of way, shall no longer grant property of private citizens. Whom shall we vest it in, say the people? We will vest it in a body of men from the locality of the interested parties, to pass upon the question of the rights of their fellow-citizens in the proposed enterprise, and we will leave that question to them, whether the route is necessary that they have selected-whether it is the best route. We will leave it to 12 men from the vicinity, neighbors of the man whose property is to be taken. It shall be vested in those 12 men, or in three commissioners, if the property-owner prefers.

prefers. It shall be left to men from the vicinity, who are the best judges of the locality; it shall be taken from the legislature and vested in a new tribunal, created by your constitution, created by the muniment of your private rights, over and above legislatures, over and above law or legislation; it shall be handed over to referees, 12 jurymen of freeholders, who also own real estate, and therefore are interested in protecting the private rights, from the vicinity, from the locality to be interested, and these shall say, first, whether this body of corporators have laid

out a road which is for the public use, and have taken the best route and the most necessary route for the public use; whether it is necessary to take it at all, and consequently whether it is necessary to take the particular lines sought to be taken. Second, if they find the gentlemen who are familiar with the locality, familiar with the interests, are tax-payers in the community, are freeholders like the men whose property is sought to be taken, if they decide it shall be taken then they shall say the man whose property is taken shall not suffer one penny's damage. There is the tribunal made by your constitution. It is left to you, just as much a governmental function, placed near the people, in 12 men from the people, vested with just as high function, for the time being, as that of the governor of the State, or the whole legislative body, or any other governmental power. The responsibility is upon the jury, and the whole question submitted to it, as it used to be upon the legislature of the State.

They passed a union depot act, and in that they provide a piece of legislation which is in conflict with the constitution of the State. One reason why I suggested that fair justice required that we should reply was because the learned counsel upon the other side, or the corporation counsel, will make statements that ought to be

replied to, and you will remember that here where I said, 1355 notwithstanding he read from the statute that you might be attentive, and be instructed in the law, by the judge or circuit court commissioner to be appointed by the court, when I said to you that the constitution of your State provided that you were an independent body, independent of the judge, that the constitution of your State assumed that you could read and write, assumed that you could read a statute and knew what it meant, as well as any representative in Lansing who framed it, when I said you were to do this, by the constitution of your State, that the responsibility was yours, that the matter rested upon your own consciences, that you could not evade it, and if you did, you did an injustice-when I said that, you remember the speech that Brother Baker made. He rose, and his first words were: "I desire to contradict the statement made by the counsel that the judge cannot interfere here; I tell you he has a right to direct you." And I said to you then, in answer to that tirade, that I would reply at some time, and when I had an opportunity, I read but one authority. You will see the reason of Why are your representatives in Lansing? This question is the matter of what a statute means, gentlemen, a plain statute, with good, plain English words in it. The constitution of your State contemplates that you are just as able to read that statute as the men who made it. It is not a question of common law. It is not a question of general jurisprudence, as to which you may have doubts, and need a distinguished judge like my brother Chipman to elucidate it to you. It is not a question of general law; it is a question of statutory law. The constitution assumes that every citizen of this State, if he will read it, can understand thoroughly every clause of the State constitution, and he can. It is un-

1356 derstood, it is assumed by the constitution that every citizen

of the State thus called upon to serve upon a jury of this kind, exercising a high public function, can understand a statute when it is written in plain English. That is what the constitution contemplates, and it contemplates that you shall not be interfered with in your construction of that statute. The constitution says you shall not be, that you twelve men are to pass upon the necessity, and the compensation, if any. Nevertheless, Brother Baker, at the outset, said to you that it was not so, that the judge had given the matter no examination, and without any reflection upon any judge, he said it is not so, that a judge, forsooth, of the circuit court, from whom the power has been expressly taken by your constitution, taken from it by the same instrument that took the power from the legislature, that a judge shall come here and direct your consciences.

It is not true. Do you think you can read a statute as well as Senator Smith from this county? Do you think you can read a statute and understand what it is as well as the men who made it, the farmers and business men of the State of Michigan. There were only seven lawyers in the last house. Can you understand a statute that is made by Senator Smith or White, the furniture man of Grand Rapids, and Richardson, the farmer? Do you think you can read and understand a statute that was framed by our friend whose chair is here vacant, Senator Greiner, who was a member of the legislature? The legislature is made up, under your constitution, of men from all parts of the State, who can read and write the English language, and say what they mean, and the constitution says that a plain statute, made by such men, can be read and construed, on

this question of private rights and on this question of protection to private property, can be read and construed by the same class of men, freeholders, from the community where

the citizen's rights are at stake.

I read to you from the 47th Michigan, and to show you how necessary it is for you to attend to this case yourselves, how necessary it seemed to me to reply to Brother Baker, to show you how careful you must be not to be misled. There is no position which he has taken with more strength and more vehemence than that we were wrong on this matter of the judge, and I have read to you the 47th of Michigan, putting it down by the language of Chief Justice Campbell, that language, as has been stated by my distinguished friend, instinct with American liberty, I have read that to you and shall not read it again, but to make it more emphatic, he talked again, and I will read from that.

I read to you a decision from the 47th of Michigan. I now read to you a decision, and one of the last ever rendered by the same great jurist, the same great citizen and jurist, the same friend of private rights, personal liberty, and of constitutional freedom, who stood there for 30 years, and said to corporations, Thus far and no farther. I am not reading a decision that I read to you before, showing to you that this is not a judicial tribunal by you, a jury of referees, a constituted body, created by the fundamental law of the State, upon whom was incumbent, not merely the privilege—note

the distinction, gentlemen—not merely the privilege to do this thing, to pass on the necessity of taking the right of way, but the duty, the duty sworn to be performed by you without fear or favor, the duty of passing upon the question of necessity, without let or hindrance from legislators, from whom the power is taken, and

without let or hindrance from any other constituted body, be
1358 it judge or what. It is your duty you are sworn to perform, and you cannot, without violating your oaths, construe
this plain English statute, except according to your own consciences:

you cannot construe it according to the direction of anybody. I refer to the case of The Railroad Company vs. Chesbro, 74th Michigan, 466. These were condemnation proceedings. The petitioner began proceedings to procure by condemnation a right of way over 40 acres of land owned by respondents near Grand Rapids. Says Judge Campbell: "The proceedings before the jury appear to have been conducted in a peculiar method, not within the proper rules governing such cases, and appear to have led to conclusions that cannot be maintained. The probate judge acted throughout as if he had been a nisi prius judge, presiding over a common-law jury, and assumed the whole responsibility of directing what testimony should go before them, and on what theories of damage. he charged them or not does not appear, but his rulings on evidence had practically the same effect. Whether the constitution will suffer the jury of commission of inquest to act in a court of common-law jurisdiction under the conditions applicable to other juries, is a very serious question, but, so far as we know, it has not been attempted. The constitution in such cases as the present requires either commissioners appointed by a court of record, or a jury of freeholders to determine the necessity of public use, and to ascertain the damages. Commissioners form no part of the machinery of a court, and a jury of inquest is not a court. It has always been settled that the appropriation of private authority did not come under

the 'judicial power,' as it is located under the constitution in courts, and except for the constitution the nature of the 1359 tribunal of condemnation would have been discretionary with the legislature. Highway commissioners act on the location of highways, and under the old constitution public commissioners condemned land for State railroads. In the railroad special charters there was no instance of action by a common law trial jury. Then, as under our present statutes, the jury was a jury of inquest, specially created, and not a trial jury. We held in Toledo, etc., Railway Co. vs. Dunlap, 47th Michigan, 456, where the jury was impaneled in a circuit court, that the only functions of the court were to set the proceedings in motion by organizing a jury, or appointing commissioners, and affirming or vacating the award; and we held, further, that the jury were judges of law and fact, and not subject to interference by the judge, should he undertake to go with them."

If that is not enough to answer the wonderful and vociferous and extraordinary, and almost abusive speech in reply to my suggestion, of the learned counsel, I give you a case decided recently, following

Judge Campbell, and since his death, to show that the court will not change its ideas of what the constitution is, because Judge Campbell is dead. He left a record of a judicial mind. He has left a record of defense of the people's rights, which is a palladium of liberty in itself. This was the case of this Union Depot Company against Jones, 83d Mich., 415, decided only a few months ago, December 5, 1890. Mr. Baker was in the case, and the opinion was delivered by Justice Grant and was concurred in by every justice. It was objected to the introduction of testimony, that it was illegal, and it was insisted that, because the testimony was illegal and contrary to the ordinary course of the trial of cases, that the

1360 verdict should be set aside, but the court said the jury can do as they please, it is a jury of inquest, independent of the court, and they hold that the case is ruled by the case in the 47th

Mich., which I have read to you.

Now, are you going to believe me after I have read from authority, or take this vociferation of counsel. You see the difficulty. Brother Baker says, in his argument, that the jury are the judges of the law and the facts. But you are sworn in the case, in nisi prins, to follow the directions of the court. You have to take your law from the court, and if you disobey the judge in a ruling upon the general propositions of law, your verdict will be set aside, and you violate your oaths. In this case you are the judges of the law and of facts. This is an independent case. There can be no such questions as of general, abstruse and abstract law to come before you. You are governed entirely by a written constitution in cases like this, and by the law, no unwritten law, such as the common law. You are governed by statutory matters, framed by men not nearly as wise and discrete as this jury. You are supposed to be capable of reading and of understanding.

Now, gentlemen, that constitution says you shall pass upon the question of necessity. But my friend says that the route has been submitted to the railroad crossing board, that the route has been submitted to the common council. He has said to us there is the decision of the common council on the question of private rights, as against a corporation, that the common council has passed an ordinance, that the railroad crossing board has approved it, that the legislature has granted the privilege of forming the corporation,

that the engineer has laid out the route. What have we got?

1361 Let us see what becomes of your functions, and when we get back to it we will find that all the pains of the fathers of the constitution went to naught. You must find that they did not know anything about their business. No danger to the people, or to private rights, or to personal liberty, or to private property from railroad companies combining and laying out a route and taking property not necessary. You must find that they did not know what they were about when they said that a tribunal of twelve men should be established. Just as well obviate all that trouble in the constitution and all the debates necessary to put that clause in the constitution, if they had only known, just as well have obviated that and handed it all over, to

whom? To Mr. Ellis, the engineer of the union depot company. because Mr. Ellis, swears that he was formerly the engineer of the Butler, the old Wabash connection, that he laid out this route as it is up River street himself, without consultation with any other engineer, or with anybody. That he never examined the Michigan Central route, because Mr. Baker had him swear that he was advised by counsel he could not touch it; that he never exchanged a word with any other engineer or any other living man about it. He laid out the route and submitted it to the board, and there never was a change made in it, there never was a post taken out, and another post put in, from the time he made the structure and chose the route. That is what he swears distinctly. What is the use of this trouble if Mr. Ellis is to decide? It is his structure and his route. What is the use of your constitution providing with the utmost care, that the legislature of the State cannot direct it, that the tribunal to pass on the necessity of that route shall not be left to Mr. Ellis, or the engineer, or any body of railroad men, it

shall be left to you twelve men. Let Mr. Ellis fix it, and ignore the constitution, throw away the safeguards of private rights and discharge the jury, and leave it to Ellis, the general engineer of Jay Gould. Why not? That is what it comes to. Is there any mistake about it? Any change in his route as originally laid out? Did he consult anybody? No. Did the crossing board have anything to say about it? No. All the crossing board has to do is this, the engineer submits to the crossing board a plan to cross another railway and they say that is feasible, but you cannot cross unless another State agent, a State agent called a jury of twelve free-holders, shall say to you, Mr. Ellis, that that route is necessary. We simply say it is feasible. That is all the crossing board can say.

What else have they got besides Ellis and the railroad crossing board? They have got the common council. A wise thing, was it not, for the constitution to provide that a jury of twelve independent freeholders should be called to pass upon the question of route and that the council should not? Very wise. Look at the municipal legislation of your council for five years last past, and admire the wisdom of the constitutional fathers who put this in the constitution, and set you over the common council. Admire the wisdom of the fathers who knew the frailty of human nature and set you over legislatures. Admire the wisdom of the fathers who knew the frailty and the greed of human nature and set you over corporations, and corporation engineers. You are to pass upon the question of the necessity of this route. O, you are going to advocate your functions. Gentlemen of the jury, as this elevated road crossed River street, crossed from the old depot grounds and entered River street, who was at the threshold when they started in? Backus.

1363 Backus said to them, when he was called into court, you cannot go here until a jury of my fellow-citizens say that it is necessary for you to come up that street. Abdicate your functions, because after their trial and failure, we stand here at the threshold of your entrance upon this route, we have the first suit, we are the parties most to be injured. We are right at the commencement of

100 - 55

your steep grade, we say to you that you cannot come here until a jury say that this is necessary. Will you abdicate your functions because after attempting that and failing, they went further and got in more property there, in lawsuits, in one lawsuit that I know of, where the question is not determined, or how do you know it is determined? Are you going to try those over again? The first suit to which they were invited was here, at the very threshold of the union depot, behold us. You cannot go up this street with your union depot railroad until a jury of freeholders say that this route is necessary. Can they make you abdicate your functions by urging upon you that after they fought and lost the first suit, the question is fairly presented that after that they have gone on and acquired some property from widows and orphans, or whoever they may be, or they tried some suits of men that did not know their rights, or even if they did try a suit with men who did know their rights and try the question, are you going to abdicate your functions to pass upon the question at the threshold of the enterprise? This is your duty, and the procuring of other land above there, for the very purpose of using it before this jury, so that you will say, We will not do our duty down there, they have acquired other rights above, we will not do our duty and say it is unnecessary, be-

cause they have gone on above us and got some property. Can you do that? Will you submit to being bulldozed in that way, when they knew and were advised day by day, week in and week out, in the former trial of this case that failed here for a verdict, the first case, that they had no right to use this street? You stand here today as if you were in the seats of that jury who first heard the

question, uninfluenced by any subsequent consideration; to say that is what we are here for, or you would not be summoned to say whether it is necessary.

Now, gentlemen of the jury, the taking of private property for a railway company and the holding of it is not a holding for a public use. And as I go step by step I do not ask you to take my assertion, and I do not want you to take any garbled statements of authority; I want you to read them. I am going to leave the paper in the books. As I go step by step, to convince you beyond a shadow of a doubt that these people can go up the margin of the Michigan Central road, by the law, by the authority, by precedence of which

there is no gainsay.

Now they had a great fight about the right to take railroad property for public use. The railroads used to insist that even with reference to crossings they ought to go around, and no other railroad should touch them, competing railroads especially, and the question came up as to whether the property by the railroad originally was held for public uses, and whether it could be taken for another railroad company. Let us see what the courts say about that. In the first place, it has been urged over and over again, and let us have an end of heresies on this question, it has been urged over and over again that a railroad corporation was a public body, that it was a public servant, and

the same has been urged by the railroad companies as a reason why they ought not to pay taxes any more than your county houses and your school-houses, and your court-houses and your jails, and you know the theory is if you get a special act of legislature authorizing you to take a jail or a public park, with the consent of the city, or any other public holding, if you get a statute to take it for some other public use, you do not have to take it, because it is the public's anyway. So that railroad property, when it is held, taken because the public necessity requires it to be taken, under the rulings of the courts, to enable the railroads to make a straight road, after it is taken, it is held by a private corporation, and it is not beyond the reach of the power of eminent It is not beyond the reach of the power of any other corporation to take it, if it can show that it needs it. Let us see about this public business. Do not let us confuse terms about private and public holding. I read from the Salem case, 20th of Mich., 452. first from Chief Justice Campbell:

"Unless railroad companies can be regarded as in some way representing the public, then they cannot stand before the law on any other footing than private citizens. So far as their business is concerned, they furnish, on a large scale, and in a more perfect way, the same benefits which are extended to the population by other carriers, by land or by water, and benefits quite similar in principle to those conferred by enterprising hotel-keepers, millers and others, who find it to their profit to entertain all applicants impartially. They benefit the municipal corporation of the State in their corporate capacities in no way whatever, beyond paying their taxes, for which they are presumed in law to get a full equivalent. They benefit the neighborhood, large or small, in the way that all

other business and enterprise aid it, by increasing population and stimulating commerce and industry. They do on a large scale what every industrious settler does on a smaller scale, and they do it just as every private person is supposed to conduct his affairs. primarily for his own benefit, and incidentally for any advantages that may follow or attend their private success to the benefit of There is nothing in the nature of their business which distinguishes them from any other persons, so as to make it in any legal sense a public undertaking. It is said, however, that by the exercise of the right of eminent domain they are affected with a public character, and become invested with public functions. the exercise of this power is never valid except on behalf of some public agency, then it might follow that it could not be used on behalf of these companies. It is reasoning in the wrong direction to determine the character of the beneficiary from the fact of its use. But it has been customary from time immemorial to allow lands to be taken for turnpikes and canals in the hands of private corporations, because the land could not otherwise, as a general thing, be obtained for the whole line. The fact that the work was one of general utility, and that no work of that description was possible without the exercise of this power, has created precedents that were

readily applied to railroads. They were always founded on neces-

sity, and were the extreme application of a power, which, in a much smaller degree, has frequently compelled private owners of property to submit to some obligations whereby their neighbors might be enabled the more securely and conveniently to use theirs. In some cities in England, by ancient custom, there were regulations concerning party walls, drains and the like, which rested on 1367 similar principles, and, in some cases, modern legislation has

followed the same road."

He proceeds to illustrate that principle. Judge Christiancy lays

down the same doctrine as follows:

"This theory at the first view seems plausible and just. A little reflection, however, and a recurrence to the fundamental principles upon which corporations are created by the State, will readily demonstrate that this theory is unsound upon any legal principlea mere legal fallacy, and no more just than sound. These incidental benefits which railroad corporations thus confer by the construction and operation of their roads, are the only consideration or compensation which they pay, or which the public receives for the large powers and exclusive privileges which the State has bestowed upon the corporators beyond those enjoyed by the citizens of the State generally, including the exercise of the sovereign power of eminent domain, and which, but for those incidental benefits, would be wholly unjustifiable and highly injurious to the people of the State. No one can fail, upon a little reflection, to see these incidental benefits constitute the sole inducement and only possible justification to the government for the grant of such important and exclusive privileges."

Now, in the same case, Judge Cooley speaks of the powers of the

Michigan Central railroad, at p. 480, as follows:

"The Michigan Central Railroad Company makes a business of transporting persons and property over its road for the profit of its stockholders, but at rates which the State has regulated, and on the condition which the State has prescribed, of furnishing impartial accommodations. It does so, moreover, under a charter from the

State, from which it derives its authority, and for this charter it has rendered, or is supposed to have rendered, a com-

pensation. The hackmen of Detroit make a business of transporting persons and property over shorter routes for their own profit, and in like manner, at rates which the law regulates, and on

like conditions of impartiality."

Public necessity, they say. So is wheat a public necessity, but you do not give a farmer all the ground he wants to raise wheat on. A hotel is a public necessity, if you come in here from the country; but the hotel company cannot condemn property and say we want it for a hotel. I remember, in Washington, the Arlington hotel having extended itself into the Sumner house and into the old Cass mansion, and into Reverdy Johnson's, the proprietor took a notion that he would like to have the property of Mrs. Henery, a very wealthy widow lady who lived above him on F street, and he addressed her a note: "Madam: The Arlington hotel would like very much to extend its hotel facilities and would be obliged if you would

put a price on your house." The reply was something like this: "I would like very much to extend my flower garden; would you

be good enough to put a price on your hotel?"

The record was first examined by Rufus Choate in a case where Frederick the Great wanted to build a palace in which the Kaiser lives. I read it the other day in the life of Rufus Choate. He had gathered the statistics and the details of the proceeding. Emperor who was then King, wanted to extend his palace, to rebuild it, and there was a little cottage down there in one corner. They got all the other property-owners to clear out because the King wanted to come there, but this little fellow lived there, and his

father had lived there, and his grandfather had lived there, and he kept a little bit of a garden back of his little cottage.
